There are two main types of statistical information which throw light on the facts of unemployment—employment series and unemployment series. The former type shows numbers on employers' pay rolls at a certain date in each month. The traditional way of deriving this information, as developed in the U.S., was to conduct a sample inquiry among employers in different industries every month and to check these reports against the periodical census returns. Direct unemployment series have been obtained by a number of different methods. The oldest is data based on trade-union returns. In the 20th century this has given way to such methods as employment exchange data on persons seeking employment or social insurance data on numbers registered as unemployed or monthly sample information on unemployment Finally, estimates by private bodies, such as those of the National Industrial Conference board in the U.S , have sometimes been the main source of information.

Deficiencies of Unemployment Data.—All these methods have theoretical disadvantages as indicators of unemployment. The employment data are obviously of much less value than the unemployment data; for it is quite clear that if the total labour force is increasing through immigration or larger population then total employment may increase, and yet at the same time unemployment may not diminish and may even increase.

The only real reason for using employment data at all is that they often cover a wider field than unemployment data and, provided there is some general knowledge of the changes occurring in the labour force, may, if used with care, give some useful information Of the unemployment series, there are obvious deficiencies in trade-union data, whether of the Danish type (based on trade-union unemployment insurance fund data) or the Australian (direct reports from union secretaries). The value of data derived in this way depends entirely on whether the workers in any one industry covered by a trade union are typical of all workers in that industry and on how many industries are covered by trade unions. Employment exchange statistics may also be misleading if, on the one hand, they do not cover all workers seeking employment, and, on the other, include those who are actually at work (*e.g.*, on a part-time basis) or those who are totally incapable of work. In many ways, social insurance data are much superior but even here a number of snags arise. These data often exclude certain industrial or occupational groups such as agricultural workers (the scheme in Great Britain covered this category only after 1937). The treatment of long-term unemployed who have become ineligible for benefit always gives trouble And then there are always a number of "fringe" workers who for one reason or another do not (or are not entitled to) register as unemployed but among whom the percentage incidence of unemployment is usually higher than among those properly within the scope of the scheme.

For these reasons it is usually the case that social insurance data underestimate the amount of unemployment. In some ways, the sample survey of the type conducted in the U.S, and Canada is potentially the most accurate means of assessing unemployment for there are no restrictions of coverage because of date of entry into industry, age, kind of industry, occupation or sex. The chief deficiency is that, to count as unemployed, a man must be without work from Monday to Friday or Saturday in the inquiry week and therefore unemployment for shorter periods than five or six days tends to be ignored in the statistics. Little can be said at this general level about private reports on unemployment; their validity and usefulness obviously depend on the particular methods adopted.

This summary of the deficiencies of the various types of data should be sufficient to guard against too facile acceptance of published figures at their face value. But at the same time it must be made clear that, despite deficiencies, there is a wide measure of agreement among administrative definitions and treatment of unemployment which does in practice help the solution of some complex theoretical problems. Typically, it is not construed to be reasonable to force a person to take a job vacated because of an industrial dispute or to accept one which pays substantially

smaller wages or requires more hours of labour than those which obtain in his usual occupation or are prevalent in the community where the work is performed; or to expect him to make unusual sacrifices. In such cases as these, men are usually reported as being unemployed and there is no disharmony here with the theoretical points discussed. Similarly, common sense definitions are usually adopted to decide when a man is too ill to work and (except in the case of the sample surveys) to deal with unemployment lasting for periods of less than a week. On the other hand, insurance regulations usually refuse to recognize for benefit purposes unemployment resulting from voluntary quitting (unless through acts or conditions attributable to the employer which justify such quitting, such as injustice, acts of persecution or unreasonable changes in the conditions of employment) or loss of a job because of misconduct. Here there is some disharmony with theoretical requirements, as such men are clearly still in the labour market; therefore, this is another case where the statistical measures of unemployment may underestimate its extent.

World Statistics.—Having examined some of the general characteristics of unemployment statistics and noting their merits and demerits, the next stage is to survey the statistics and see what general comments about unemployment can be made.

Table I is an international employment series from 1929 to 1947. It shows changes in employment in a number of important countries in manufacturing industry alone and in mining, manufacturing, construction, commerce and transport. Despite the general increase in world population in the 1930s, the influence of the very heavy unemployment of 1932–33 and, to a lesser extent, the slump of 1938 can be seen in these figures.

Table II, however, is much more useful. Here are given statistics of the percentage ratio of unemployment to total numbers seeking work for Canada, U.S., Denmark, Netherlands, Sweden, Switzerland, Great Britain and Australia for a number of years between 1929 and 1948 and also an average for 15 countries for the years between 1929 and 1938.

It should be emphasized that these statistics differ considerably in coverage of the respective labour forces and to some extent in definition of unemployment, and therefore direct comparison between countries is rather hazardous. Nevertheless, they are most useful for showing the general experience over this period, in all the countries under review unemployment was at its peak in 1933 and fell off enormously after the outbreak of war in 1939. The rough generalization that the "twin scourges" of mankind, war and unemployment, at least do not occur simultaneously has some validity. It also seems legitimate to note that countries with a large agricultural labour force (Canada, Denmark, Australia) suffered heavy unemployment as well as the countries, such as Great Britain, relying mainly on industry.

Great Britain.—The statistics for Great Britain are worth close attention not only because of the important role of that

country in world economy but also because the figures are unparalleled for the length of time covered and, until the late 1930s, for their scope and reliability.

The first table to examine is Table III, which gives trade-union data on percentage unemployed from 1881 to 1926. The proportion of the labour force covered by these figures changed considerably over this period and doubts have often been expressed about their reliability as a general indicator of unemployment. From the period (1920–26) during which the figures overlapped with the unemployment insurance statistics it does appear, however, that the trade-union statistics were a reasonably good guide. Some interesting features of the figures stand out, the most obvious being the low average level of unemployment before 1914 compared with the postwar period; *i.e.*, that for one reason or another, in Great Britain at any rate, unemployment was

a much less severe problem in the 19th century than in the inter-war period. But it is also clear that there were bad individual years (1886, 1893) and that therefore the dispersion of unemployment around the mean level was quite high. The virtual disappearance of unemployment in World War I is also clearly recorded.

Table IV shows the percentage unemployed among insured workpeople in Great Britain, 1921–48. There are a number of reasons why care must be taken in the interpretation of these figures, some connected with changes in the scope of the insurance scheme (*e.g.*, the late inclusion of agriculture, the extension to the 14- to 16-year-old group and the raising of the income limit from £250 to £420 in the late 1930s) and others connected with changes in the definition of unemployed, such as the treatment of men attending government training centres or the change in 1940 to the system whereby any two (instead of any three) days within a period of six consecutive days should be treated as a continuous period of unemployment. And it need not be reiterated that Great Britain's insurance statistics, in the treatment of marginal workers, are subject to many of the difficulties already listed. This, however, is not nearly so important when concerned, as here, with the percentage unemployed rather than the total volume. With these reservations in mind, the main conclusions to be drawn from Table IV are fairly obvious. Unemployment was very high at the beginning of the period because of depression and strikes; it gradually fell to about 10% in 1928–29, but rose to a new high level in 1932 and was, in fact, only wiped out by the outbreak of World War II. It should be noted that unemployment in the years after World War II was much less than in any other peacetime years of the period, even the early 1930s. The other main point to note is that the numbers temporarily stopped are a much higher proportion of the total unemployed, as one might expect, in 1926 (the year of the general strike) and 1947 (the fuel crisis).

Table V shows something about unemployment in different industries in the interwar period. It can easily be seen from this table that there was a large difference between the experience of the heavy industries such as coal mining, iron and steel and shipbuilding, on one hand, and the light industries (*e.g.*, papermaking, hosiery and bread and biscuits), on the other. There was also a contrast between the old industries, such as cotton textile, and the new, such as electrical apparatus.

United States.—As there was no national insurance scheme for unemployment in the U.S. before 1935, private estimates, such as those of the National Industrial Conference board and the American Federation of Labor, are the only available source of information before that date. As the main basis of these estimates was to extrapolate data on total labour force and numbers in employment from the decennial census figures and then take the difference as a measure of unemployment, no great degree of accuracy can be claimed for the result, if only because any given absolute error in one of these two basic magnitudes implies a much greater percentage error in the residual, by virtue of the small size of this figure compared with the others. Nor did the establishment of a social insurance scheme in 1935 automatically provide good data on unemployment, as in so many other countries. Simply because of the great size and variety of conditions in the U.S., the system had to allow for local modifications at the state level. Therefore, meaningful aggregate data for the entire nation are not easily obtained from this source. After 1940, the position improved as monthly data were collected on a sample basis on employment, unemployment and the labour force. This method seems to provide very satisfactory estimates and therefore after that date U.S. data can be taken as extremely reliable.

Table VI shows percentage unemployment, based on different estimates, for the years 1930–48. Although the discrepancies between estimates 1 and 2 over the years where they appear jointly seem very large, it should be noticed that the year-to-year movements are much more comparable and therefore, even though doubts may be attached to the absolute volume of unemployment during this period, the relative changes from one year to another seem reasonably clear. The main differences which emerge in any comparison with the British figures (Table IV) are the relative lightness of unemployment in the U.S. in the 1920s, a time when many British staple industries were severely depressed, and the persistence of heavy unemployment in the later 1930s up to and beyond the outbreak of World War II in Europe

Some partial statistics on unemployment by industry are shown in Table VII. As in Great Britain, there was a wide difference in the incidence of unemployment; whereas in 1932 percentage unemployment in all industries was 22, it was 42 in metals and 64 in building on the one hand and only 19 in printing on the other. It must be emphasized, however, that these figures are based on labour-union data and are therefore subject to the general limitations of such sources.

Finally, the relative extent of unemployment in different regions in 1940 and 1947 is brought out in Table VIII. It is interesting to note that unemployment in the southern, or less industrialized areas of the U.S., was apparently less than in the other parts of

CAUSES OF UNEMPLOYMENT

To understand the causes of unemployment it is necessary to make a clear distinction between the different types and forms. Although it may be impossible to place any individual worker in any one category, the main distinction which economists usually make between general (or mass) and particular (or frictional) unemployment is indispensable for analysis. The first heading covers both the type of unemployment that occurs over the course of the trade cycle, such as that which struck the world in the early 1930s, and also the long-term trend toward increased unemployment that some authorities predicted for such mature economies as the U.S. It is essential to include both concepts under this heading, for obviously the stagnation type of unemployment might persist even if means of levelling out the fluctuations of the trade cycle were devised and, conversely, cyclical unemployment has certainly been found in the past in economies far from mature in the usual sense of the word, as a glance at the trade-union statistics for Great Britain in the 19th century (Table III) will show. Particular unemployment embraces such main categories as casual or intermittent work and seasonal work on the one hand, and what is usually called structural unemployment on the other. These sorts of unemployment will clearly persist however successful is the attempt to eliminate mass unemployment.

But it will be convenient to delay detailed examination of the causes of these categories until we have completed examination of the first type.

General Unemployment.—In the early 1930s, when unemployment had grown to formidable proportions, in the more advanced countries of the world it was the lot of about 20% of the labour force, and in some individual countries the figure was nearer 30% (Table II). This was by far the worst period in history for unemployment; for not only did it reach unprecedented heights but in many countries it lasted for a long time, being wiped out to any considerable extent only by the onset of World War II. It was this feature of long duration of unemployment which gave rise to the speculation about chronic unemployment being a permanent feature of advanced economies. For, whereas in the 19th century there had been bad individual years (*e.g.*, 1886, 1893; *see* Table III), the tide had usually subsided fairly quickly. But the strong evidence about the existence of mass unemployment in the 1930s should not allow us to forget the coexistence of particular unemployment. Although the theory of general unemployment will indicate why the average level of unemployment was 19.9% in Great Britain in 1933, it will not indicate why it was as high as 59.3% in shipbuilding but only 9.2% in the paper trades, why it was 34.6% in Wales but about 11% in London and the southeast. Nor does the theory of general unemployment have anything to say about the marked seasonal fluctuations which have always characterized unemployment.

Thus, to summarize the statistical evidence, there are good grounds for believing that unemployment is not one problem but many. And therefore it may be well to split up the theoretical analysis as suggested.

Examination of statistics has shown the tremendous problems created, or liable to be created, for western economies by general unemployment. From the beginning of the 20th century there was an increasing amount of attention paid to this phenomenon by economists, and, in fact, this topic in some cases replaced the traditional teaching of the theory of value as the keystone of economic thought. This general tendency received a tremendous impetus in the 1930s, being particularly associated with the publication in 1936 of Lord Keynes's *The General Theory of Employment, Interest and Money*, in many ways the most important book on economics since Adam Smith's *Inquiry into the Nature and Causes of the Wealth of Nations* was published in 1776. This work for the first time provided the basis for a satisfactory theoretical account of general unemployment. Until that date, it has sometimes been said, there were as many theories as there were economists.

Although not without a good deal of heated discussion and some modification of the more controversial arguments put forward by Lord Keynes, many economists accepted his central hypotheses and methods of argument.

The following sections elaborate some of the more important propositions in the theory as they were advanced by Lord Keynes.

National Income and National Output.—Although these notions are complicated in their details, the general concept behind them is fairly straightforward. If the economic life of any country is examined (and to sharpen the issue it can be regarded for the moment as self-contained, having no trading with other countries), it is fairly easy to see that over the course of any given period of time, say a year, there will be a certain amount of work done, resulting in the production of a number of different commodities—so many tons of coal mined, so many units of electricity generated, so many ton-miles of goods conveyed, etc. From this can be derived the concept of a national output over the year consisting, broadly, of the totality of work done by all the individual members of the community. Thus, over any given period of time it is possible to aggregate the amount of work done or services performed (there is no difference in principle between the man who makes butter and the man who sells butter—each is making a contribution to the general economic life of the community) into a meaningful total. Now, of course, there are a number of difficulties in the actual computation of this total. The most obvious is that there is no means of adding all the physically dissimilar products which form part of the complex pattern of modern life except in terms of money value. That is, to reach the total national output, it is necessary to add the value of steel bars, fountain pens, furniture, etc., produced over the course of the year.

This carries two immediate complications: the first is that the national output must be limited to those items which in fact can easily be measured in money terms and therefore, for instance, housewives' services must be excluded; and the second is that if a comparison is made between the national output in two different years it must be noted that any change may be the result either of a change in the physical volume of output or of a change in the value of money, the standard used for measuring this output, or, as is almost always the case, a mixture of the two. Another important problem arising in the calculation of national output must also be mentioned. It has been said above that the national output must be thought of as the aggregate of a number of tons of coal, units of electricity, etc. But, in fact, the value of electricity generated will include as an item of cost the value of any coal used in the process. Therefore, to add all the coal produced and all the electricity generated would obviously be duplication. Consequently, statisticians and economists adopt various conventions such as taking the "value added" by one industry to the materials it takes over from other industries (rather than the gross value of output) in attempts to eliminate this sort of duplication.

This gives some idea of the meaning of national output (or national product, as it is sometimes called). What is its relation-

ship to national income and national expenditure? On the basis of the definitions used here, these are really three different ways of looking at the same magnitude and, therefore, provided the correct definitions are chosen, must add up to exactly the same sum. This can be seen most easily by thinking of an independent producer such as a small shopkeeper or plumber who works on his own. His output is the value of his goods sold or services performed, less the cost of such things as materials bought from other tradespeople and used up in the course of his activity. Now clearly his income must be exactly the same size; for what is available for spending must inevitably be his receipts less necessary business expenses. And equally clearly his expenditure, if defined in the broadest sense to include purchases of securities and increases in bank deposits, etc., as well as acquisition of goods and enjoyment of services, must come to exactly the same total. Now it can be seen that the identity, output = income = expenditure, holds good in the case of independent producers. In fact, it holds good for all types of producers, and so long as nonproducers such as housewives and children are regarded as simply spending agencies for the producers in a household, it holds good for the community as a whole and therefore, according to Keynes, national output = national income = national expenditure.

Another point to make is that this identity holds good for an "open" economy having trading relations with other countries as well as the "closed" economy so far considered. This is clear when the value of imports exactly equals the value of exports and, in the case where these values differ, application of the same broad notion of expenditure will preserve the identity.

The exact relation of this topic of national output and national income to the main problem of unemployment must now be considered. It is evident that the size of the national output must be closely related to the level of employment, at any rate over a short period of time where technical innovations, etc., are unlikely to alter the productivity of labour materially. Therefore, if the forces controlling the level of national output can be discovered, this will in effect be a discussion of the causes of general unemployment. If it is remembered that a fall in national output is more or less equivalent to an increase in unemployment, no difficulty will arise. "More or less" must be noticed, however; for a fall in national output may take the form of a fall in prices rather than in physical output and therefore bear no very direct relation to the level of employment. But this complication can be ignored for the time being, while the central problems involved are discussed, and will be returned to later.

Keynes points out that the national income (alias output) can be dissected into the two subtotals which are the relevant tools for the analysis of employment and income fluctuations—investment (or saving) and consumption. Of the stream of goods and services produced each year, some pass more or less directly into final consumption, whereas others are primarily designed to last for some time and help in the production of other goods for final consumption. Whereas clothing, food, fuel, etc., fall in the first category (*i.e.*, consumption goods), plant and machinery, buildings (industrial and private) fall in the second (*i.e.*, investment goods). Therefore, total income or output can be entirely resolved into consumption and investment. (Any difference between the value of consumption goods coming onto the market and being taken off the market—that is, any accumulation or diminution of stocks over the period—is put in the latter category, for these goods are not contributing to present but to future consumption in just the same way as machinery and houses.) If, on the other hand, this matter is looked at in another way it can be seen that incomes received must be spent or saved; nothing else is possible, if saving is defined in the broadest sense, to cover all such items as adding to cash holdings as well as buying government securities or depositing sums in the post office savings bank, for in this case saving is essentially being defined as "not spending." Therefore, if income on the one hand equals investment plus consumption and on the other equals saving plus consumption, it must follow that investment equals saving. There is nothing very remarkable about this equality and, in fact, it follows directly from the definitions chosen. Nevertheless, it caused some difficulty and one or two apparent objections must be cleared up. One lies in the particular sense in which "investment" is used; it is not the same as the everyday usage of the word which implies the purchase of intangible claims or securities as well as the acquisition of physical assets such as houses. Here the word is used to denote purchases of the latter type exclusively. Therefore, the outlay of a businessman in building a new factory is investment; the sum paid by the public to acquire shares in his firm is not. Another point is that the savings-investment identity does not imply equality between investment and the total of positive saving. For over the course of each year some individuals spend less than their total income on consumption goods and services and hence save, but others spend more than their income and therefore dissave. The magnitude required is the net figure derived by subtracting the second item from the first. Still another point is that both income and investment may be taken either as gross or net of that amount of investment needed to maintain the existing stock of capital equipment intact. Although the savings-investment identity holds in either case (the difference between net and gross simply consists of making an equal addition to both magnitudes), it is simpler and more relevant to take the net concepts. Therefore, this connotation must be understood in all subsequent references to income, investment and saving, unless otherwise indicated.

Now a new problem arises. It is clear that the amount of investment which actually takes place in any one year is equal to the amount of saving taking place, but it is also equally clear that, by and large, the people who save are not the people who invest. What are the motives which inspire investment and savings and how does equality come about? These questions and their answers will be seen to be at the core of the theory of employment.

Let investment be considered first, with those sections of the community principally concerned, together with the motives that guide their decisions. Obviously most attention must be paid here to businessmen for, although governments that build battleships and roads, individuals that build houses and traders that add to their stocks are all said to invest, by far the largest role is played by businessmen in their decisions to add to their machinery and plant, their buildings and stocks of materials, semifinished goods, etc. Now the essential question the businessman must ask is whether his new building will yield sufficient profits to make the enterprise worth while. This in turn depends on two factors: (1) the expected series of returns (after deduction of operating costs) likely to accrue over the life of the machine, and (2) the rate of interest payable on the sum borrowed (or, alternatively, if capital is available without borrowing, what rate of interest could be obtained if this capital were lent to other firms or enterprises). For the decision to invest must depend on the comparison between the expected series of returns, suitably adjusted for the fact that these returns lie in the future and for any special risks involved, with the current rate of interest payable on the sum borrowed or raised in the form of share capital. The expected series of returns depends on a whole host of miscellaneous factors which are best summarized in the portmanteau phrase "business confidence," taking into account all such factors as the expected state of trade, the possibility of changes in taste on the part of the consuming public, the potential threat of new supplies or new inventions, etc. The rate of interest is largely under the control of the banking authorities. The relative importance of these two factors depends very considerably on the expected length of life of the investment planned; the longer the life the greater the allowance for futurity of returns and hence the more important the rate of interest and the less important such factors as the rate of amortization of capital. This is a complicated subject, but essentially the point is that, if equipment is expected to last only a short period of time or if the risks attached to investment are very great, a small fall in the rate of interest will have little effect on the level of investment. If, on the other hand, the building of long-lived capital equipment such as houses is a major fraction of investment, then a reduction in interest rates can be expected to give a considerable impetus. So much for the forces motivating investment.

For saving purposes some economists divide the community

into the three different categories of government, business and personal. Government saving obviously depends largely on general policy of taxation and expenditure and therefore may be roughly taken as an autonomous factor. At the same time it should be noted that there is an automatic tendency for tax receipts to rise (assuming unchanged tax rates) and expenditure, such as that on unemployment benefit, to fall in a time of boom and for the reverse to happen in a slump. Therefore, the amount of government saving does partly depend on national income. Business saving consists of two parts, the sums put aside to cover depreciation of plant and machinery and those put to general reserve; but as we are dealing only with net saving here we shall not err very far in neglecting the former. Additions to general reserves clearly depend to some extent on the level of income, although they are also influenced by such factors as the desire for a margin of security or the possibility of needing finance for future expansion. It seems fairly safe to say, however, that the ruling rate of interest does not influence them very much. Now comes the third category—personal savings. In normal times this is important (it was nearly half the total savings in Great Britain in 1938) and although its importance was reduced in post-World War II years, it was expected to increase again when more normal times returned. Much the most important factor here is the level of income, for as a man's income increases it is almost inevitable that there will be a gap between receipts and spending. Whereas the very poor spend every penny, the millionaire will find it difficult not to save a large proportion of his income. It must be noted that this income factor has a dual importance; for saving may increase, either because the income of everyone rises in some similar manner (say, in equal proportions) or because, although there is no rise in national income, there is a redistribution of income from the poorer to the richer classes. Therefore, saving can be said to depend on both the level and the distribution of income. It has been frequently maintained in the past that personal saving is also closely dependent on the rate of interest—that it is the stimulus of the return to be secured from buying securities or making bank deposits that impels people to save. But obviously this is debatable if only because those who save to secure a certain income in their old age will need to accumulate a smaller capital sum if the yield on it is to be larger. Therefore, many economists became inclined to be rather sceptical about the influence of the rate of interest on savings and disregard it as a factor of particular importance. Finally, even if the over-all income level, the distribution of income and the rate of interest remain unchanged, the amount of saving may still tend to alter if people's general attitude to thrift and the ownership of property change. This, however, is likely to be the case only over a fairly long period of time and need not affect the consideration of short-period problems.

To summarize this part of the Keynes argument: businessmen are principally responsible for investment and their decisions depend on expected profits and on the rate of interest; government savings are largely an act of policy while business and personal savings mainly depend on the level of income and its distribution, with a further very secondary relation to the rate of interest. The question that must now be answered is simply this: how are these plans reconciled with one another? Keynes had shown that recorded or realized investment and saving must be equal to one another; but if investment and savings plans are made by different sets of people inspired by varying motives, what is the mechanism which transforms planned inequality into realized equality? This is the central problem of employment theory and it is on this point that *The General Theory of Employment, Interest and Money* broke away completely from previous tradition. For until then it had always been argued, though with varying degrees of confidence and persuasion, that the equilibrating factor between investment and savings plans was the rate of interest. That is, it was argued that if investment tended to outrun saving the rate of interest would rise to such a level that investment would be curtailed and saving expanded to bring the two into equality; and if saving tended to outrun investment the rate of interest would fall. But, as has been seen, there is good reason for doubting the importance of the influence of the rate of interest on either investment or saving; in both cases it is often a minor factor. The solution which Keynes suggested was that the investment and saving plans were brought into equality by changes in the level of income; that if investment planned exceeded saving then the level of income would tend to rise and that if saving planned exceeded investment it would tend to fall—in each case preserving the equality of realized investment and saving. This concept of income shifting from one level to another in response to people's divergent plans for investment and saving is really fundamental to the whole structure of this way of thought. But although the fundamental idea is relatively simple to grasp, the details of the operation of the mechanism are by no means straightforward and must be examined at some length.

Let it first be asked, what happens if an investment, say the building of a new factory costing $5,000,000, is made. What will be the effect on the level of income? In general terms, according to Keynes, income will have to rise to a level sufficiently high to secure additional savings of $5,000,000 Specifically, the process of events will be something of this sort. The investment adds $5,000,000 to the flow of spendable income without any corresponding increase in the supply of consumption goods. Now suppose that people are prepared to save half of this incremental income but want to spend the rest. The first reaction will clearly be a reduction of dealers' stocks or, in other words, a sort of negative investment, albeit involuntary, partially offsetting the initial positive investment. This, however, will be only a temporary effect and will disappear as soon as dealers have had time to replace their stocks. Therefore, it may be said that there is an initial increment of income of $5,000,000; the recipients spend half of this and save half; the recipients of the $2,500,000 again spend and save half and so on. The increment in income resulting from the increment in investment will be $5,000,000 plus $2,500,000 plus $1,250,000 plus . . and the total sum can in fact be shown to be $10,000,000. Additional saving, on the other hand, will be $2,500,000 plus $1,250,000 plus $625,000 plus . . ., a total of $5,000,000, exactly sufficient to offset the incremental investment. This general process by which an increment in investment leads to a multiple increment in income is known as the multiplier effect, the multiplier being the ratio of the increment of income to the increment of investment; *i.e.*, in our example, 2. The value of the multiplier is a way of indicating how much of additional incomes are saved. It was assumed that one-half of additional incomes would be saved and hence the multiplier is two, the reciprocal of this fraction; if we had postulated saving of one-third of additional incomes, the multiplier would have been three. Therefore, we may say that the multiplier tells us precisely how much the level of income will have to change in order to bring the investment and savings plans of the population into harmony with one another. And, of course, it applies equally well in the case of a downward movement in planned investment in relation to saving.

It follows, therefore, that anyone who decides to invest more (less) will generate a degree of rise (fall) in income, depending on the willingness of the community to save out of additional income. But what happens if someone decides to save more of his current income? Is the process a parallel one or not?

The process of events is in fact something like this. If the community suddenly decides to save a larger proportion of its income the immediate reaction will be a piling up of unsold goods in shops, warehouses, etc. That is, dealers perform investment to offset the increment in saving. But this action is involuntary and obviously will soon lead to a reduction of orders from manufacturers. Thus, the increased desire to save will be transmuted into a reduced demand for current output and the level of output will tend to fall. It will continue to fall until people no longer wish to save more than the community is currently willing to invest.

Further Details of Employment Theory.—Keynes showed that, on one hand, saving and (to a lesser extent) investment depend on income; and, on the other, the level of income depends on people's relative willingness to save and invest. At first sight

it might seem that this is circular reasoning of the type that *A* depends on *B* which depends on *A*. But this would be mistaken. The point is that income affects the amount of saving and investment, whereas it is affected by the relative willingness to save and invest Thus, if at any given income level people decide to invest more, there is a rise in output and income; this in turn provides expectations of increased profits and hence is a further inducement to invest. But the increment in income provides an even greater incentive to save and therefore a stable position of income is reached, the desire to invest exactly offsetting the desire to save. If, on the other hand, the desire to save out of a given income increases there will be a fall in income; this will cut down the inducement to invest but nevertheless the reduction in income and output will not be indefinite, for the amount people desire to save will fall off *even* more quickly as the community's standard of living falls and therefore a stable lower position will in fact be reached. Therefore, a whole series of stable positions of output and employment must be conceived, ranging between full employment on the one hand and deep slump on the other (as will be seen below, it is possible in some circumstances for an economy to go "over the top," beyond the position of full employment, but this may be neglected for the time being), at any of which positions the willingness to save and invest may be brought into equilibrium with one another. A further point must also be noticed. Although an increased (decreased) desire to invest will almost always result in an actual raising (lowering) of the level of investment, an increased (decreased) desire to save will not in general lead to an increment (decrement) of saving. For in both cases the necessary equality between investment and saving is preserved by *income movements* which affect the amount saved. Therefore, although investment and saving must always be equal, they are not equal partners In the whole process.

If the desire to save at any given income level were reduced by some means, there would tend to be a rise in income and employment. It is therefore sometimes thought that the main need is to reduce the desire to save. In most cases this is quite true. For a reduction in the desire to save may not only lead to a higher level of output and employment but also to a higher level of investment (and saving) than is currently taking place and hence an accumulation of capital equipment which will ensure higher output and higher income per head in future years. But, at the same time, in the sort of position which prevails in the immediate aftermath of war there is usually a large unsatisfied demand for consumers' goods and hence a reduced desire to save does not lead *to* an increase *in employment* but simply substitutes consumption for investment. Or, in other words, the desire to save can only be considered as the villain of the piece in positions of less than full employment.

To put it very simply, the whole problem posed by Keynes could be stated in this way: investment and saving must always be equal to one another, and therefore any change in the desire to save or invest at a given income level will generate such a change in income as to bring these desires into harmony again. But some more elements still have to be fitted into the jigsaw to make the design complete. The most important is the problem of the rate of interest. For, if the older notion that the rate of interest is the equilibrating factor between people's willingness to invest and save is rejected, what explanation can be put in its place? Here again Keynes put forward revolutionary notions in his book, but it may be as well first to clear up a common misapprehension which is closely involved with this problem of interest determination.

It had often been thought that an addition to the quantity of cash, bank notes and bank deposits would in some way of its own accord influence the level of income and employment. But no one ever quite explained why it should do so and, in fact, more reflection shows that it does not, for it is the spending of money rather than its creation which inflates the level of demand for consumption or investment goods and hence the level of output. This distinction is vitally important and in order to illustrate it more clearly it is necessary to consider the most typical forms in which money is created. The most common way is by the process of open-market operations which, briefly, increases the reserves of cash or central bank credit held by the commercial banks and thus enables them to increase their deposits. This can be done either by the purchase of government bonds or by advances to businessmen. If the former is considered first, the most likely result is that the price of government bonds will tend to rise and the public will then be induced to sell bonds to the banks, the final effect thus being for the public to hold more money (in the shape of bank deposits) and the banks to hold more securities. The statement that the price of bonds will rise is, of course, equivalent to saying that the rate of interest will fall, for if the price of a 3% bond rises from $100 to $150 this means a reduction in yield from 3% to 2%. What determines the extent of price rise will be examined shortly. But it must first be noted that, if the fall in the rate of interest has no consequences, then the story is complete—*the only* effect of this creation of credit is to alter the relative amounts of money and securities held by the public and the banks. At first sight, additions to bank advances seem to fall in a different category for it appears that these flow straight into the expenditure stream as businessmen use them to purchase materials, hire labour, etc. This is an illusion. For it is not the creation of the advances but the spending of them which is responsible for the increment in expenditure and if businessmen chose not to spend these extra deposits there would, in fact, be no effects on total demand Similar considerations to these apply to the creation of money by other means and therefore the general principle can be laid down that additions to the stock of money do not, of themselves, add to the flow of money expenditure.

To return to the rate of interest: What determines the willingness of the public to switch from bonds to money as interest rates fall? Keynes's answer to this lies in another question: For what purposes does the public hold money? It is essential here to distinguish between the two functions of money as a medium of exchange and as a store of value. The public needs money to conduct the everyday business of life but the amount it needs for this purpose is a fairly constant fraction of the transactions in process; *i.e.*, of the level of national income. In addition, it needs money as a form in which to hold wealth. There are various forms in which wealth may be held—real property and securities, for instance, as well as money—and all these have varying advantages. The essential point is that the rate of interest ruling at any one time is the force which determines the proportions in which wealth is held in these forms. For, whereas bonds, for example, will give an annual yield but have some risks of depreciation, money has no annual yield but no risk of depreciation (in terms of money). Therefore, the public is always tending to distribute its assets between these different forms in order to attain some optimum compromise between yield and liquidity. If the rate of interest tends to fall, the relative attraction of money increases compared with that of bonds and a larger proportion of assets will be held in the former category. If, on the slightest sign of a fall in interest rates, there is a wild rush to sell securities for money, then in fact the fall in interest rates will be small. Therefore, we can now answer the question: How far will interest rates fall if new money is created? If the level of income remains unchanged people's demand for cash for transaction purposes will also remain unchanged; therefore, the rate of interest must fall to that point where people are willing to hold more cash and fewer securities in the light of the relative advantages of each type of asset.

But this leads to another point: Is there any justification for assuming the level of income unchanged and hence the demand for money for transaction purposes? This in turn extends to other ramifications of the theory of employment. The first is that, although the additional stocks of money have no direct influence on income and output, they are liable to cause a fall in interest rates and this, as was seen before, will have some effect on the willingness to invest, even if none on the desire to save, and hence there will tend to be a rise in the level of income and output. The second is that the demand for money for transaction purposes is closely related to the level of income. Therefore, if for any reason this rises there will tend to be an increased demand. If the total

supply of money is fixed, the only way of attracting money into active circulation is to persuade people holding capital assets in this form to part with it, and this will be done only if interest rates rise sufficiently to make them want to switch from money to securities. Therefore, it must be emphasized that an increase in the rate of investment *contains within itself the seeds of destruction* if the total stock of money is fixed; and conversely with a decrease.

This completes the main outline of Keynes's theory of employment—a complex pattern of interweaving strands. It may perhaps be summarized once more as follows: the principal factors are the willingness of people to invest, which in turn depends on the expected rate of profits and the rate of interest, and to save, which largely depends on the level of income; any divergence between willingness to invest and save at any given income level will tend to disappear through movements of income upward or downward from that level.

To conclude this discussion of the theory of income and employment advanced by Lord Keynes, some more complications must be briefly mentioned. So far movements in income have been described as if they automatically meant parallel movements in employment. But obviously this is likely to be true only within fairly narrow ranges; all people know from personal experience that prices tend to fall in slumps and rise in booms and hence movements in income are more than proportionate to movements in employment. Apart, however, from possible effects on the demand for money for transaction purposes, and hence interest rates, the only important modifications that become necessary in the central theory concern those extremities where price rises outstrip wage rises. Over a large range of income levels over-all wage rates and prices may be expected to move proportionately, though this, of course, does not imply similar changes in all individual prices and wage rates. But when there is a position of overfull employment, prices tend to rise faster than wage rates, hence profits rise rapidly and, as this may be expected to lead to some redistribution of incomes, the relationship of saving to income tends to alter. Another complication is due to the existence of government financial operations but the essence of this can be summarized by saying that if a government has a surplus of expenditure over receipts this is equivalent to additions to the income expenditure stream resulting from an increased level of investment, for in both cases there is an addition to the level of expenditure and no addition to the value of output of goods available to meet that expenditure. Yet another complication comes from foreign trade, but again the treatment is, in principle, straightforward. For if any country has a surplus of the value of exports over imports then this is exactly equivalent to an increment in the budget deficit or the level of internal investment, for it implies that exporters are receiving larger incomes than the value of goods being paid for by importers. Hence it can be treated in a precisely analogous way to the other factors.

Particular Unemployment.—The causes of general unemployment having been dealt with, it is necessary to examine the causes of those other various types of unemployment called particular or frictional. Here the works of William Henry (later Lord) Beveridge may be referred to, for it was his *Unemployment: A Problem of Industry* (1909) which first suggested the lines of analysis. If casual unemployment is taken first of all, it is fairly easy to see that there are some obvious causes. On the one hand, a good deal of work is intermittent in character and hence there are wide fluctuations in demand for labour. The classic example of this kind is dock work, where traditionally a reserve of labour was kept to meet peak demands for loading and unloading, the typical method of engagement being by the hour or day only. But all such temporary unemployment as that resulting from fires, floods, industrial disputes, etc., must also be placed under this heading. It must also be remembered that there is always a certain amount of marginal labour which for one reason or another—mental or physical incapacity or simply unwillingness to work regularly—may be absorbed into employment only in boom periods, such as wartime, when it is impossible to obtain all the labour required from normal sources. This point is of particular importance when standard rates of wages, irrespective of efficiency, have to be paid to all workers. Because these people are occasionally employed they must be regarded as part of the labour force seeking employment, but it is obviously their intermittent suitability for employment, rather than the intermittent character of demand in any one industry, which is the reason for unemployment of this sort. Therefore, both these kinds of factor contribute to the existence of a more or less permanent reserve of labour.

The second type of particular unemployment is seasonal. The meaning of this is obvious—that the conditions of demand (*e.g.*, Christmas postal services) or production (*e.g.*, potato harvesting) may make for alternate slack and busy periods in any one year. But the causes are perhaps a little less evident. For although it is clear that workers in seaside resorts are only likely to be needed in summer and that the demand for sausages is stronger in winter, it is equally clear that no seasonal unemployment would exist if proprietors of "board-residence" houses became workers in sausage factories in winter, and vice versa. The reason this does not happen so neatly is to be found partly in the fact that the numbers out of work and seeking employment in summer may not be exactly the same as those in winter and partly in that the process of moving from one job to another is not so simple as it may sound. It is unlikely that the sausage factories will all be found in or near the seaside resorts and it is not necessarily true that the ability to polish shoes or make beds in a seaside lodging house is evidence of good qualifications for packing sausages into cartons.

Structural Unemployment.—This problem is both more difficult to understand and of more gravity than those just discussed. The principal feature distinguishing structural from other types of unemployment is that it is associated with permanent changes in the working of the economy. These changes may be in tastes or in techniques or in relative importance of different localities. As an example of the first, the long-term tendency for Great Britain's consumption per head of alcoholic beverages to fall and that of tobacco to rise may be given, in the second case there are such phenomena as the replacement of cotton fabrics by synthetic fibres, or coal-fired locomotives by diesels; and in the third case there is the U.S. example of the competition of the cotton textile industry in the south with that in New England. Now it is of course true, as in so many economic problems, that in any particular case more than one of these causes are at work (*e.g.*, so many changes in tastes are the result of, or at least closely associated with, changes in techniques), but it is essential to keep these separate points clear in any analysis. These sources of unemployment were of major importance in the period between World Wars I and II. The reasons were to be found largely in the dislocation of the structure of world trade brought about by World War I (*e.g.*, the rise of new textile industries) and the increased rate of technical innovations. Some authorities would also argue that the very act of trying to raise standards of living must of itself magnify problems of this nature, because tastes are likely to be more fickle and pliable where living standards are high (and hence many goods inessential and liable to sudden fluctuations in demand) than where standards are low but stable. But whether such contentions be reasonable or not, the essential fact is that, as with other types of particular unemployment, it is necessary to explain not only why or how often a man loses his job but also why he does not get another immediately. The case of getting other jobs obviously depends partly on the level of general unemployment but it also depends on the mechanism for informing workers of other opportunities and for persuading them to seek out these other opportunities, as will be brought out in the following discussion of remedies for unemployment.

In conclusion of this analysis of the main causes of unemployment, both general and particular, it must be repeated that at any one time all these forces are likely to be at work and inextricably intermingled. It will never be possible to point to an individual and say "he is a product of general unemployment," or, "if there were no structural changes he would not be employed." But despite this fact, the separate analysis of the various causes of

unemployment is vital, as the discussion of remedies will make clear.

REMEDIES FOR UNEMPLOYMENT

Just as the causes of unemployment have been dealt with under two separate headings, general and particular (not including structural) so, too, the remedies can be treated in this way.

General Unemployment.—*It is important to note that some* commonly proposed remedies can be rejected immediately as unsuitable, on the basis of the foregoing theoretical analysis. The most important of these is the frequent assertion that it is only necessary to lower the wage rates of workers in order to secure greater employment. At first sight this sounds very plausible, for if the individual storekeeper wants to sell more of his wares he may often succeed by lowering his prices. But this analogy does not necessarily hold; for the vital point is that workers as a whole are not only the nation's producers but also the nation's consumers and if their wage rates are lowered their buying power is also reduced. Therefore, any general reduction in wage rates will, apart from possible reactions on the demand for money for transaction purposes and hence interest rates, be largely self-defeating.

Other suggested remedies are to be found in proposals for reducing the supply of labour by emigration, by raising the school-leaving age or lowering the retirement age, by restricting the number of female workers or by sharing the work by putting everyone on a part-time basis. There are various fine points connected with each of these proposals which need not be explored here, but the fundamental objection is common to all: none of them does anything to raise the level of income per head of the population. If the labour force is reduced by emigration, at the same time the number of consumers is also reduced, and it is therefore probable that the percentage of unemployment will remain unchanged. Similarly, if the work is shared by short-time employment, again nothing is done to increase the level of income and the level of demand in relation to the value of output.

Another suggested remedy is the combine or monopoly argument. If any one firm is able to get into a monopolistic position in an industry it can often increase its profits (compared with the freely competitive situation) by cutting output and raising prices. Therefore, it is sometimes argued, when profits fall in a trade recession it is necessary only to cut output to remedy the situation. The fallacy in extending the argument from one firm to all needs no elaboration.

The fundamental requirement of any remedy for general unemployment is that it must raise the level of aggregate demand in relation to the supply of goods currently coming onto the market, or, to put the same point in different language, it must raise the level of planned investment in relation to planned saving. Such a process must add more to the flow of potential expenditure than it takes away and therefore must lead to an expansion of the level of income and employment. But the attack on the propensity to invest and the propensity to save can take several forms. In the first place, an attempt can be made to boost investment by the business sector—or private investment as it is usually called. Secondly, a government deficit might be regarded as analogous to private investment in its income-creating potential. Therefore, an attempt can be made to expand public "investment." It must be noted here that public "investment" in this sense does not mean only the construction of battleships, electric power stations, roads and so on, but simply the excess of any type of expenditure over receipts from taxes, fees, etc. In other words, "investment" may expand because of increased expenditure on the traditional functions of law and order, education, etc., or because of a reduction in revenue, as well as because of the purchase of capital goods. Over-all planned investment may also be expanded by increasing the gap between exports and imports (or, more accurately, between visible and invisible exports and visible and invisible imports). The other possible means is to attack the propensity to save and this may take a dual form, dealing both with the allocations to reserve of business enterprise and with the savings of private individuals. To put the matter in another way, steps can be taken to reduce the propensity to save and increase the propensity to consume.

Which of these particular lines of attack or which combination of them should in practice be followed depends on the particular circumstances of the country concerned. There are really two points to consider here: first, what are the relative magnitudes of the different components of investment or saving; and second, which of these components is most liable to sudden vicissitudes or which has any marked downward trend over the years. Thus, in the U.S., the ratio of the level of imports or exports to the level of over-all income and the ratio of the difference between imports and exports to the level of over-all investment are normally so small that these factors do not feature high in the remedial measures for unemployment. On the other hand, the possibility of being dragged into depression by a sudden decline in exports is always a very real one for a country like Great Britain and, therefore, measures for combating unemployment resulting from this factor must merit close attention. But as a rough generalization it is probably not far from the truth to say that the real problem in most countries organized on a capitalist or semi-capitalist basis is private investment, both because of its size relative to the other components of investment and because of its tendency to sudden unpredictable fluctuations. Therefore, nearly all plans for full employment pay detailed attention to this aspect of the problem.

What sort of measures can be taken to effect the necessary changes in planned investment and saving? From the latter half of the 1930s this subject received perhaps more attention from governments than any other economic topic. Broadly speaking, the proposals fall under the three main headings of fiscal policy, monetary weapons and direct controls, and they will be discussed in that order.

Fiscal Policy.—Essentially, fiscal policy is concerned with influencing the level of public "investment" or the level of private saving and only indirectly with the level of private investment or the excess of exports over imports. Several ways have been pointed out by economists in which these ends can be pursued. First, the government may do nothing in a time of trade depression. It may seem paradoxical to suggest this as a remedy for unemployment, but in fact this policy was not usually followed in the past and actions were often taken which had the effect of raising the level of unemployment, such as the attempt to balance the budget by raising tax rates in Great Britain in 1931. If the government does nothing to alter rates of taxes and rates of unemployment benefit, according to this view, it will automatically tend to have an excess of expenditure over revenue and hence help to mitigate the severity of the depression. This "automatic" budget deficit will come about for a number of reasons, the principal ones being the tendency for tax receipts to fall more than proportionately to the fall in the level of incomes (if operating on a progressive tax system), the reduction in insurance contributions, when more men become unemployed, and the greater likelihood of people defaulting on tax payments on the one hand, and the rise in the total of unemployment benefit paid out, or the amount needed to support farm prices (in the U.S.), on the other. This is called "*built-in flexibility*" in the U.S.

The second type of suggested fiscal policy is to increase expenditure without increasing revenue in time of depression, or "deficit spending," as it is usually called. This variation of expenditure could, in principle, assume many forms, but practical proposals relate to variations in government expenditure on capital equipment or on government purchases for stock. The idea of government public works in time of depression has a long history, going back to the early 19th century; but it was given its most forceful early expression by the Minority report of the Royal Commission on the Poor Laws and the Relief of Distress (1909), Sidney and Beatrice Webb being closely connected with it. Subsequently it was put forward a large number of times and featured in nearly all the British government-sponsored documents on employment policy appearing after 1935. It was, of course, one of the main features of the New Deal program in the U.S. and of the Swedish recovery program in the 1930s. The idea of government storage of raw materials and semi-finished goods in bad times and their

release in time of boom was also another frequently mentioned device. Its sponsors claimed an advantage over the public works idea in that it is more flexible—purchases can be directed to those items which are particularly in oversupply; but it also has quite apparent disadvantages, such as the heavy costs of storage and the risk of loss from premature obsolescence.

The next main group of fiscal measures has the basic motif of decreasing revenue but maintaining expenditure, or "deficit without spending," as economists call it. As in the case of deficit spending, this type of action could, in principle, take a large number of forms. In practice, one of the most common suggestions is the variation of social insurance contributions. The idea behind this is that social insurance funds should aim at a balance over a period of years only and, therefore, provided that in boom years contributors' payments exceed benefits paid out, it is perfectly legitimate for the reverse to take place in slump years. There is an automatic tendency for this to occur, but if a deliberate policy of varying rates of contributions is adopted the tendency can be transformed into a certainty. The chief difficulty about varying other rates of taxation is that it is usually not possible to do this—or at any rate reap the benefits of it—without considerable time lags, and, therefore, if action has to be taken quickly it may not be very useful. Exceptions are to be found, however, in such items as the British purchase tax, which can be altered without any formal parliamentary procedure.

The next group of suggested fiscal policies is "spending without a deficit," or the policy of maintaining a balanced budget but raising the level of both receipts and expenditure. This type of policy is aimed at reducing the private propensity to save rather than increasing the level of public "investment." The general idea behind it is quite simple—that any increment in taxation will, in general, tend to be paid by the upper-income groups; and, because the greater part of personal saving is performed by these classes, saving will tend to decrease more than proportionately with post-tax incomes. On the other hand, it is unlikely that the extra government expenditure will be distributed in the same proportions among the different income groups as the taxes and, in fact, it is highly probable that, if it takes the form of such social welfare payments as old-age pension or family allowance, it will be distributed almost exclusively to the lower-income groups. The net result of these government operations is that income is redistributed from the rich, who are likely to save a high proportion of their incomes, to the poor, who are likely to spend a high proportion. This is the main point behind spending without a deficit but it should be noted that this policy would also work in the right direction if the government were to buy goods and services with its extra receipts as distinct from making grants of various types to the lower-income groups. In that case, it would not be necessary to examine the distribution of the government payments among the different people responsible for the production of these goods. According to sponsors of this remedy, the very fact that the government essentially acts as a spending agency for the rich, who would otherwise save, is sufficient to start the ball rolling.

The last type of fiscal measure to be examined is that which aims neither at increasing public "investment" nor at raising the (balanced) level of expenditure and receipts. Instead, it is proposed to readjust the structure of taxation in any country in such a way that a larger proportion of revenue is derived from those taxes, such as income tax, which impinge most on the higher-income levels, and a smaller proportion from such taxes as excise duties or sales taxes which usually bear more heavily on the lower-income groups. By such a rearrangement of taxation it is hoped that the propensity to save will be sufficiently reduced to conquer unemployment.

Monetary Policy.—Here exposition can be briefer for belief in the potentialities of restrictive monetary policies was not so pronounced at mid-20th century as it was formerly. The main action which the banking authorities can take is to increase the supply of credit, or lower the rate of interest, or both. The effect of lower interest rates on the level of investment, however, seems to many economists to be problematic and unlikely to influence the level of saving appreciably. Therefore, according to them, it hardly seems probable that a downward movement of interest rates is likely of its own accord to cure a deep depression, even though there may be rather more reason for believing that a rise in interest rates can be more effective in halting a boom. And they point out that any change in the quantity of money as such has no other effects of great consequence; bank notes do not walk into shops and ask for goods and therefore any increment in the supply will not of itself avail much.

Direct Controls.—The principal types of direct-control measures suggested attempt to deal with the other two components of investment—private investment at home and the excess of exports over imports, or foreign balance, as it is usually called. It has often been suggested (*cf.* Sir William (later Lord) Beveridge, *Full Employment in a Free Society* [1944]) that a national investment board should be set up. In this particular context the idea was to influence capital works in both the private and public sectors of the economy, but the most essential point is that it is an attempt to soften the capricious nature of private investment. Many schemes were also proposed for control of exports and imports in time of depression. It is not possible to outline all these plans but it may be noted that they have been proposed at national and international levels. The national schemes comprise all such devices as tariffs, quotas and control of capital movements; the international schemes are incorporated in such bodies as the International Monetary fund to prevent malpractices in manipulating exchange rates, the International Bank for Reconstruction and Development (for encouragement of international loans) and the International Trade organization, which proposed many devices for liberating and stimulating world trade.

This is a brief summary of the various fiscal, monetary and direct measures for dealing with unemployment. Some of the principal snags involved in these policies may also be sketched. The first point is that the possibility of successful action depends on whether concern lies with the type of depression which has occurred at regular intervals since the 19th century or, in other words, the problem of cyclical unemployment; or whether policies are to be devised to deal with the stagnation type of unemployment. (It will be remembered that, in dealing with causes of unemployment, it was argued that both notions must be construed under general unemployment.) If fiscal policies are considered, obviously some such measure as the redistribution of income through public finance operations could conceivably be used as a remedy in either situation, but others, such as the balancing of social insurance funds over a period of years, are anticyclical weapons. Therefore, the means chosen must depend to some extent on the type of general unemployment that has to be dealt with in any particular country at any particular time. Nevertheless, some general difficulties in implementing policies to deal with either type can be indicated. The fundamental difficulty in dealing with cyclical unemployment is the timing of the remedial measures. So many policies—and this is one objection of some economists to "built-in flexibility," for instance—work fully only when heavy unemployment actually arrives; and it is precisely this state of affairs which they are supposed to prevent. In fact, it can actually be shown that if government measures are mistimed they may increase the fluctuations of employment over the trade cycle, rather than reduce them. With regard to stagnation unemployment, some economists point out that remedial measures may imply a recurrent government deficit or excess of expenditure over receipts. Over the trade cycle, others hold, this is unlikely as it is reasonable to expect that any deficit in the slump can and will be met by a surplus in the boom. But, if antiunemployment measures have to be taken over a long period of successive years this is impossible and it must follow that the national debt will increase all the time. Many authorities are loath to agree that it should occur and therefore imply definite limits to the possibilities of remedial action.

It may sound reasonable to move from this abstract plane of discussing difficulties of counterunemployment policies to some recital of the experience of different governments in applying such policies during the great depression of the 1930s. Unfortunately,

however, it is not easy to base any conclusions on these experiences, partly because relatively few governments pursued what is understood to be the right kind of policy and partly because those who *did often failed to do* it on a sufficiently large scale. Although a number of conclusions can be drawn from the U S. experience about the speed with which public works can be inaugurated, for instance, it must be remembered that even there, despite all the talk of deficit spending, "pump priming" and the like, private investment was reduced from $17,600,000 in 1929 to an annual average of $6,250,000 in 1931–38, whereas government expenditure on goods and services of all types rose only from $11,000,000 in 1929 to $11,700,000 in 1931–38 (average). Similarly, although the adoption of remedial measures in Sweden more or less coincided with a revival of activity and employment there, this tells very little about the possibility of such measures actually preventing the unemployment ever occurring in the first place.

Particular Unemployment.—Less discussion of remedies for particular unemployment is necessary, not because it can be regarded as unimportant, but partly because the best cure for particular unemployment is to cure general unemployment—for instance, the obstacles to movement from one area to another or the inducements to employers to hire men for short periods are much less if a state of general prosperity is prevailing—and partly because the remaining remedies for particular unemployment are more obvious and less subject to argument than those already discussed for general unemployment.

The main type of remedy for particular unemployment is to improve the mobility of labour, both between different jobs and different areas. The establishment of labour exchanges on a nation-wide basis, where all employers with vacancies and all employees seeking work may register, is an obvious step. But all such schemes as those for cutting down restrictive practices, training workers for new or skilled occupations, travel grants to help them move from one area to another will assist in this field. On the other hand, it is often suggested that jobs should be made mobile too, that some control should be exercised over the location of new industries taking the place of those declining through structural changes in the economy. Thus, in Great Britain, considerable powers were exercised after World War II over the location of new industries or new factories, and efforts were made to direct them to the old depressed areas such as south Wales, where it was feared that a local surplus of labour might reappear after the war.

Casual or Seasonal Unemployment.—A number of miscellaneous policies have been proposed or adopted to deal with this problem. A good deal of attention has been given to the reform of the methods of industrial engagement, discouraging or forbidding employers to maintain a permanent reserve of labour in their industry. A good "intelligence" system organized through labour exchanges, control over the location of new factories and even such devices as the placing of government orders in off season, or encouragement to manufacturers to make for stock at those times can help enormously in cutting down seasonal unemployment.

UNEMPLOYMENT INSURANCE. Prior to 1912 no country had a national system of compulsory insurance. The British National Insurance act of 1911 was the first to incorporate compulsory unemployment insurance into the institutional structure of a nation. After that time it became a part of the legal structure of most of the leading nations of the world. The decade of the 1930s witnessed significant new developments, particularly in Great Britain, Sweden and the United States.

Trade unions and friendly societies had granted assistance to unemployed members since the middle of the 19th century. A few towns and cantons in Switzerland established voluntary publicly subsidized funds from 1893 onward. In 1895 St. Gallen, Switzerland, attempted a compulsory system but the scheme ceased operation after two years. A more successful method was developed, known as the Ghent system, under which municipalities and other local authorities supplemented the benefits paid by trade unions and other associations of workingmen to their members. This system of co-operation between the local authorities and the trade unions was extensively used in Belgium, the Netherlands, the Scandinavian countries and France.

The British act of 1911 covered but a few industries and 2,250,000 workers. It was frankly experimental. The industries were construction, shipbuilding, mechanical engineering, iron founding, construction of vehicles and sawmilling. Very few women were covered. It was essentially an insurance plan under which the employers and workers each contributed 2½d. per week and the exchequer a sum equal to one-third of the total receipts from employers and employed. The rate of benefit was 7*s.* a week for adults, half-rates for persons between 17 and 18 years of age. A one-week waiting period was followed by a right to draw a week of benefits for every five contributions paid up to a maximum of 15 benefit weeks in one year. To obtain benefits a person had to show that he had worked in an insured trade in 26 weeks during the preceding five years, had applied at the employment office for work, had since been continuously unemployed, was capable of work and had not exhausted his right to benefit. He could be disqualified if idle voluntarily, through misconduct or because of a labour dispute. An insurance officer passed upon his application. His decisions could be appealed to a court of referees consisting of an employer, a workman and an impartial chairman; from them to an umpire appointed by the crown.

The act permitted an association of workers which paid allowances to the members to administer for those members the benefits payable under the act. This tended to encourage voluntary systems of unemployment assistance. So did another provision permitting the repayment to workers' associations, whether in insured trades or not, of one-sixth of their expenditures on account of out-of-work allowances to their members.

An employer who kept a workman continuously employed for a year and paid at least 4*s* contributions in respect to him might obtain a refund of one-third of his own share of the contributions. Workmen who attained the age of 60 and had paid 500 contributions were permitted a refund of their contributions, with compound interest, minus benefits they had received. Contributions first became payable in July 1912 and benefits became payable Jan. 1913. Obviously this was an inadequate period for the accumulation of reserves, but World War I prevented any strain on the insurance system during its early years. Administered at first by the board of trade, it was put under the ministry of labour in 1917. A national system of employment exchanges was set up as a preliminary step to the establishment of insurance.

During World War I, employment in the insured trades was good and, though the collection of contributions went on, very little was paid out in benefits. The result was a succession of surpluses of income over expenditure down to the end of the war. In 1916 an act was passed which brought into insurance for a period of five years or until three years after the end of the war, whichever was longer, certain additional trades and all munitions workers not already insured. The chief trades brought in were the metal, chemical, rubber, leather and ammunition trades. Thus, the total number covered by the insurance scheme at the end of 1916 was about 3,750,000, of whom about 1,000,000 were females. These

workers were brought into the scheme because it was anticipated that there would be considerable unemployment among them on the cessation of hostilities No changes were made in the rates of contributions or benefit or in the general conditions. Benefits for men and women were the same, 7s. a week for adults.

Out of Work Donations Act and Doles.—The British plan has been basically an *insurance* plan throughout its history. Employers and employees have both paid specified contributions for the purchase of definite benefit rights for insured workers Down to Nov. 1918, it followed this insurance principle strictly Then, in order to cope with the serious unemployment of ex-servicemen and former war-industries workers, the Out of Work Donations act was passed, under which more than £40,000,000 was paid to ex-service people and more than £21,000,000 to civilians These funds were not raised through insurance They were provided by vote of parliament. But they were disbursed through the machinery of the unemployment insurance system and for a time the Donations act virtually superseded the Insurance act. After that time the policy of using the machinery of the act to distribute unemployment relief, supplementary to the insurance, was used almost continuously until the 1934 revision when a separate administrative agency was created, the Unemployment Assistance board, to handle the "dole," leaving to the ministry of labour the administration of unemployment insurance Thus, after 16 years of experimentation with mixed unemployment insurance and unemployment relief, the British separated them and went back to their insurance system, but not to as pure insurance as before 1918, since the dependents' benefits started in 1921 remained a part of the benefits structure.

The Act of 1920.—After the war the subject of unemployment insurance was examined by a number of committees, all of which reported in favour of the extension of the scheme. The problem faced in 1920 was that if the contributory features of the Insurance act were maintained and enforced, about 500,000 genuine unemployed would be forced either to become "paupers" and obtain support from the local poor law authorities or to find some other means of existence, with the added probability that the financial structure of many local governments would break down. The institution of the out-of-work donation scheme and the need for awaiting the resettlement of industry into its peacetime occupations postponed for a time the extension that was generally anticipated and desired, but in Dec 1919 a bill for this purpose was introduced and was passed into law in Aug. 1920

The Unemployment Insurance act, 1920, repealed all earlier enactments and, with amendments, remained the foundation of the scheme until 1934.

It came into force on Nov. 8, 1920, and brought into insurance an additional 8,000,000 persons, making, with those insured under the earlier acts, a total of about 11,750,000 persons insured against the risk of unemployment. The scheme as extended by the act of 1920 applied to all persons of 16 years of age and upward employed under a contract of service or apprenticeship (except apprentices without a money payment), save those in certain excepted employments, the chief of which were agriculture and private domestic service.

The permanent employees of government departments, local authorities, railways and general utility companies were also excepted.

Nonmanual workers in receipt of remuneration exceeding £250 a year were also excepted. Contributions ceased to be payable by the employed person, and he ceased to be entitled to benefit, on reaching the age of 65, but the employer remained liable for his share of the contributions.

About half the unemployed were unable to qualify for benefits under the existing rules; *i.e.*, 1916 act rules The new act extended to all covered by it benefit rights on substantially the same terms as to contributors who had been paying for their benefits In addition, the weekly benefit rate was increased to approximate the cost of livelihood and in 1921 dependents' benefits were added, which incorporated relief allowances into the insurance scheme This union of insurance and relief continued until the scheme was reorganized in 1934. **Moreover, no test of means or needs was set** up for the insured class. The waiting period was reduced from six days to three days. Thus was the most costly alteration made during the passage of the bill through parliament

Because of these changes made during the passage of the bill, changes which increased the cost of the scheme, the contributions of employer and employed were increased and, instead of being, as intended, in the case of adult male contributors, 3*d* from employer, 3*d*. from employed and 2*d* from the exchequer, the amounts became 4*d*., 4*d*. and 2*d*. respectively. Thus, instead of paying one-fourth of the total contribution, the exchequer paid one-fifth. Benefit was payable in proportion to the number of contributions previously made and subject to a maximum of 15 weeks' benefits in a year as in 1911, but instead of one week of benefit for every five contributions, the rule was one week's benefit for six contributions, hence the "1 in 6 rule" The weekly rate of benefit was increased and the act of 1920, following the precedent of the out-of-work donation scheme, prescribed different rates for men and women, the former being entitled to 15s. and the latter to 12s. Boys of 16 to 18 received 7s. 6d. and girls of the same age 6s. a week. The reserves which the fund had in 1920 were quickly dissipated and the fund ran far into debt. The whole conception of a contributory insurance scheme bid fair to be extinguished

Statistical Basis of the Scheme.—Upon the data available when the act was being framed, it was assumed that over a period or cycle of good, bad and average years of trade the rate of unemployment among workers in the trades to be insured would be 4% The act of 1920 contained, as explained later, provisions enabling industries to contract out of the general scheme It was estimated that after allowing for the withdrawal of those industries that might be expected to contract out, the industries that remained in the general scheme would have an unemployment experience of 5.32% over a cycle. It was upon this basis that the finance of the scheme was founded There was no real opportunity to test the soundness of these assumptions up to the start of World War II because of the much greater severity of unemployment (1930–39) than the actuaries had anticipated. Material alterations in the contributions and benefits had changed the act so much that the original calculations were not applicable. The conditions and disqualifications for benefit were almost identical in 1930 with those under the act of 1911 and need not, therefore, be repeated The machinery of adjudication upon claims (viz., the insurance officer, court of referees and the umpire) was maintained.

The act of 1920 contained two provisions for enabling persons who would not otherwise have been qualified to draw benefit under the scheme. The first was that men discharged from the forces should be given a free credit of contributions to enable them to receive up to the maximum period payable during 12 months; this was at first 15 weeks and later 26 weeks in a year. The other special qualifying condition was temporary. It was that during the first 12 months of the scheme benefit might be paid up to a maximum of eight weeks as soon as an insured person had paid four contributions. This was to provide for new entrants who had had no opportunity to satisfy the statutory condition of the payment of 12 contributions. Even this relaxation of the normal condition did not prove adequate to meet the situation which arose. The act of 1920 began to operate just when the severe industrial depression began. To meet this situation an act was passed enabling eight weeks of benefit to be paid to persons who had been engaged in insurable employment during ten weeks from Dec. 1919 or during four weeks after July 1920. Even this proved insufficient, as will be shown.

The right of employers to receive a refund of a part of the contributions paid in respect of workmen in their regular employment was not continued, but the practice of refunding to workmen their share of the contributions paid in respect of them, less any benefit they had received, was retained. This right of the workmen was, however, abolished in 1924.

An important new feature was included in the extended scheme of 1920. Power was given to an industry to set up a special scheme of unemployment insurance for itself and so contract out of the general scheme. Such a scheme when approved had statutory force and effect and was binding on all employers and workers

in the industry. The chief conditions which applied to a special scheme were that it must cover all persons employed in the industry; the benefits must be, on the whole, not less favourable than those provided under the general scheme; the state contribution would be on a reduced scale; and the scheme would be administered, not by a government department, but by a joint body of employers and employed in the industry.

It was expected that several industries with low rates of employment would contract out of the general scheme and a number prepared to do so, but because of the severe trade depression which began in the autumn of 1930 only two industries formed special schemes; viz, the insurance and banking industries. The power of contracting out was suspended as from July 1931 and was abolished by the act of 1927.

Twenty Acts (1920–30).—After the principal act of 1920, no less than 20 acts of parliament dealing with unemployment insurance were passed down to June 1930, while contributions under the scheme were dealt with in two other measures. The need for this mass of legislation was in the wholly exceptional mass unemployment which began in the autumn of 1920, just when the scheme commenced, and continued until World War II. These several acts had one main purpose; viz., to enable benefit to be paid to those persons normally employed in the insured trades who were unable to satisfy the usual requirement of the prior payment of contributions The general trend was toward more generosity in dealing with the needs of the unemployed. The act of 1930 marked the extreme relaxation of the benefit rules. It opened the door to claimants who had no moral right to benefits, especially married women and seasonal and casual workers who merely "signed on" at the labour exchanges because there was a chance for benefits. The legislation which followed the principal act brought into existence a system of additional benefit which was first called "uncovenanted" and later "extended" benefit. The most important and serious effect of these extensions of rights of benefits to persons who had not earned them through previous contributions was that British workers came to regard the employment exchanges as banks where they always had a balance upon which, subject to the rules, they always had a legal right to draw without query into their need for the benefits. This sense of rights became a part of British social life.

Uncovenanted Benefit.—Persons who desired to obtain the advantage of this extended system of benefits although they had exhausted all their contributory rights, or even although they had paid no contributions at all, were required not only to fulfil all the usual conditions for covenanted benefit (except those relating to contributions), but also to satisfy certain additional conditions. These extra conditions varied somewhat from time to time, but in the main they required the claimant to show that he was normally employed in an insured trade, that he had done what, in the circumstances of his case, could be regarded as a reasonable amount of work in a recent period, and that he was making every reasonable effort to obtain work suited to his capacities

The various measures dealing with uncovenanted benefit proceeded for some time on the basis of allowing it to be drawn for a stated number of weeks during certain periods which were termed special periods. It was found that the provision so made did not meet the needs of the case and that many insured persons were obliged to apply to the poor law authorities for relief, during the intervals, or "gaps" as they were termed, between the periods for which benefit was payable. From time to time the number of weeks for which benefit might be drawn during the special periods was extended and increased and the gaps were reduced in length and finally abolished.

The additional conditions which had to be fulfilled by recipients of extended benefit were in general of such a character that they did not readily lend themselves to precise adjudication or determination by the authorities set up to give decisions on the normal conditions. Partly for this reason, partly in order to ease the burden which would otherwise have fallen on the ordinary machinery, the work of advising whether or not extended benefit should be allowed in individual cases was given to the local employment committees, bodies which had been appointed by the minister of labour to advise him on the employment position in the areas of the employment exchanges and generally on the work of the exchanges. These committees were representative of the employers and employed in each district and had additional members nominated by other bodies such as boards of guardians and ex-servicemen's associations.

As a further means of meeting the need for exceptional assistance to the unemployed a measure which, in its title, was described as a temporary provision, was passed in Nov. 1921, by which an insured person in receipt of unemployment benefit became entitled to receive in addition 5*s.* a week for his dependent wife and 1*s* a week for each dependent child. This act was intended to operate for six months only, but the provision made under it for adult and juvenile dependents was made part of the general unemployment insurance scheme early in 1922. The classes of persons in respect of whom the 5*s.* allowance might be paid were also extended and the rate for children was increased to 2*s.* a week

Cost of the Depression.—In order to meet the increased expenditure due to the long continued depression and to the grant of extended and dependents' benefit the contributions of all three parties—employers, employed and the exchequer—were raised and power was given to borrow up to £30,000,000. The contribution in respect of a man became 2*s.* 1½*d.*, borne as to 10*d* by the employer, as to 9*d.* by the employed and as to 6½*d.* by the exchequer. This was, later, reduced to 1*s.* 9*d* , the three parties paying 8*d.*, 7*d.*, and 6*d.* respectively. There were variations also in the rates of benefit. Starting in 1920 with 15*s* for men and 12*s.* for women these rates were raised to 20*s.* and 16*s.* respectively in March 1921, but were reduced to 15*s.* and 12*s.*, again from the end of June 1921. As from Aug 1924 they were again increased to 18*s.* for men and 15*s.* for women. The changes in rates under the acts of 1927 and 1930 are mentioned later. It is right to say that the various acts of parliament passed from the end of 1920 to 1926 inclusive were all regarded as emergency measures and that the extended benefit paid under them was regarded as paid in advance of future contributions. No separate account was kept of the cost of extended benefit but for some time before April 1928 probably more than half the persons in receipt of benefit were drawing extended benefit. The amount of the debt varied considerably. The borrowing power was first exercised in July 1921. By the end of the year the debt was £7,000,000. It reached £17,060,000 in March 1923, but fell to £5,000,000 in 1924. It rose again to nearly £25,000,000 in March 1927 largely in consequence of the severe unemployment due to the coal dispute which lasted for six months or more in 1926.

During 1925 and 1926 the whole subject of unemployment insurance was examined by a committee under the chairmanship of Lord Blanesburgh. They made a number of important recommendations for the amendment of the scheme with a view to putting it on a sound and permanent basis. In particular they advised the abolition of the dual benefit system; *i.e.*, the concurrent existence of standard and extended benefit. The recommendations of the committee were accepted in principle by the government, and with one main exception were passed into law by the Unemployment Insurance act of 1927. That act made a number of changes in the scheme, dealing among other matters with the rates and conditions of benefit, the creation of a class of young persons between 18 and 21 years of age, the abolition of extended benefit and of contracting out.

During the years 1931–34 unemployment insurance became a menacing factor in British public finances and a major factor in political party struggles In 1931, expenditure for contributory and noncontributory benefits was at the rate of £125,000,000 a year, while the contributions of employers and workers were at the rate of less than £30,000,000 a year.

In addition, the government was spending approximately £30,000,000 on relief works.

On Nov. 12, 1931, benefit rates were cut 10% (adult males from 17*s.* to 15*s.* 3*d.* and females 15*s.* to 13*s.* 6*d.*, and adult dependents from 9*s.* to 8*s.*), and their duration to 26 weeks per year. These new rates remained in effect until the 1934 law went into effect on July 1, 1934, when the 1930 rates were restored, but every claim-

ant was made to prove 30 contributions in the two years preceding the date of his claim. These restrictions excluded over half of the current list of claimants from drawing insurance benefits as a right They cut off more than 1,000,000 persons. These were now offered a new relief called "transitional payments" *subject to a means test* These payments could not exceed what the person in question would have drawn under insurance, but they might be less. The exchequer footed the bill. In addition, stiff regulations were made to deter married women, seasonal and casual workers, and semi-retired persons from obtaining either insurance or transitional payments.

This purge, together with the means test, was deeply resented by many poor people. The rolls were reduced by approximately 200,000 persons, equivalent to a saving of £10,000,000 a year. Another effect was a substantial increase in private relief for the unemployed.

The constructive results produced by the new transitional payments scheme were that it reintroduced the giving of noncontributory relief according to needs instead of as a right, and that it kept thousands of people from making applications who could not apply on a basis of need but did apply when public "doles" were given as a right at fixed rates and without requiring previous insurance contributions.

The act of 1934 thus created, parallel to the unemployment insurance system, a national system of assistance for those unemployed who were without insurance rights, administered by a new national administrative agency, the Unemployment Assistance board.

Relief payable for other reasons than unemployment still remained a local function. The act also expanded the insurance scheme to the widest insurance coverage it had ever had and restored the 1931 cuts in rates. A steady contributor could now draw a maximum of 52 weeks' continuous benefits if necessary. Certain classes of agricultural workers and domestic servants were able to come under the act. As set up by the 1934 act, the administration of the unemployment insurance scheme remained in the ministry of labour, with a new body, the Unemployment Insurance Statutory committee, empowered to watch the operation of the scheme and act as official advisers both to the ministry and to parliament.

In 1936 coverage was expanded to include 600,000 agricultural workers in a separate scheme in which contribution and benefit rates were lower than in the general scheme

The separation of unemployment assistance from insurance, accompanied by the improved economic conditions in the late 1930s, resulted in a greatly strengthened financial position for the unemployment insurance fund. Whereas under the 1934 act the debt of the fund to the exchequer had been funded at £105,800,000, to be repaid at the rate of £5,000,000 annually, the insurance surpluses permitted a much faster rate of repayment. During World War II, the debt was paid in full and a large reserve accumulated (approximately £500,000,000 in 1948, when the fund was merged with the National Insurance fund). Coverage was expanded in 1940 to cover nonmanual workers earning up to £420 per year.

Benefit and contribution rates were increased periodically, so that by the time the national insurance program went into operation in 1948 the adult unemployed person (man or woman) was receiving 24*s.* per week. The adult dependent's benefit was 16*s.* weekly, and the rate for the first two children was 5*s.* each, plus 4*s.* each for any subsequent children. Contributions were 10*s.* each per week from employer and insured adult male worker; the government contributed at one-half the joint employer-employee rate.

Effect of the National Insurance Act of 1946.—As a result of the Beveridge report of 1942 and subsequent deliberations, all legal provisions respecting unemployment insurance were incorporated in the National Insurance act (9 & 10 Geo. 6, ch. 67, Aug. 1, 1946), which also governed cash benefits for sickness, maternity, retirement and death.

The effect on unemployment insurance was less pronounced than in the case of health or pensions, where the benefits had been lower but were now made uniform at the same rate for all risks.

Coverage was extended to all persons aged 16 to 65 (60 for women) employed under a contract of service. As a result, the number of covered workers in July 1948 under the National Insurance act was estimated at 20,500,000 in Great Britain, as compared with the 16,100,000 who had been covered immediately before the new program began to operate. The agricultural scheme as well as the separate schemes in insurance and banking were merged with the general system. Contributions were payable by the employer, the employed person and the exchequer, but were part of the total national insurance contribution.

The unemployment insurance contribution was not separate. In the actuarial calculations employed to determine the contribution, it was judged that unemployment would be on the average 8.5% of the total number of covered workers During the early years of the new program the rate of unemployment was much lower—generally from 1% to 2%.

Benefits became payable, after a three-day waiting period, at the rate of 26*s.* per week for persons over age 18, 20*s.* for married women; and 15*s.* for persons under age 18. In the case of a married woman or young person entitled to an increase for an adult dependent, or in the case of a married woman with a dependent child, the rate was set at 26*s.* An additional 10*s.* per week was payable for an adult dependent, and 7*s.* 6*d.* for the first child (the others being covered by the family allowance program). The conditions for receipt of benefit were the payment of 26 contributions between entry into the system and the day for which benefit was claimed, with an average of 50 contributions paid or credited (for periods of unemployment, sickness, etc.) in the last contribution year.

Standard maximum duration of benefit was 180 days; after five years' coverage this might be gradually increased for additional contributions (not offset by benefits) up to 130 days more. Extended benefit might then be awarded by local tribunals after taking into account the claimant's circumstances but without imposition of a means test. Extended benefit was payable by the local offices of the ministry of labour and national service in the same way as unemployment benefit.

The claimant was disqualified (except in special circumstances) during a work stoppage resulting from a labour dispute, and for a period no longer than six weeks in the following cases: (1) misconduct or voluntary leaving without just cause; (2) refusal without good cause to apply for employment after notification or to accept it when offered; (3) neglect to avail himself of a reasonable offer of suitable employment; (4) failure to carry out reasonable written instructions of the employment exchange to help him find employment; and (5) refusal of training.

Administration of the general national insurance scheme was placed in the hands of the ministry of national insurance. The employment exchanges, however, were operated by the ministry of labour and national service, and the office of the latter ministry also paid unemployment benefit. (J. F. G. P.; D. D. L.; X.)

UNITED STATES

The most important unemployment insurance events in the 1930s were the establishment of unemployment insurance in the U.S., 1932 *ff.*, and in Sweden in 1934, and the reorganization of the British system in 1934, already described. Futile efforts to enact unemployment insurance in Massachusetts in 1916 and in several other states in subsequent years were followed by the passage of the first U.S. unemployment insurance law in Wisconsin in Jan. 1932. Previous to that time, U.S. experiments with unemployment insurance were limited either to single plants or portions of an industry and probably covered fewer than 150,000 persons.

They were plans either initiated by employers or adopted by joint agreement between labour unions and employers. Systems of union benefits against unemployment, in which the benefit funds were raised and administered by the unions themselves had never been very extensive in the United States. In that respect U.S. labour history differed sharply from that of Europe.

The cornerstone of unemployment insurance in the United States was laid by the enactment in Aug. 1935 of the Social Secu-

rity act. This act followed the recommendations of the Committee on Economic Security, appointed by Pres. Franklin D. Roosevelt in 1934, for a co-operative federal-state system. But it contained very strong inducements to all states to adopt unemployment insurance laws.

Title III of the act provided for federal grants to the states for the total cost of administering unemployment insurance laws, if certain general statutory and administrative standards were met

Title IX (the tax features of which later became a chapter in the internal revenue code) imposed a pay-roll tax on all employers having eight or more employees in "covered" employment, 90% of which could be offset if the employer was liable for unemployment insurance taxes under a state law meeting certain general standards These inducements were strong enough to bring about enactment of unemployment insurance laws in every state, the District of Columbia, Alaska and Hawaii, before July 1, 1937. Later, in 1938, a special federal system was adopted for the railroad industry.

Generally speaking, the U.S. unemployment insurance laws had as their objective the protection of the regularly employed who became unemployed because of lack of work and were able and willing to accept suitable employment. A basic characteristic was that it provided income as a matter of right without inquiry into the needs and resources of individuals. The income provided was in the form of a weekly benefit related to prior wages, intended to be sufficiently large to cover the workers' nondeferrable expenses but not so large as to reduce work incentives.

The objective was to provide benefits for a period long enough to tide most workers over spells of unemployment between jobs, making it unnecessary for them to turn to other programs for aid, when unemployed. Another purpose was to accumulate funds during periods of high-level employment, for use during periods when benefit expenditures increase. Through continuous contact with public employment offices, speedy absorption of claimants into employment was facilitated.

The U.S unemployment insurance system involved close cooperation between the federal government and the states. Each had essential functions to perform. There was no national unemployment insurance law except for railroad workers; there were 51 state, territorial and district laws, each of which had been influenced by federal legislation, and the administration of which was subject in certain aspects to federal supervision.

Federal Responsibility.—The Social Security Act of 1935 created a Social Security board to administer the various provisions of the act including the federal government's responsibilities for unemployment insurance as defined in titles III and IX of the act. After June 1939 the Social Security board exercised its function under the direction and supervision of the administrator of the Federal Security agency.

Federal responsibilities in the federal-state unemployment insurance program were carried on through the bureau of employment security.

The United States employment service, created by the Wagner-Peyser Act of 1933, was transferred by congress from the U.S. department of labour to the Federal Security agency on July 1, 1948, and became a part of its then bureau of employment security.

On Aug. 20, 1949, Pres. Harry S. Truman transferred the bureau of employment security to the department of labour and vested in the secretary of labour responsibility for carrying out the provisions of the Wagner-Peyser act and titles III and IX of the Social Security act and certain provisions of the Federal Unemployment Tax act.

The bureau set up central units to service both the employment service and the unemployment insurance service. Regional offices maintained direct relations with state administrative agencies.

The responsibilities of the federal agency were primarily to determine that the state laws were in conformity with requirements of the federal act, both for the purpose of enabling employers subject to the federal tax to secure credit with respect to their liability under the state laws and for the purposes of federal grants for administration. In addition, the federal agency determined, within the amount authorized by congress, the amounts to be granted to the individual states for the proper and efficient administration of their laws.

The federal agency also served in clearing-house and service capacities to promote most efficient methods of administration and was also charged with the responsibility for making studies and recommendations to improve provisions for economic security.

Among the requirements that a state law had to meet to enable employers to secure credit against the federal tax were: that benefits be paid through public employment offices; that all taxes (usually called contributions) collected under the state law be deposited to the state's credit in the trust fund in the United States treasury from which they could be withdrawn only for the payment of benefits; that unemployment insurance not be denied "to any otherwise eligible individual for refusing to accept new work under any of the following conditions: (1) if the position offered was due directly to a strike, lock-out, or other labour dispute; (2) if the wages, hours or other conditions of the work offered were substantially less favourable to the individual than those prevailing for similar work in the locality; (3) if as a condition of being employed the individual would be required to join a company union or to resign from or refrain from joining any bona fide labour organization."

In determining whether a state was entitled to federal grants for the costs of administration, the secretary had to find in the state law methods of administration, including those relating to the establishment and maintenance of personnel standards on a merit basis, reasonably calculated to insure the full payment of benefits when due, and provisions for a fair hearing to anyone whose claim for benefits was denied. In addition he had to find that there had not, in a substantial number of cases, been a denial of benefits due under a state law. The states were also required to make such reports on their operations as the secretary found necessary.

Grants for the costs of administration were generally made quarterly or semiannually. At mid-century the total of such grants for the administration of unemployment insurance and of the employment service totalled more than $140,000,000 annually.

State Responsibilities.—The state administrative set-ups differed widely from state to state—at mid-century 19 were administered by independent boards or commissions, 13 by independent departments reporting directly to the governor, 17 in state departments of labour, and 2 in state workmen's compensation agencies. The state agency had to be equipped to collect and record contributions, receive and pass upon claims for benefits, pay benefits, adjudicate disputes over benefits, manage state budgetary functions connected with the administration of unemployment insurance, and allied responsibilities including furnishing to the secretary of labour such reports and in such form as he might require. A nation-wide system of public employment offices, affiliated with the United States employment service of the bureau of employment security, although financed wholly by federal funds, was administered by the same state agency.

The states were free to enact unemployment insurance laws with such coverage and benefit provisions as they desired. However, with respect to both coverage and the financial structure, state laws were strongly influenced by the provisions of the federal Unemployment Tax act.

Coverage.—Coverage of the federal act was restricted, as a temporary measure, to the larger employers—those employing eight or more workers in 20 weeks in a calendar year, and 28 of the state laws adopted the same restriction. By mid-century, the federal act had remained unchanged, but only 22 states restricted coverage to employers of eight workers, 17 covered employers of one or more, and in 12 states, there were variations from three to six workers.

Workers in agriculture, domestic service, nonprofit, religious, educational and charitable organizations, and in federal, state and local government employment were also excluded from the program's protection. Because of the growth in employment and the rise in the labour force, coverage under the unemployment insurance program had increased from 20,000,000 in 1938 to about 33,000,000. Approximately 13,500,000 wage and salary workers were still outside the program at mid-century.

Benefits.—The principle of basing a worker's rights to benefits on his employment and earnings during a preceding period was common to all state laws. The specific provisions of the different laws differed considerably in this particular. The qualifying requirements attempted to measure his attachment to the labour market by requiring that he had earned a minimum amount of wages or had worked a certain number of weeks within a late period; most laws attempted to assure that he had worked more than 13 weeks in the year preceding his employment.

Before drawing any benefits, all state laws required a one-week waiting period except four which required a 2-week period, and two which required none.

Weekly benefits payable for total unemployment were based, as in state accident compensation laws, upon a percentage of the worker's earnings rather than upon the flat benefit rate used in England. While the original objective was to provide 50% of wages, the rise in weekly wages immediately before and following World War II outstripped statutory maximums, with the result that weekly benefits fell below that ratio in all states

In 41 states, at mid-century, the benefit rate was a specified percentage of the total wages earned in the highest calendar quarter in a late period Average benefits were about $21, as compared with $11 in 1938 To assure that unemployed workers with dependents received a sufficiently high percentage of wages to be able to purchase nondeferrable necessities when out of work, 11 state laws provided additional allowances for dependents. Minimum weekly benefits were around $5 to $6, and maximums varied from $15 to $26 for states without dependents' allowances and from $20 to $40 for states with such allowances.

The maximum potential benefits available to a claimant during a year was not the same in all states. Fifteen states allowed potential benefits for the same number of weeks (calculated as a multiple of the weekly benefit amount) to all workers meeting the qualifying requirement. Thirty-six states limited the worker's total benefits to a fraction of his annual earnings or (in two states) limited the duration by a fraction of the number of weeks worked.

Since 1939, the potential duration of benefits had increased from an average of less than 13 weeks to about 21 weeks The largest number of states provided a maximum of 20 weeks; 22 states, however, provided a maximum of more than 20 weeks, in 13 of these it was 26 or more. Despite the increase in potential duration, about three out of ten claimants exhausted their benefits rights during the two years ended July 1, 1949, before finding new jobs or returning to their former jobs

Disqualifications.—Under all state laws benefits might be denied if the worker's unemployment was due to certain specified reasons; generally, if he had been discharged for misconduct connected with his work, had voluntarily left his work or refused an offer of suitable work without good cause, or if his unemployment was due to a labour dispute.

While all laws postponed eligibility for benefits for a specified period for the above reasons, many also cancelled benefit rights for the same or a shorter period.

Financing.—The idea that unemployment insurance taxes would stimulate employers to reduce unemployment greatly influenced U.S. legislation in this field The concept of merit or experience rating, as it was generally called, was based upon the assumption that if employers could reduce their taxes thereby, they would take steps to reduce unemployment.

Experience did not demonstrate that employers' rate reductions resulted from stabilized employment, induced by experience rating.

Beginning with the Wisconsin law, all state laws provided for modifying employers' contribution rates in accordance with their experience with unemployment "or other factors directly related to unemployment risk." While most state laws varied employers' contribution rates in accordance with the relation between benefits paid to their former workers and charged to their "accounts," contributions paid, and their average annual pay roll, other states used measures taking less direct account of such benefit payments. Later, five states adopted plans based upon pay-roll fluctuations and designed to avoid the undesirable effects of other plans in creating adverse employer interest in the payment of benefits to their former workers.

As a result of the high pay-roll and employment levels during most of the program's history, and especially after 1941, employer tax rates were sharply reduced from the 2.7% rate at which they began Average tax rates fell to about 1.2% by 1947 and were still about that level at mid-century.

State Administration.—Certain administrative arrangements involved in operation of the unemployment insurance program were common to all states. Every claimant for benefit had to file his application for benefits at a public employment office and at the same time apply for work Certification by the employment office of a registration for work was a prerequisite to the receipt of benefits.

A report from the employment service or an employer that an applicant had refused suitable employment offered him held up his right to benefits until it could be determined whether the refusal was justified. Each state law decided what constituted "suitable employment."

Machinery and procedure to investigate and settle disputed claims became a vital part of unemployment insurance administration.

Procedure was substantially the same in all states A deputy of the state administrative officer first passed upon the claim or, if it involved a question he could not resolve, referred it to an appeal tribunal.

Either the claimant or an interested employer might request a hearing before an appeal body on any decision denying or allowing benefits Decisions of the appeal tribunals might be appealed further either to the state administrative agency or an independent review board, according to state law Further appeal might also be made to the courts in the same manner and under the same limitations as other legal matters. (*See* also SOCIAL SECURITY.)

Temporary Disability Insurance Co-ordinated with Unemployment Insurance.—By mid-century, four unemployment insurance programs had been expanded to provide weekly cash benefits to workers whose unemployment was due to inability to work as well as to those unemployed because of lack of work These were the laws of Rhode Island, expanded in 1942, California, 1946, the federal Railroad act, 1947, and New Jersey, 1948. These four temporary disability insurance or cash sickness insurance laws covered the same workers and paid benefits according to the same schedule as the unemployment insurance laws with which they were jointly administered. In addition, New York in 1949 enacted a disability benefits law not co-ordinated with unemployment insurance.

About 5,300,000 workers, 16% of the U.S. workers covered by unemployment insurance, were covered by the programs co-ordinated with unemployment insurance. The Rhode Island and California programs were financed by a 1% worker contribution which had formerly been paid for unemployment insurance. In New Jersey, workers paid three-fourths of 1% and employers, one-fourth of 1%, while the railroad program was financed by an employer tax formerly paid for unemployment insurance alone

Temporary disability insurance benefits were paid under all the laws to workers unable to perform their usual work because of illness or accident. California and New Jersey excluded disability resulting from pregnancy; those two and the railroad program excluded disabilities covered under the workmen's compensation laws. All four required an unpaid waiting period of the first seven-day period of disability in a benefit year; California and New Jersey required similar periods with future spells of disability, while Rhode Island did not, although only disabilities lasting at least seven consecutive days were compensable. To draw benefits, claims filed by mail had to be supported by medical certificates.

The outstanding difference among the laws was the provision made by California and New Jersey permitting individual establishments to substitute private group insurance for the state plan More than one-third of the covered workers in California, and about two-thirds of those in New Jersey were under such private plans.

The New York law put primary emphasis on private insurance, state coverage was not automatic, but had to be purchased in the same manner as private coverage.

OTHER COUNTRIES

Unemployment insurance programs had been adopted by 23 nations at mid-20th century, including the cash benefit plans of Australia and New Zealand, and the limited-coverage programs in Chile (for salaried employees only), Greece (where operations were limited to certain areas), and Uruguay (with special schemes in the wool-and-hide and cold-storage industries, as well as pensions for unemployed persons with long coverage under the retirement system). Nineteen plans were compulsory and four (Denmark, Finland, Sweden and Switzerland) were government-subsidized trade-union plans

The European countries with programs in operation, with date of the first laws, were: Denmark (1907), Netherlands (1916, voluntary system which was discontinued during World War II; compulsory scheme, 1949), Finland (1917), Italy (1919), Austria (1920), Poland (1924), Switzerland (1924), Bulgaria (1925), Germany (1927), Belgium (1933), Sweden (1934), Norway (1938) and Greece (1945).

The Irish system went back to 1911, the date of the first British National Insurance act In France and Spain the voluntary plans dating from 1905 and 1919, respectively, had been replaced in France by unemployment assistance and in Spain by public works In the U S S.R unemployment insurance was discontinued in 1930; in Czechoslovakia, it was discontinued in 1948

Outside Europe, unemployment insurance had been adopted by the United States (1935), Chile (1937), the Union of South Africa (1937, expanded 1946), Canada (1940) and Japan (1947) New Zealand cash benefits dated from 1938, and the Australian scheme from 1944; both programs required an income test but were part of unified social security programs. Uruguay's first special program of unemployment insurance was established in 1944.

The scope of the several schemes naturally varied in the different countries since the need of insurance against the unemployment of classes of the population varied widely. The conditions to be satisfied under the various national systems differed in points of detail, but there were broad lines of resemblance in most of them. For instance, the unemployment against which the worker was insured was involuntary unemployment. Nor would he be paid benefits under the schemes if there was suitable employment which he could take up. In this connection it was worthy of note that in countries which had instituted compulsory systems the example of Great Britain had been followed by setting up systems of employment exchanges by means of which the existence of suitable employment might be known and jobs offered to the unemployed

The loss of work through a labour dispute in which the worker was involved was commonly a reason for disqualification although there were various refinements on this point; *e.g.*, the duration of the disqualification might be for the period of the dispute or for any period after it had ended until the worker was again employed. Voluntarily leaving work without good cause and dismissal for misconduct were also generally grounds for refusal of benefit.

The financing was variously accomplished, but in 11 of the 23 systems the insured, the employer, and the government all contributed. In 5 countries the employer was the only contributor and in 1 the employee was the sole support. In 3 systems the insured and the employer shared the cost; and in 3 (all subsidized trade-union plans) the insured and the government provided the funds.

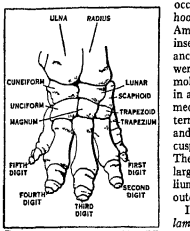
UNGAVA, originally the native name for the region south of Hudson strait and thus a part of the historic Rupert's Land (*q.v.*) The name was adopted officially by Canada by order in council Oct 2, 1895, as that of a district of the Northwest Territories. But the Boundaries Extension act of 1912 annexed Ungava to the province of Quebec. The northern portion of this province is bounded by Hudson bay on the west; Hudson strait and Ungava bay on the north; and the coast strip of Labrador on the east. The area is estimated at more than 300,000 sq.mi. and includes much of the lower portion of Labrador, with a rim of recent marine deposits along its western coast, but the interior has the usual character of low rocky hills of Archean rocks, especially granite and gneiss, with a long band of iron-bearing rocks, resembling the Animikie, or Upper Huronian of the Lake Superior region, near its eastern side. Along Hudson bay shore there is a strip of similar rocks, and a long row of small islands of the same age, with great sheets of trap or diabase forming the tops of the hills. In 1949 intensive development began on a proven initial reserve of 300,000,000 tons of high-grade iron ore located in roughly the centre of Ungava. Recovery involved creation of a seaport at Sept Iles, Que., on the Gulf of St. Lawrence, and building a 360-mi. railway to the ore field. Ungava, like the rest of Labrador. has risen several hundred feet since the Ice Age, marine beaches being found up to 700 ft on the Hudson bay side, and it is interesting to find seals like those of the adjoining sea coasts in the Seal lakes 100 mi inland and 800 ft. above the present sea level Because of its northerly position a large part of Ungava is treeless, and belongs to the barren grounds where caribou roam and feed on the so-called caribou moss, a grayish lichen. Until the mining development began, Ungava inhabitants were chiefly migratory Eskimos, wards of the government. Pop. (1951) 4,470. (C. Cv)

UNGER, FRANZ (JOSEPH ANDREAS NICOLAUS) (1800–1870), Austrian physician and botanist, was born at Amthof in Steiermark on Nov. 30, 1800. He studied medicine in Graz, Vienna and Prague He practised in Stockerau and Kitzbühel and in 1833 became professor of botany at the University of Graz. In 1849 he went to Vienna to occupy the chair of plant physiology. In 1866 he retired to live in the country near Graz where he died on Feb. 13, 1870. Unger made many contributions to the understanding of plant anatomy and physiology, and was also much interested in plant palaeontology. Among his published works were *Die Exantheme der Pflansen* (1833); *Ueber den Bau und das Wachstum des Dikotyledonenstammes* (1840); *Anatomie und Physiologie der Pflansen* (1855); *Chloris protogaea, Beiträge zur Flora der Vorwelt* (1841–47); *Sylloge plantarum fossilium* (1860–64); *Versuch einer Geschichte der Pflanzenwelt* (1852); *Botanische Streifzüge auf dem Gebiet der Kulturgeschichte* (1857–67).



UNGER, RUDOLF (1876–1942), German writer and literary critic, born in Hildburghausen. He studied in the universities of Heidelberg, Munich and Berlin, and in 1911 became professor in literature at Munich. After 1921, he was professor of German literature at Gottingen. He was noted for his studies in the period of Goethe He edited *Obras de Goethe* (1910) and wrote *Philosophische Probleme in der neueren Literaturwissenschaft* (1908), *Weltanschauung und Dichtung* (1917), *Gesammelte Studien* (1929), etc. He died Feb. 5, 1942.

UNGULATA, an order or superorder of placental mammals including the hoofed herbivorous quadrupeds Aristotle in his work on *The Parts of Animals*, in describing the extremities of the viviparous quadrupeds, says that ". . . some are bifid and have hoofs instead of nails, as the sheep, the goat, the elephant, the hippopotamus; and some have undivided feet, as the solid-hoofed animals, the horse and the ass. . . ."

After the Renaissance, E. Wotton (1552), following Aristotle, divided the viviparous quadrupeds into the many-toed, double-hoofed and single-hoofed. In 1693 John Ray divided the viviparous quadrupeds into two grand divisions, the Ungulata, or hoofed, and the Unguiculata, or clawed, forms. The former were subdivided into: (1) the Monochela, or Solidipeda, with solid hoofs, including the horse, the ass and the zebra; (2) the Dichela, or Bisulca, with cloven hoofs; and (3) the Tetrachela or Quadrisulca, including the rhinoceros and hippopotamus. The Dichela were again subdivided into the Ruminantia, or ruminants, and the Non-ruminantia, or swine; the Ruminantia were finally divided into

those with permanent horns, namely the cattle, sheep and goats, and those with deciduous horns, of the deer kind. Here then was a usable and nearly correct classification of the ungulates before the beginning of the 18th century.

Subsequent discoveries have added to the Ungulata a great many extinct and some recent groups which were wholly unknown to Ray. Thus in Osborn's *Age of Mammals* (1910) the "Cohort Ungulata" includes no less than 13 "orders" of hoofed mammals. While each of these is a more or less natural group of animals related by descent from a common ancestral stock, the derivation and interrelationships of the orders themselves are still far from clear It is well established that the typical ungulates, namely the Perissodactyla (horses, tapirs, rhinoceroses, etc.) and the Artiodactyla (ruminants, swine, etc.) were wholly distinct from each other in the Lower Eocene, some 50 to 60 million years ago. It is indeed not improbable that the ungulate, or hoofed herbivorous type, was evolved several different times from different families of placental mammals of the Cretaceous period, or in other words, that many of the resemblances between ungulate orders are examples of either parallel or convergent evolution.

RIGHT FORE FOOT OF INDIAN ELEPHANT, SHOWING PARTS

Order Condylarthra.—In the Basal Eocene formations of New Mexico and in the Lower Eocene of Wyoming have been found the fragmentary jaws and teeth, and very rarely more or less entire skeletons, of small hoofed mammals which on the whole were *structurally* intermediate between the oldest creodonts or flesh-eaters, and the true ungulates. Of these the most primitive was the genus *Mioclaenus*, known chiefly from the conical-cusped upper molars, which recall those of such primitive carnivores (creodonts) as *Tricentes* and *Claenodon*. Somewhat higher in the scale was the group of species of the genus *Hyopsodus*; these little animals were about as large as a hedgehog, the skull being of remarkably generalized type. The dental formula, (Incisors $\frac{3}{3}$ Canines $\frac{1}{1}$ Premolars $\frac{4}{4}$ Molars $\frac{3}{3}$)$\times 2 = 44$, was that of other very primitive placental mammals. The crown-patterns of the molar teeth were advancing ever further away from the primitive tritubercular type toward the more typical condylarth types presently to be described.

By far the most famous condylarth was the Lower Eocene *Phenacodus primaevus*, an animal about as large as a Newfoundland dog, which has figured in many textbooks as the "five-toed ancestor of the horse." But W. D. Matthew has advanced decisive evidence against this view For in *Phenacodus* (*q.v.*) each quadrangular upper molar had four conical main cusps and two very small intermediate cusps or conules; whereas in the contemporary ancestors of the horse family the oblique crests of the molars were progressively developed Even in the Lower Eocene genus *Ectocion*, which was related to *Phenacodus*, the detailed patterns of the upper and lower molars were not quite right to be structurally ancestral to the molars of the primitive horses. Another Eocene condylarth, the genus *Meniscotherium*, had more complex upper molar patterns of the type known as buno-lopho-selenodont (*i.e.*, with cones, ridges and crescents), which in some respects foreshadow the general molar types of such later ungulates as the hyracoids, the chalicotheres and the litopterns.

The foot structure of the condylarths was likewise of interest. In the five-toed hind foot the ankle bones were much like those of a contemporary creodont, with a ball-and-socket joint at the lower end, an arrangement to which the name Condylarthra refers. In the fore foot of *Phenacodus* the two rows of carpal bones were placed directly above each other, "like unstruck bricks," whereas in typical ungulates a more displaced, or alternating arrangement, was the rule. E. D. Cope supposed that *Phenacodus* was in this respect also ancestral to later ungulates but Matthew showed that in both *Phenacodus* and the later ungulates the contrasting arrangements of the carpal elements above mentioned were probably both derived independently from the still older interlocking creodont type.

Amblypoda (*q.v.*).—In the basal Eocene of New Mexico occur the fragmentary remains of a diversified series of small hoofed mammals collectively known as Pantodonta or taligrade Amblypoda. Some of the smaller genera were hardly bigger than insectivores and with teeth suggestive of insectivore-creodont ancestry, while the larger taligrades (*Periptychus*, *Pantolambda*) were about the size and proportions of stocky badgers. The upper molar teeth in the smaller forms had three main cusps arranged in a triangle with the apex toward the inner side; the small intermediate cusps or conules were more or less circular; the main internal cusp was flanked by small cusps borne by the anterior and posterior ridges or cingula. In *Periptychus* the upper molar cusps were all subcircular and the enamel surface was pleated. The brain-cast indicates a brain of extremely primitive form with large olfactory lobes and a minimum development of the neopallium. In *Pantolambda* the upper molar crowns bore two sharp outer V's and a centrally placed conical internal cusp.

In all the taligrades the feet were short, especially so in *Pantolambda*. This feature becomes greatly emphasized in the later members of the order, the corypbodons and Dinocerata. *Coryphodon* is characteristic of the Lower Eocene of Wyoming and England. It was broad-headed and almost hippopotamus-like. Related forms have recently been found in the Eocene of Mongolia. *Uintatherium*, *Dinoceras* and their allies were characteristic of the later Eocene. Their bodies were gigantic, larger than modern rhinoceroses, with massive, post-like limbs and extremely short stubby toes. They had sabre-like upper tusks, six or more horn-like bony outgrowths on top of the skull and a brain of low type.

Notoungulata.—The condylarths and taligrades disappeared from the fossil record of the northern hemisphere in early Eocene, but there is some reason to believe that some of them reached South America and there gave rise to the amazingly varied series of herbivorous mammals which are often referred to collectively as notoungulates. These flourished for millions of years in Patagonia and adjacent regions, while the perissodactyls, artiodactyls and other ungulates held sway in the northern world. These notoungulates exemplified the law of adaptive radiation on a grand scale. Protected by geographical barriers from the deadly competition of their larger-brained northern analogues, they exploited all the economic possibilities for ungulates available in South America and gave rise to the wide diversity of forms that covered the ancient pampas. Some (the protypotheres) were small and swift-running like rabbits; others (the smaller litopterns) were like slender-limbed three-toed horses; some (*Macrauchenia*) paralleled the llamas and camels; others closely paralleled the rhinoceroses, while a few almost rivalled the elephants in bulk (*Pyrotherium*).

Litopterna (*q.v.*).—Among the most primitive of the entire series of notoungulates is the genus *Didolodus*, a small forerunner of the litopterns known only from the upper cheek-teeth, which in some ways recall those of the smaller taligrades. In the swift-footed proterotheres of the Miocene of Patagonia both cheek-teeth and feet suggest those of the Oligocene three-toed horses of the northern world. But in the upper molars the main inner cusp is central rather than anterior in position and the posterior cross-crests fail to meet the middle point of junction of the two main outer cusps, as they do in the three-toed horses, while the feet, although superficially horse-like, differ profoundly from the horses in the detailed arrangements and contacts of the tarsal elements. The larger litopterns (*Theosodon*, *Macrauchenia*), while in general appearance paralleling llamas and camels, yet are more nearly related to the horse-like proterotheres in their deeper characters.

Notioprogonia.—In the "*Notostylops* beds" of Lower Oligocene or Upper Eocene in Patagonia occur a strange group of ungulates, varying in size from a rabbit to a rhinoceros. Of these the most famous form, *Notostylops*, had a small skull in which the upper grinding teeth have oblique and flattened outer walls remotely

suggesting those of recent rhinoceros. The lower molars bore long obliquely-placed blades on the hinder part or talonid The skull as a whole suggests that of the recent *Hyrax*. In certain early members in which the feet are known there are five digits on the fore and hind feet, the terminal bones are cleft for the attachment of fairly large hoofs, the main ankle bone (astragalus) is more or less flattened. A single very small jaw, the genus *Arctostylops* of Matthew, found in the Lower Eocene of Wyoming, appears to be related to these South American Notioprogonia. Another apparently related type is found in the Eocene of Mongolia. These small jaws seem to increase the probability that the South American Notioprogonia, like other members of the notoungulate series, had been derived from some basal Eocene or Upper Cretaceous forerunners of the taligrades and condylarths of the northern world.

The *Astrapotheria*, gigantic Santa Cruzian (Lower Miocene) forms with long downwardly growing tusks, may be highly specialized derivatives of some early member of the Notoungulata.

Toxodontia (*q.v.*).—These were perhaps the most numerous in species of all the notoungulate series. One of the best known primitive toxodont is the Santa Cruzian (Lower Miocene) genus *Homalodontotherium*, a larger form in which all the teeth had become high-crowned and all the incisors, canines, premolars and molars were pressed together in a continuous series without break or interval. The Santa Cruzian (Lower Miocene) *Nesodon* was about the size of a rhinoceros but with the back curved and the limbs shorter. The front teeth were enlarged and flattened for cropping vegetation, the upper molar teeth had extremely long oblique outer walls and folded wearing surfaces. The three-toed feet, although rhinoceros-like in appearance, agreed with those of the litopterns in their fundamental characters. The Pampaean (Pleistocene) *Toxodon* was still larger, with a gigantic head and a huge curved back. This was one of the famous fossil South American mammals studied by C. Darwin (see *Voyage of the Beagle*).

Typotheria.—The smaller genera of this group, named protypotheres, included some that broadly resembled *Hyrax* and others that were rabbit-like. They were very abundant in the Lower Miocene of Patagonia. The extremely high-crowned molar teeth were much curved transversely, as in some rodents, and were adapted for grinding tough vegetation. The later form, *Typotherium*, from the Pampaean or Pleistocene of Argentina, had rodent-like incisors. It was about as large as a brown bear. This group is rather closely related to the toxodonts.

Pyrotheria.—In these curious animals the molars were bilophodont, that is they bore two cross-crests like those of tapirs and dinotheres. The skull in some ways resembled those of the Proboscidea (*q.v.*) and the same is true of the tusks, but on the whole it seems more likely that the pyrotheres are simply the South American analogues of the Proboscidea.

Hyracoidea (*q.v.*).—This characteristically African group is represented today by the "coneys" or dassies of southern and west Africa, Abyssinia, Arabia and Syria. These furry little animals have but slight external resemblance to ungulates but their jaws and teeth abound in resemblances to ungulates of many groups. The internal anatomy shows a curious mixture of resemblances to elephants and perissodactyls. There is no satisfactory evidence, however, of the relationship of *Hyrax* to any of the groups so far named. The hyracoids as a group must have been in Africa for many millions of years, since various forms of fossil hyracoids have been found in the Lower Oligocene of the Fayûm district in Egypt. In some of these very ancient hyracoids (*Megalohyrax*) the molar teeth recall those of Eocene titanotheres or of *Meniscotherium* among the condylarths. In its skull *Megalohyrax* was more or less swine-like.

Embrithopoda.—While the hyracoids played the part of the small ruminants in the ancient fauna of the Fayûm, the economic rôles of the rhinoceroses and elephants were assumed by gigantic beasts named *Arsinoitherium* (*q.v.*) in honour of an Egyptian queen. In these very strange animals the whole fore-part of the skull was surmounted by an enormous pair of bony horns, which in the front view rose to a great height. The folded surfaces of the molar teeth remotely recall those of the American Eocene amblypods, but the premolars rather suggest relationships with the hyracoids. The body was very massive and the skeleton shows a curious mingling of resemblances to elephants and amblypods, doubtless the results of similar adaptations to slow browsing movements and the support of the immense body weight. The existence of these highly specialized animals in Africa at such an early date as the Lower Oligocene and their apparent isolation, in spite of their adaptive resemblances to elephants and amblypods, all indicate a very long line of less and less specialized ancestors, traces of which may some day be discovered when still older fossil-bearing horizons are discovered elsewhere in Africa.

Barytherioidea.—Another strange type of extinct ungulate (named *Barytherium grave* by C. W. Andrews) was discovered in the Fayûm district of Egypt along with the fossil hyracoids, arsinotheres and ancestral elephants. The only parts of the animal found were a large lower jaw, a humerus and a radius, all of which show a curious mixture of resemblances on the one hand to the primitive proboscidean *Moeritherium* and on the other hand to *Dinoceras* of the Amblypoda. In a general way it also resembles the ancient South American *Pyrotherium*.

Proboscidea.—The evolution and structure of the elephants (*q.v.*) are considered in the article PROBOSCIDEA, and further information can be found in H. F. Osborn's *Monograph* of this group. As to the remote origin of the Proboscidea, the fact that *Arsinoitherium*, in spite of its wholly different skull and dentition, shows so many curiously detailed resemblances to the Proboscidea in its limbs and backbone, lends some support to a view that the Paenungulata, a superordinal group, consisting of the Proboscidea, Hyracoidea, Embrithopoda, Amblypoda, may after all be a more or less natural assemblage of ungulates. In fact we may even advance the tentative hypothesis that some such small Lower Eocene condylarth as *Hyopsodus wilcottanus* (described by Matthew and Granger), with short spreading feet, reduced canines, slightly procumbent incisors and bunodont molars, would have been an ideal starting-point for the entire subungulate series, including also the South American Pyrotheria and the Sirenia.

Sirenia (*q.v.*).—If "common sense" and superficial appearances were trustworthy, these surprisingly whale-like mammals would still be classified with the Cetacea (*q.v.*) as they were by all early naturalists. But De Blainville as far back as 1816 classified them as *"ongulogrades anomaux pour nager"*—anomalous ungulates adapted for swimming; in his later classification he brigaded them with the Proboscidea under the term "Gravigrades." Andrews in his description of *Eotheroides* (the oldest known sirenian, from the Upper Eocene of the Fayûm, Egypt) pointed out a number of significant features in which the skull of *Eotheroides* resembled that of *Moeritherium*, the oldest and most primitive known proboscidean from the same formation. He also cited a number of curious anatomical details in which even the modern Sirenia agree with the elephants in spite of the enormous difference in their external appearance and mode of life. On the other hand, R. Lydekker pointed out that the unworn molar teeth of certain extinct sirenians were curiously like those of certain extinct artiodactyls (*Merycopotamus*) and that this fact suggested the derivation of the Sirenia from very early Eocene artiodactyls; but one might equally say that the molar teeth of another extinct sirenian (*Miosiren*) suggest those of the Eocene rodent *Ischyromys* and that the order Sirenia had therefore been derived from primitive rodents. Either of these views would be hard, in the present meagre state of our knowledge of the subject, to disprove; but neither has nearly as much positive evidence in its favour as the view of De Blainville and Andrews that the Sirenia are an aquatic specialization from the Proboscidean stem.

Be that as it may, however, by the time of the Lower Oligocene *Eotheroides* was already definitely a sirenian in its dentition, skull and locomotor skeleton. Thereafter during the Oligocene, Miocene, Pliocene and Pleistocene epochs the changes in the skull and skeleton were comparatively slight and unimportant. The middle and late Tertiary sirenians (such as *Halitherium* and *Haliananassa*) were for the most part considerably larger than the modern manatees and dugongs (*qq.v.*) and had a large vertically-

placed pair of upper tusks, which have been retained by the dugongs but lost by the manatees.

The Sirenia are whale-like in their torpedo-like bodies and horizontal tail flukes, in the complete absence of external hind limbs and in their flipper-like forelimbs, which however still retain external nails or vestigial hoofs They differ markedly from typical cetaceans in their relatively small heads, truncate flattened snouts with transversely expanded upper lips covered with very large bristles The molar teeth are two-ridged,—wholly unlike the conical teeth of toothed cetaceans. Their tusks when present are situated at the end of the muzzle and directed downward They differ profoundly from cetaceans in their food and feeding habits, being the herbivores of the coasts and estuaries, whereas at least the typical cetaceans are essentially carnivores of the open seas. In their internal anatomy the sirenians likewise differ widely from cetaceans: the musculature of the forelimbs is less profoundly modified for aquatic life, the brain has a much less complexly convoluted surface and the digestive tract recalls that of the ruminants. The skeleton of sirenians is peculiarly massive and dense, the swollen, heavy ribs serving apparently as ballast to keep these voluminous, gas-filled bodies below the surface.

Most of the many known extinct types of sirenians conform in essentials to the dugong type, but one extinct family, the Miocene Desmostylidae, is widely different from the rest In these the large upper tusks almost suggest the earliest proboscidean types but the most remarkable peculiarity is found in the molar teeth, each of which consists of a closely packed cluster of cylindrical columns of circular cross-section.

Perissodactyla.—*See* PERISSODACTYLA.

Artiodactyla.—This order is chiefly dealt with in the article ARTIODACTYLA. Here it may be noted that attempts, as by Cope and others, to brigade the artiodactyls with the perissodactyls under the terms Taxeopoda or Ungulata Vera have in the long run only served to bring out the entirely artificial nature of such an assemblage and to throw into relief the significant differences which widely separated these two orders from each other as far back as Lower Eocene times There is indeed more to be said in favour of the view that the Artiodactyla may be an offshoot of some forerunner of the mesonychid family of the creodonts, while the Perissodactyla may be related remotely to the Cretaceous ancestors of the condylarths. Recent studies by Miss H. S. Pearson on the skull structure of the earliest artiodactyls have revealed that at a very early date the order was already subdivided into two series, one the amastoid series, in which the mastoid region of the periotic bone was completely covered by the squamosal and adjacent elements (as in the suines and their extinct relatives) and the other, or mastoid series, in which the mastoid was well exposed on the outer side, as in the Eocene Dichobunidae and all the ruminant artiodactyls.

In conclusion, much future palaeontologic exploration, in Africa, in Mongolia and many other parts of Asia, will doubtless be necessary before many of the problems touched upon in this article can be pushed forward nearer to solution.

UNICORN, a fabulous beast, usually having the head and body of a horse, the hind legs of an antelope, the tail of a lion (sometimes horse's tail), sometimes the beard of a goat, and as its chief feature a long, sharp, twisted horn, similar to the narwhal's tusk, set in the middle of its forehead (Lat. *Unicornis*, single-horned, Gr. *μονόκερως*). The earliest description is that of Ctesias, who (*Indica opera*, ed. Baehr, p. 254) states that there were in

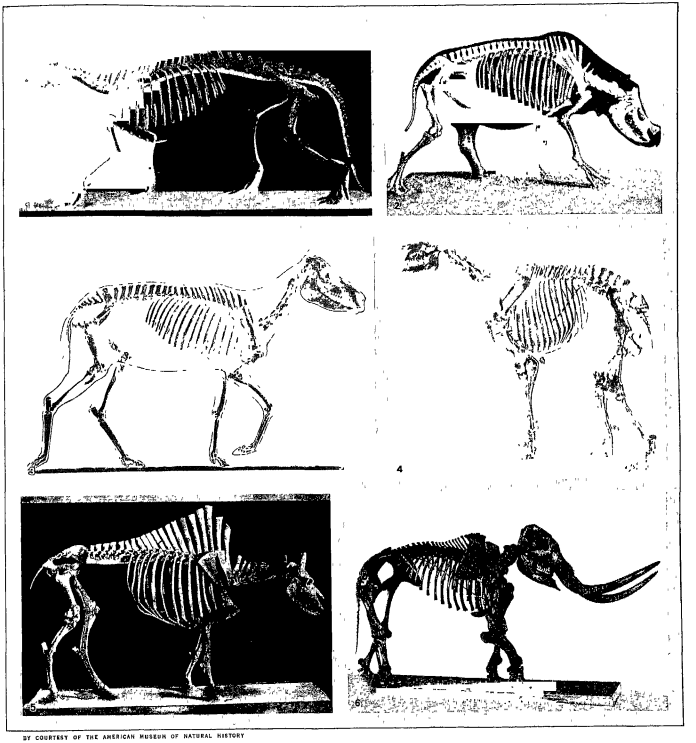
THE UNICORN OF LEGEND AND HERALDRY

The centre illustration shows the heraldic unicorn, and those on the left and right, the Chinese and Japanese varieties respectively

India white wild asses celebrated for their fleetness of foot, having on the forehead a horn a cubit and a half in length, coloured white, red and black; from the horn were made drinking cups which were a preventive of poisoning. Aristotle mentions (*Hist. anim.*, ii. 1; *De part. anim.*, iii. 2) two-horned animals, the oryx, a kind of antelope, and "the so-called Indian ass." In Roman times Pliny (*N.H.*, viii. 30; xi. 106) mentions the oryx, the Indian ass, and an Indian ox as one-horned; Aelian (*De nat. anim.*, iii. 41; iv. 52), quoting Ctesias, adds that India produces also a one-horned horse, and says (xvi. 20) that the *Monoceros* was sometimes called *Carcazonon*, possibly a form of the Arabic *Carcadān*, rhinoceros



The mediaeval conception of the unicorn as possessing great strength and fierceness is perhaps due to the fact that in certain passages of the Old Testament (*e.g.*, Num. xxiii. 22; Deut xxxiii. 17; Job xxxix. 9–10) the Hebrew word *R'ēm*, now translated in the Revised Version "wild ox," was translated in the Septuagint *μονόκερως*, in the Vulgate *unicornis* or *rhinoceros*, and in the Authorised Version "unicorn," though in Deut. xxxiii. 17 it obviously refers to a two-horned animal. Isidore xii. 2, 12 tells how the unicorn has been known to worst the elephant in combat.

As a decoration on drinking-cups it symbolized the ancient belief in the efficacy of the unicorn's horn against poison, which in England remained, even in the time of Charles II, though Sir E. Ray Lankester (*Science from an Easy Chair*, 1910, p. 127) mentions that a cup made of rhinoceros horn was then handed over to the Royal Society for experiment, with the result of entirely disproving the superstition. In the court ceremonial of France as late as 1789 instruments of "unicorn's" horn were still used for testing the royal food for poison.

In heraldry the unicorn was sometimes used as a device (*see* HERALDRY), but oftener as a supporter, and subsists to the present day as the left-hand supporter of the royal arms This position it assumed at the Union, the Scottish royal arms having been supported by two unicorns. When the unicorn became a supporter of the royal arms both of England and Scotland, a royal crown was added on the head of the unicorn, in addition to the crown with chain and ring round its neck (*see* Great Seal of James I. and VI. in Anderson, Pl. xciii.), but this crown was removed after the Hanoverian succession In England after the Union the unicorn became the left-hand supporter, but in Scotland, as late as 1766, it was still put on the right (Seton, p. 442).

EXTINCT MAMMALS OF TERTIARY AND QUATERNARY TIMES

1. Skeleton of Lower Eocene *Phenacodus primaevus*, believed to be a five-toed ancestor of the horse
2. Skeleton of Upper Oligocene *Diceratherium*, an extinct species of Rhinoceros
3. Skeleton of *Neohipparion whitneyi*, a horse of the Upper Miocene plains region of North America. The outline is restored
4. Skeleton of Lower Miocene *Moropus*. It stood about six feet high at the shoulders and resembled a large horse
5. Skeleton of *Bison occidentalis*, extinct North American mammal of the Quaternary period, inhabiting Kansas and Alaska Closest species to the existing bison
6. Pleistocene North American *Mastodon americanus*, forerunner of the elephant

coarse, sticky-hairy, half-prostrate annual, with thick, roundish leaves; large violet or purple flowers, ¾ in. long; and hanging, horn-like, woody pods, with a thick body, 3 in to 4 in. long, ending in a curved beak of equal or greater length When dry, the beak splits into two opposed hook-like or claw-like appendages.

UNIDIRECTIONAL RADIO DIRECTION FINDER, a radio device which permits determination of the direction (without 180 deg ambiguity) of waves as received from a transmitting station.

UNIFIED FIELD THEORY, a term widely applied, early in 1929, to represent the new theory which was then advanced by Dr Albert Einstein, according to which there is but a single background to all material activity—one unified field. A material object is commonly conceived of as existing in *space* and *time*. The scientist often adds that the object is in a *gravitational field* and in an *electro-magnetic field* These four terms seem to attribute four different backgrounds to the object But the special theory of relativity (*q v*) has amalgamated space and time into space-time and the general theory of relativity, with its Riemannian geometry, has absorbed the gravitational field into space-time Thus three of the four terms were already reduced to one. The unified field theory goes a step further by including the electro-magnetic field. A survey of Dr Einstein's announced solution of the problem of unification has been written by Professor A. S. Eddington and will be found at the end of Dr. Einstein's own article on SPACE-TIME in vol xxi , page 108.

UNIFORMS. The word "uniform" (Lat *unus*, one, and *forma*, form), meaning adjectively homogeneous, is specifically used as a substantive for the distinctive naval, military and air service dress, which serves, in its various styles, to give homogeneity to the several services, regiments and ranks Although in ancient history we occasionally meet with uniformed soldiers, such as those of Rome and the white and crimson Spanish regiments of Hannibal, it was not until the establishment of standing armies that uniforms were introduced in modern times. The absence of uniforms accounts very largely for the significance attached to the colours and standards, which alone formed rallying points. The beginnings of uniforms are therefore to be found in truly national armies, in the *Indelta* of Gustavus, and the English armies of the Great Rebellion In the earlier years of the latter, though the richer colonels uniformed their men (as, for instance, the marquess of Newcastle's "Whitecoats" and the king's own "Bluecoats"), the rustics and the citizens turned out for war in their ordinary rough clothes, donning armour and sword-belt. But in 1645 the parliament raised an army "all its own" for permanent service, and the colonels became officials rather than proprietors. The "new model" was clothed in the civilian costume of the date —ample coat, waistcoat, breeches, stockings and shoes (in the case of cavalry, boots)—but with the distinctive colour throughout the army of red and with regimental facings of various colours. The regiments were known as the Blue, Orange, Yellow, etc. Regiments—according to the colour of these facings. The breeches were grey Soon afterwards the helmet disappeared, and its place was taken by a grey broad-brimmed hat. From the coat was evolved the tunic of to-day, and the hat became the cocked hat of a later generation, which has never altogether disappeared, and has reverted to its original form in the familiar "slouch-hat "

For service in Ireland the red coat was exchanged for one of russet colour. The cavalry, however, wore buff leather coats and armour long after the infantry had abandoned them; the Austrians on account of their Turkish wars, retained them longer than any

Thus the principle ever since followed—uniform coat and variegated facings—was established. In France, as in England and Austria, the cavalry, as yet rather led by the wealthy classes than officered by the professional, was not uniformed upon an army system until after the infantry. But in 1688 six-sevenths of the French cavalry was uniformed in light grey with red facings; and about half the dragoon regiments had red uniforms and blue facings. Louvois, in creating a standing army, had introduced an infantry uniform as a necessary consequence. The native French regiments had light grey coats, the Swiss red, the German black and the Italian blue, with various facings.

The hat and the long coat and breeches remained the uniform of line infantry almost everywhere up to the advent of the shako and the coatee about 1790–1820. The gradual evolution of these two garments, from the comfortable civilian clothes of 1690 to the stiff, precise military garments of 1790, can be traced in a few words. The brim of the felt hat was first looped up on one side for convenience, then, for appearance' sake, on the other, and so became the three-cornered cocked hat, fringed with feathers, lace or braid, of Marlborough's wars Then came the fashion of looping up before and behind, which produced the hat called the "Khevenhuller," or the broadside-on cocked hat Lastly, came the purely decorative, lace-looped "fore-and-aft" pattern. Though the long skirts that rendered great coats unnecessary were looped back and the ample cuffs of Marlborough's time became narrower until they were at last sewn down to the sleeve, yet the military costume was in all essentials the civil costume of the time—long coat, hat, sleeved waistcoat, breeches and gaiters.

The introduction into armies of Slavonic irregulars, tended to restrict line infantry and cavalry to parade drill and to pitched battles in parade order. This stiffened their costume until it became "soldierly." The flapped cuffs became plain round cuffs, above which were embroidery stripes and buttons which at one time laced the flaps of the cuff together and now survive as the "guard-stripe." This may be called the first instance of the dummy adornments, which are so marked in modern full-dress uniforms. Similarly the former cloth turnback on the front of the coat was cut off, even in 1756, the buttons and embroidered loops that retained it being kept as decorations.

During the 18th century the cocked hat was by far the most common type. The grenadier cap was its first successful rival. This form of headdress grew out of the limp, conical fatigue caps of the irregular forces, and was adopted by grenadiers in the days when they actually hurled grenades. These caps lacked a brim and thus permitted a greater freedom in throwing. As grenadiers grew into picked companies of tall men, their caps were heightened to create an even more imposing effect. From these developed the towering bearskins of the British grenadiers, and the mitre-caps of the Russian and German guard corps. From this same beginning came a smaller cap, round and of jacked leather, with a plate in front This was worn by light troops, horse and foot, who were next in importance to the grenadiers.

The Hungarian hussars introduced the jacket and the busby. The latter was originally a conical cap with fur edge, but the fur became higher until there was nothing left of the cap but the ornamental "busby-bag" of today. The lancer cap, originally the Polish *czapka*, was a cylindrical cap with a square top, the upper part of which could be pushed up or down after the fashion of a bellows or accordion. The line infantry and cavalry coat, fulk-larted in the first instance, retained its original length until about 1780, but from that time onwards it became, little by little, shorter and scantier until at last it was a "coatee," not as long as the present-day tunic or a swallow-tailed coat. This did away with the protection afforded by the full skirt, and necessitated the introduction of the great coat. The white breeches and gaiters, retained to the last, gradually gave way to trousers and ankle boots in 1800–1820. About 1800 the shako was introduced, apparently from civilian origins. By the end of the Napoleonic wars it was almost universally worn by foot troops and by many other branches as well. Since then it has taken many forms, the latest of which is the modern peaked cap.

Another form of headdress came into vogue—the helmet, which had disappeared from the infantry about 1650–1670, and the cavalry thirty years afterwards. It took two forms, a small helmet with sausage-shaped ornament from front to back, worn chiefly by British light dragoons and artillery, and the towering crested helmet worn by the French, British and Austrians. The French cuirassiers and dragoons had long horsehair tails dependent from the crest.

At the beginning of the 19th century gaitered breeches were replaced by trousers and cavalry uniforms were increasing in brilliance. After Waterloo, indeed, all traces of the old-fashioned coat disappeared, and, the soldier was more showy and worse off in comfort and convenience than previously The hussar furred

pelisse, originally worn over a jacket, had become a magnificently embroidered and laced garment, always slung and never worn, and the old plain under-jacket had been loaded with buttons and lace and differed from the pelisse only in the absence of fur. British regulations of 1855 introduced the low "Albert" shako and the tunic, and abolished the epaulette.

The tunic, accompanied by a spiked helmet of burgonet shape, had been introduced in Prussia and Russia about 1835. The French adopted the tunic in 1853, the Austrians in 1856, and in both countries the shako became smaller and lighter. From about 1880, when the spiked helmet replaced the low shako in England, no radical changes were made in full dress uniforms, except that the Russian army, abandoning the German pattern uniforms formerly in vogue, adopted a national uniform. In 1906–09, however, this attempt to combine handsomeness and comfort was given up, full dresses being made more decorative and light green-grey service dresses being introduced.

The most significant development of this period was the introduction of the drab-coloured field uniform as distinct from other forms of dress. Bright clothing had been of decided moral value on the battlefield, and the limited range of older weapons rendered the extreme visibility of such dress of little consequence. The rapid development, however, of the more accurate, long-range magazine rifle, during the last quarter of the 19th century, placed a premium on low visibility and the need for "protective colouring" in the field.

During the Spanish-American War (1898) the United States adopted a cotton "khaki" uniform for some of its units serving in the tropics. This "dust coloured" cloth had been used in the Indian army for 50 yr.; other types of neutral clothing were of even greater antiquity. As a result of experience gained during the Boer War (1899–1902) a service dress of khaki serge was introduced in the British army about 1903. Experimentation was undertaken in other countries which led up to the issue of a greenish grey uniform in Sweden (1906), Turkey (1909), Germany (1910) and several other states about the same time. Italy had adopted a bluish grey field uniform in 1908 and Austria-Hungary a somewhat similar shade in 1912.

At the outbreak of World War I (1914–18) the issue of these field uniforms was general in all the belligerent nations except France and Belgium. Both hastened to repair this defect, and by 1915 the French army was garbed in a light or "horizon" blue and the Belgian forces were in British khaki. By this time the United States had adopted a darker and greener shade of brown called "olive drab." The exigencies of trench warfare necessitated looser, more comfortable clothing. Caps were softened, collars were lowered and enlarged and pockets became more plentiful. As a protection against shell fragments the combatant armies had by 1917 adopted the steel helmet for all branches. Various attempts were made to provide multi-coloured or "camouflage" clothing which would blend more readily with the landscape, but the results were not found to be worth the cost and effort except in special instances.

Needless to say, dress uniforms were set aside during the period of hostilities and for some years thereafter. In time, however, the need for more inspiriting apparel made itself felt and was solved by various countries in two general ways. The first and most general method was to enliven the field uniform by the addition, in times of peace, of coloured patches, bright metal parts and special insignia which could be removed for field service. The second method entailed the adoption of a very plain and serviceable field uniform and one or more dress kits which were worn off duty or on parade. The German and American armies tried the first method, the British the second and the French adopted somewhat of a compromise between the two. No state returned in the entirety to its 1914 dress uniforms.

Several general trends may be observed in uniform development from 1918 to 1940. To accustom soldiers to the weight and employment of the steel helmet and gas mask, most armies required them worn during all field exercises. The shirt gained popularity as an outer garment in warmer weather, and trousers continued to become longer and more full. Distinctive uniforms were widely adopted for tank, motorized and air units, parachute troops and other special services. Details of the uniforms worn in the principal states at the beginning of 1940 are given in the sections below. (F. P. T.)

Party Uniforms.—A dress of a particular style has often been used to distinguish members of political parties. Sometimes it was merely an armband; in other cases (for instance, when certain insignia were prohibited) civilian clothes, from tie to tophat, had to serve this purpose. The most popular political uniform was probably the shirt. Red Shirts were worn by the volunteers who followed Giuseppe Garibaldi (*q.v.*) and later members of the family. The legions of Gabriele d'Annunzio (*q.v.*) and those of Benito Mussolini (*q.v.*) adopted the Black Shirt, which was also selected by the leader of British fascists, Oswald Mosley (*q.v.*). American fascists wore Silver Shirts, fascists in the Irish Free State and in the Philippines had Blue Shirts, while Gray Shirts were to be found in Cuba and Green Shirts in Brazil. Because of this garment veterans of Latin-American fascism were called "Old Shirts." The best-known political uniform is perhaps that of the Brown Shirts. In 1924 the Brown Shirt was first introduced by the Munich S.A. (*Sturm Abteilung*). Later it was taken over by all S.A and S.S. (*Schutz Staffel*) men and the political leaders of the National Socialist party. Brown Shirts then became the general term for the adherents of the National Socialist movement (*See* NATIONAL SOCIALISM (X)).

GREAT BRITAIN

General Service Uniforms.—The British Army wore the khaki service uniform issued about 1903. The coat was single-breasted, had four outer pockets, a high collar for men and peak lapels for officers. With this was worn a peaked khaki cap, long trousers for foot units and breeches for mounted corps. The khaki overcoat was single-breasted.

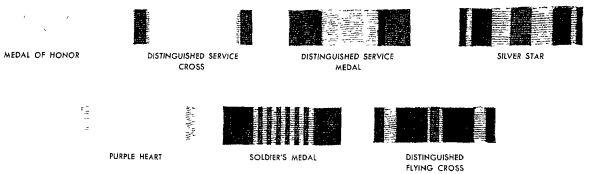
Special Service Uniforms.—Tank units wore black overalls and berets. Scottish regiments continued to wear their traditional tartan kilts with a special cut of khaki coat, while units of the Indian Army and other Empire troops introduced many variations into the service uniform. In tropical service cotton shirts and shorts were worn with sun helmets.

In 1938 a drab-coloured "battle dress" was introduced for all combat units. It consisted of a short jacket with a wide collar and two full pockets; long, full trousers with large pockets over the thighs, and short gaiters. A simple fatigue cap or the 1916 pattern steel helmet was worn with this kit, together with web equipment of a new design.

Dress Uniforms.—In 1921 the traditional scarlet or blue dress uniforms were reintroduced for Household troops and regimental bands. Officers were permitted to wear special dress and mess kits. In 1937 a dark blue walking-out dress was issued for enlisted men of all arms, consisting of a single-breasted coat with four outer pockets, long trousers and a peaked cap. Minor modifications in hat and trousers and variations in trimming were permitted.

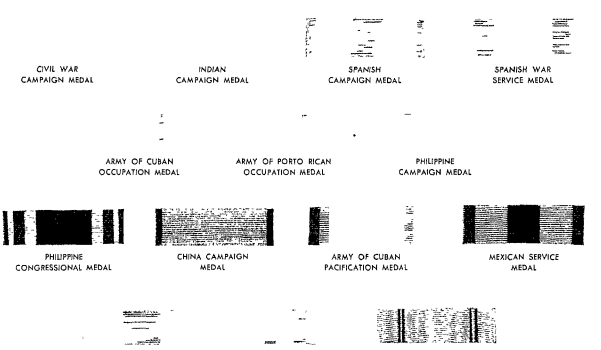
Insignia.—Regimental and branch distinctions were indicated by means of metal badges bearing traditional coats-of-arms and by numerous minor variations throughout the different uniforms. Rank was shown for officers by metal devices on the shoulder strap, for enlisted men by chevrons and other insignia on the sleeve.

UNITED STATES OF AMERICA



General Service Uniforms.—The service uniform for all branches and components of the Army was olive drab in colour, wool for winter and cotton for summer. The coat was single-breasted, with four outer pockets and a peak lapel collar for all ranks. Trousers of a slightly lighter shade were issued to foot troops, and were tucked into laced canvas leggings, while breeches and laced leather boots were worn by mounted units. Breeches and trousers for officers were of a definitely lighter shade than the coat. An olive drab shirt and black tie were worn under the woollen coat. Usually the cotton uniform did not include a coat, the shirt being worn with a tie of similar colour.

A peaked service or "barracks" cap was worn for walking-out or formal parades by all branches, that of the officer being of a slightly different design and of better material. For field service all branches except the Air Corps, tank and mechanized cavalry units wore a full-brimmed hat with the crown shaped by four indentations (called the "Montana Peak"). The other units used a fatigue or "overseas" cap. All branches and ranks wore the steel helmet of World War (1917) pattern. All forms of headdress were olive drab in colour.

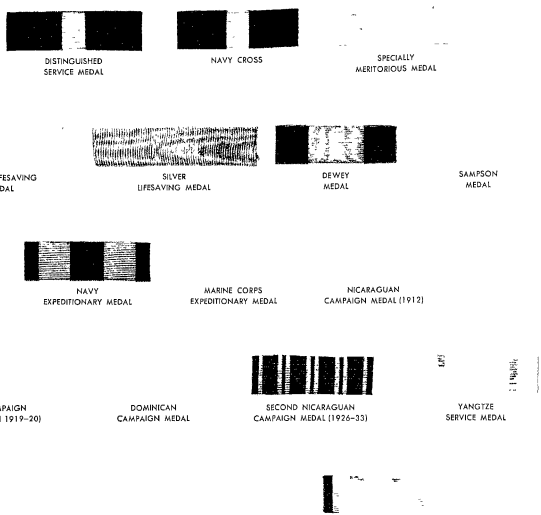


Special Service Uniforms.—Cadets of the Military Academy wore a special service uniform of "cadet grey," consisting of a shirt, breeches and service hat. Flying cadets were issued a slate-blue uniform of the same general pattern as the Army, single-breasted coat or shirt, trousers and "overseas" cap.

Dress Uniforms.—The blue and white dress uniforms of 1917 were not reissued to enlisted men. While the blue uniform was worn later by a few officers on special occasions, the officer's white dress uniform and white mess jacket were used frequently in warm weather. The former consisted of a single-breasted linen or cotton coat with four outer pockets and a peak lapel collar, white shirt and black tie, white trousers and a white peaked cap of regular pattern.

DECORATIONS

SERVICE RIBBONS



LOFMAN PIX

U.S. ARMY DECORATION AND SERVICE RIBBONS

DECORATIONS IN ORDER OF PRECEDENCE.—(First row) *Medal of Honor* For conspicuous gallantry and intrepidity at the risk of life, above and beyond the call of duty, in action involving actual conflict with an enemy, while an officer or enlisted man *Distinguished Service Cross* For extraordinary heroism in connection with military operations against an armed enemy. *Distinguished Service Medal* For exceptionally meritorious service in a duty of great responsibility. *Silver Star* For gallantry in action in situations not warranting the award of either the Medal of Honor or the Distinguished Service Cross. (Second row) *Purple Heart* For singularly meritorious service or extraordinary fidelity, and for wounds received in battle *Soldier's Medal* For heroism not involving actual conflict with an enemy *Distinguished Flying Cross* For heroism or extraordinary achievement in aerial flights. SERVICE RIBBONS.—(Third row) *Civil War Campaign Medal*, 1861–66. *Indian Campaign Medal*, 1865–91 *Spanish Campaign Medal*· Cuba, Porto (Puerto) Rico, Philippines, 1898 *Spanish War Service Medal*, 1898–99, to those not eligible for Spanish Campaign Medal (Fourth row) *Army of Cuban Occupation Medal*, 1898–1902. *Army of Porto Rican Occupation Medal*, 1898. *Philippine Campaign Medal*, 1899–1913. (Fifth row) *Philippine Congressional Medal* For serving beyond date of normal discharge from Spanish-American War service. *China Campaign Medal* Relief expedition to Peking, 1900–01. *Army of Cuban Pacification Medal*, 1906–09. *Mexican Service Medal* Mexican border and in Mexico, 1914–19. (Sixth row) *Mexican Border Service Medal*· Mexican Border Patrol, 1916–17. *Victory Medal* World War I, 1917–18; Siberia and European Russia subsequent to Nov. 11, 1918 *Defense Service Ribbon*: Awarded to all service men of World War II on active duty in the armed services prior to Dec 7, 1941

UNIFORMS

UNIFORMS OF THE 19TH AND 20TH CENTURIES

Franco-Prussian War: French infantry; Prussian infantry. *Spanish-American War*: Spanish regular infantry, U.S. infantry. *World War I* (infantry): German, 1916–18; U.S., 1917–18, French, 1916–18; British, 1916–18; Italian, 1916–18. *World War II* (infantry): Polish, Italian, Russian, Finnish, German, Japanese, U.S., British

Enlisted men off duty or on parade were permitted a white shirt under the coat. The use of bright metal buttons and colourful insignia was permitted in peace times, which rendered the general service uniform suitable for dress purposes. Special dress uniforms were worn by some bands, cadets of the Military Academy, and many units of the National Guard.

Insignia.—Branch was indicated by various coloured cords on the service hat, piping on the "overseas" cap, and metal devices on the collar or lapel. Unit designations were also shown on these metal devices, as well as by special unit coats-of-arms, worn on the hat, lapels or shoulder straps. Division, corps or army patches were sewn to the upper left sleeve of the coat and overcoat. Rank was indicated by metal devices on the shoulder strap for commissioned officers, and by chevrons on both sleeves for non-commissioned officers. Specialist insignia and service stripes were worn on the arm of the coat and overcoat.

FRANCE

General Service Uniforms.—Since 1935 both the Metropolitan and Colonial Armies have worn khaki. The drill or fatigue dress consisted of a shirt, breeches, roll puttees and a wide sash of various colours. A short, single-breasted coat with wide collar was added to make the walking-out dress. The traditional overcoat, looped back for marching, was worn for field service. Mounted troops wore leather gaiters over the infantry ankle boot instead of puttees; motorized and tank units used long trousers, strapped under the instep, as their only leg covering.

A khaki-coloured steel helmet, quite similar to the World War (1915) model, was worn by most arms. Anti-aircraft and motorized units were issued more compact types, both lacking a front visor. For undress most arms wore the round *kepi*, or peaked cap, of dark or light blue. Fortress and tank units wore a beret, and African units, different forms of the fez or turban. Most arms used a simple cloth cap (*bonnet de police*) for fatigue wear.

Special Service Uniforms.—The *Chasseurs Alpins* and *Chasseurs à Pied* retained their traditional dark blue uniforms and berets. When operating in the snow, the former were equipped with a white outer garment. African units wore the full oriental trousers of khaki colour in place of breeches; while troops of the Colonial Army, serving in the tropics, were outfitted in cotton khaki shirts, shorts and sun helmets.

Dress Uniforms.—All African units continued to wear their traditional dress uniforms of various colours when off duty as late as 1939. Regiments of the Foreign Legion retained the blue sash, red epaulettes, and green trimmings on their khaki clothing. Officers of different branches presented a wide variety of dress clothing: combinations of dark and light blue, red, black and khaki, with a white uniform for tropical wear. Special dress uniforms were provided for military schools and units of the *Garde Republicaine*.

Insignia.—Branch was indicated by various coloured collar patches, hat devices, buttons and other means. Unit numbers were shown on the collar patches and *kepis*. Rank was indicated on the sleeve and hat by stars for general officers and by horizontal stripes for other commissioned grades; for non-commissioned rank, by chevrons and slanting stripes on the sleeve. Many specialist insignias were worn on the coat, and honours were designated by ribbons and *fourragères*.

GERMANY

General Service Uniforms.—The general uniform was derived from the field service dress of 1910, modified by subsequent experience. The coat was of a green-grey colour, single-breasted, with four outer pockets and a wide collar which could be worn open at the neck. The trousers were of a somewhat greyer shade, loose, and fitting into high leather boots, laced in front and buckled on the side. The steel helmet was still chiefly the pattern introduced in 1916, painted green-grey and weighing 2½ pounds, although a lighter form was adopted about 1925. In walking-out order a peaked cap was worn, while a soft cloth cap (*Feldmütze*) was employed for fatigues and drills. The overcoat was of green-grey cloth.

Special Service Uniforms.—Tank units wore a distinctive black uniform with rose-coloured trimmings and white death's-head insignia. The jacket was short, double-breasted, with open collar; the trousers, full and long, were strapped around high shoes. A black beret or leather crash-helmet was used for head-dress.

Dress and Special Uniforms.—Officers and some non-commissioned ranks wore a single-breasted, pocketless tunic for undress (*Gesellschaftsanzug*), with long trousers or riding breeches and high black boots With this uniform, in some orders, a dress belt of metal lace was worn. Officers when off duty in summer were allowed a white coat with a peak lapel collar.

Permanent units of the National Militia wore uniforms of the same general cut as the infantry, only of black for *Schutz-Staffeln* and brown for *Sturm-Abteilungen*.

Insignia.—Branch was indicated by various coloured piping and patches on the collar, shoulder strap and cap. Unit numbers were found on the shoulder strap, and rank was indicated by piping or patches on the collar and by the design and markings of the shoulder strap Various specialist insignias appeared on the arm, and ratings in marksmanship were indicated by short *aiguillettes*.

On the right side of the steel helmet was a seal bearing the German colours and on the left another having the army eagle and swastika. All ranks wore the German eagle and swastika emblem (*Hoheitszeichen*) over the right breast and on the peaked cap.

POLAND

During the 1920s the Polish Army adopted a universal pattern uniform of khaki, for both dress and field service. The coat was single-breasted, with upright collar and with four outer pockets for officers and two for men On each side of the collar opening was a patch of coloured cloth varying with the arm. Trousers or breeches were of plain khaki serge or cord. General officers wore a double dark blue stripe down both breeches and trousers. A modified form of the national headdress or *czapka*, was adopted and made into the headgear for all ranks of the Polish Army. A band of coloured cloth, varying with the regiment, was worn round the cap, on the front of which appeared the badge of rank. A fatigue cap was worn by mounted units. The usual steel helmet was of French pattern, although a deeper model was adopted about 1936. The soldier's greatcoat was of khaki cloth, single-breasted, with broad collar, belt and shoulder straps. The officer's was similar to the double-breasted British pattern.

BELGIUM

The Belgian Army was clothed in khaki for general service, of a pattern similar to the British. Officers' coats had peak lapels, those of the men, high collars. A peaked cap generally was worn by officers, a dark blue beret by *jagers* and *carabiniers*, and a tasselled fatigue cap by other arms. All troops used a steel helmet of French model, with a lion's-head device. Air corps officers wore a blue-grey undress uniform of standard cut, and in 1930 a dark blue dress uniform was authorized for all officers.

THE NETHERLANDS

The general service uniform of the Dutch Army was of green-grey, consisting of a single-breasted coat and fatigue cap, with roll puttees and full trousers for foot troops, and breeches and black leather leggings for mounted units. The overcoat was double-breasted The steel helmet was of a distinctive pattern resembling that of the Swiss Army, carrying on its front the royal arms.

SWITZERLAND

In 1917, a green-grey field uniform was adopted for all arms, and shortly thereafter a distinctive type of steel helmet was issued, being high-crowned and coming low over the ears and brow. At first the different arms were distinguished by coloured tabs on the collar and cuffs, pipings, etc., but these were omitted on the later field uniforms. Officers wore a peaked cap of distinctive design, high and full at the back of the head. Men used two gen-

eral forms of fatigue cap, both buttoned in front. Foot troops wore long trousers and high shoes; mounted units wore breeches

YUGOSLAVIA

The Yugoslavian Army retained essentially the same service uniform as that adopted in 1912 It was light khaki in colour; the coat was cut somewhat on the old Austrian pattern with concealed buttons Breeches were full, and both foot and mounted troops wore high black boots. Infantry were also issued roll puttees Enlisted men wore a soft fatigue cap, while officers used a stiffer type with a visor. The French steel helmet was worn by all arms Special dress uniforms were provided for Household units, whose officers were allowed a distinctive undress uniform.

RUMANIA

The general service uniform was khaki in colour, the coat having peak lapels for officers and a standing collar for men. A peaked cap was introduced in 1931, but the distinctive Rumanian fatigue cap, high in the front and rear, was retained in many units A new steel helmet on the Swiss pattern gradually replaced the older French type. Special dress uniforms of traditional pattern were allowed Household troops and other officers. Chasseurs wore a distinctive "hunter's" hat, and in winter units were issued fur caps and long overcoats.

JAPAN

The general service uniform was of khaki, of a darker and greener shade for officers. The coat was single-breasted with a high collar, the breeches were full and buttoned below the knee. Roll puttees were worn by foot troops, leather leggings by mounted units. The soft cloth cap had a visor, but no fullness in the crown The steel helmet was similar to the British pattern, only deeper. Branch was indicated by coloured patches on the collar In summer the uniform was cotton drill; in winter it was wool, usually supplemented by armless, fleece-lined jackets and by helmet covers having fur ear tabs.

CHINA

Since the Revolution of 1912 numerous styles and colours of uniforms have been worn by the troops of the different Chinese states, blue-grey and khaki being the predominant shades. Troops in the south usually wore cheap cotton clothing, whereas those in colder regions used heavily padded uniforms and fur-lined hats. Due to the shortage of clothing in the 1930s, most of the Chinese armies adopted a simple blue denim coat, breeches, plain round cap and blue roll puttees. Southern troops frequently carried wide straw hats suspended over their backs. All enlisted men wore a tag sewn to the breast giving their name, rank and organization. Nationalist officers wore olive drab in the field and black uniforms for dress.

SPAIN

About 1927 a universal general service uniform of an olive drab shade was adopted. The coat was single-breasted or double-breasted, the breeches were full and worn with roll puttees or boots The usual hat was a beret, with a peaked cap or tasselled fatigue cap for officers and some services. During the Civil War (1936–39) a steel helmet of German pattern, only smaller, was introduced The Moorish body guards wore wide white trousers, white turbans and capes By 1939 dress uniforms had been reissued to certain mounted units.

ITALY

General Service Uniforms.—The standard uniform colour for all arms was grey of a somewhat bluer shade than that of Germany. The woollen coat was single-breasted with four outer pockets and peak lapels for all ranks; the breeches were full Foot troops wore roll puttees, while mounted units and most officers had high black boots. The steel helmet was of distinctive design, fitting low over the head, while a stiff peaked cap was worn for dress and a special cloth cap for fatigue. In warm weather a grey cotton drill was used, often in the form of shorts and shirt. Shirts were grey and neckties were of various colours.

Special Service Uniforms.—*Bersaglieri* cyclists retained their traditional wide-brimmed hat with cock's feathers, or, in the field, wore these feathers on the helmet. Mountain units also wore their older type Alpine caps Native *askari* troops were issued high red fezzes with blue tassels and red sashes.

Troops of the Fascist Militia were issued uniforms like those of the Regular Army, but with numerous minor variations in design Shirts were black, as were certain forms of their fatigue caps. Mounted men wore grey double-breasted overcoats and dismounted, large grey capes (*mantellina*)

Dress Uniforms.—A few special units retained traditional dress uniforms and traces thereof existed elsewhere in the form of sashes, epaulettes and distinctive headdresses In tropical service, a white uniform was permitted officers Dark blue dress coats, overcoats and wide-crowned, peaked caps were worn by Fascist officers of higher rank.

Insignia.—Branch and organization were shown by coloured collar tabs and hat devices. Rank was indicated by devices on the shoulder straps, sleeves and sometimes on the cap When in command of troops higher officers wore an aigrette on the hat.

UNION OF SOCIALIST SOVIET REPUBLICS

General Service Uniforms.—The Soviet Army wore a uniform of varying shades of olive drab. The winter dress of wool comprised a single-breasted coat with two outer pockets, breeches and high black boots, and a very long, double-breasted overcoat In summer a loose cotton blouse of Russian cut and cotton breeches replaced the wool. Most troops wore a peaked cap, although it was replaced in some branches by a simple fatigue cap for summer or by a distinctive cloth helmet with ear flaps, of Tartar origin, for winter. The steel helmet was of French pattern, although in 1937 a new type was issued somewhat similar to that used by Switzerland

Special Service Uniforms.—Tank units wore blue-grey blouses and caps with olive drab breeches Cossack units were permitted black astrakhan caps and full, dark blue trousers. The units of the Political Department (G P.U.) wore the regular uniform with a blue peaked cap, piped with red.

Insignia.—All arms and ranks wore the Soviet five-pointed star on their headdress. Branch was indicated by the colour of collar patches and cap piping, while rank was shown by devices on the lower part of both sleeves. Metal specialist insignia was carried on the collar

AIR FORCES

France.—In 1934–35 a distinctive uniform was authorized for the Air Corps It consisted of a dark blue, belted coat with four outer pockets, dark blue, long trousers and peaked cap, similar to that worn in the Navy A cotton uniform of khaki colour was prescribed for wear in the tropics, where officers were also permitted white uniforms off duty.

Germany.—The uniform was blue-grey in colour, the coat single-breasted with four outer pockets and peak lapel. An undress uniform was provided, consisting of a short buttonless jacket and fatigue cap. The uniform, otherwise, was essentially the same as that of the Army, save for colour For walking-out in summer officers were authorized to wear a white dress coat

Parachute troops used in the field green-grey overalls of special design, fastened by zippers, with deep bomb pockets let into the full trousers The shoes were high and had rubber soles These troops wore a helmet without front or rear visors

Great Britain.—The service uniform of the Royal Air Force was light blue, the coat being single-breasted and belted with four outer pockets. Breeches and roll puttees were worn, with a peaked cap for dress and a fatigue cap for ordinary wear. For foreign service all ranks wore a khaki drill uniform including a Wolseley helmet on which was worn a "flash" bearing in silk the R.A.F. colours.

A full dress uniform was allowed officers, made of light blue material, the coat single-breasted with plain cuffs and trimmed with gold lace The headdress, of distinctive design, was of black chrome leather, trimmed with seal dyed nutria, and had a gold

and blue plaited cord across the front and an ostrich feather plume dyed blue Officers were also permitted a mess dress of the same light blue colour, and white uniforms were authorized for tropical wear.

Italy.—The uniform was similar in colour to that worn by the Army, having a peak lapel coat, belted at the waist, and long trousers. A peaked cap was worn for dress, and a white uniform was permitted in warm weather

Japan.—As part of the Army the air service wore the universal khaki uniform with distinctive badges Aviation pilots wore, on the right breast, an oval device of wings, propeller and sun's rays; members of aviation battalions wore a propeller across a steering wheel in the form of a gilt badge on the right collar patch, the number of the battalion being on the left patch.

Poland.—As part of the Army the members of the aviation arm wore the universal khaki uniform with yellow collar patches

Rumania.—The air corps wore a khaki uniform similar in cut to that worn by the Army, with a peaked cap. White uniforms were permitted in summer.

Switzerland.—The flying corps wore the universal grey-green uniform with two wings and a propeller in light-brown thread as a distinguishing badge.

Union of Socialist Soviet Republics.—The 'Russian Air Corps wore an undress uniform of dark blue, consisting of a coat with four outer pockets and peak lapels, breeches and high black boots, and a fatigue cap. Parachute units were equipped with grey overalls and flying helmets, and rubber soled shoes

United States of America.—The Army air service being an integral part of the Army, the members wore the uniform laid down for the Army with particular distinctions Aviators and observers wore a pair of wings and a vertical propeller in silver on the left breast; enlisted men wore the same on the sleeve; flying instructors a pair of wings only. Flying cadets wore a slate blue dress

Yugoslavia.—As part of the Army the air service wore the universal olive-yellow service dress with horizon blue collar patches. (F P. T.)

NAVAL

Great Britain.—The dress of seafarers in the British Isles had attained a certain uniformity, principally brought about by the conditions and hazards of their calling, long before any regulations were made on the subject. Chaucer's description of the attire of the Shipman depicts a figure he had doubtless seen many times at Dartmouth, or in the streets of London in the neighbourhood of Bankside and the Pool. A sea gown of "falding," reaching to the knee, a homely garment of rusty blue or brown, intended to stand hard usage, was long worn by seamen In a book on costume by Caesare Vecellio, published in Venice in 1598, a full-length figure of an English mariner is shown, and the legend states that they wore short coats, sky blue, white or some other colour, wide baggy breeches with many folds, and ruffs round their necks. Their caps were hairy, like those that pilgrims wore. Such expressions as a "sea gown," a "pitch'd jacket," and a "canvas shrowd," as synonyms for sailors' wear, are common in Tudor and Stuart literature.

An important step leading to uniformity in the dress of the seaman was taken in 1628, when an order for the provision of ready-made clothing was given. Certain articles of attire were placed on board his Majesty's ships and hired vessels for issue to the officers and men, the cost to be charged against their wages. In 1638, an order for the prevention of over-charging was hung up in the steerage of every ship, and a list of the articles to be sold, with their prices. In 1663, the slop clothing included canvas suits, red caps, blue shirts, red or striped breeches and blue neck-cloths, among the articles for sale. From 1706 until about 1750, the slop clothing consisted of grey kersey jackets, waistcoats of striped ticking or Welsh red, breeches of red kersey or striped shag, blue and white check shirts, grey stockings, shoes and leather caps, faced with red cotton, or flat-topped three-cornered hats.

From the middle of the 18th century, when blue and white became the colours of the officers' uniform, the dress of the seamen gradually conformed to the same combination. It comprised usually a blue jacket, a scarlet or buff waistcoat, a check or striped shirt, white or striped trousers "long in the legs and taut at the hips and ankles," a kerchief, black or brightly coloured, tied loosely round the neck with two corners hanging down outside the jacket behind to protect it from the chafe of the pigtail, the vogue of which was only from about 1780 to 1830. The round hat was made of straw, leather or tarred canvas, turned up at the sides with a coloured lining, and a ribbon with the name of the ship painted on it The strips of canvas sometimes sewn on the seams of the jacket were only to repair and strengthen old and used garments, as Jonas Hanway wrote in 1759, and not as ornamentation After the first quarter of the 19th century, nearly all colours except blue had disappeared for all articles but waistcoats and kerchiefs.

In 1787, a uniform for all officers was established, and remained in force until 1795, when, to commemorate Lord Howe's victory of June 1, 1794, gold epaulettes hanging down like tassels, with marks on them to indicate rank, were introduced At the same time, the white facings were abolished, with one exception, the patch on the midshipman's collar. Nearly all the later portraits of Nelson and those of his band of brothers are in the full or undress of these regulations. In 1812, white facings were reintroduced, and this dress was worn during the War with the United States. New regulations were issued on January 1, 1825, with plans, which may be seen in the Admiralty Library. Since this date, regulations have been published in the Navy List, where the changes to the present time may be traced The most important was made by William IV, who in 1832 altered the facings from white to red, and so they remained until June 30, 1843. Queen Victoria then restored white, and so it has remained ever since Illustrated manuals of current naval uniforms were published by the Admiralty on May 7, 1879, and October 10, 1891.

Locker, *Journal of the Society of Antiquaries* (March, 1830); John Barrow, *Journal of the Archaeological Association* (April, 1846); *The Nautical Magazine*, page 140 *et seq* (March, 1846); *Memorandum* compiled by F H Miller (1884); Uniform Regulations for the Fleet, 1825, 1879 and 1891, *Illustrated London News* (May 16, 1891); C N Robinson, *The British Fleet* (1894). *The Royal Navy* (1907), and *The British Tar in Fact and Fiction* (1909); Articles in *The Mariner's Mirror* (1911 *et seq*); Quarterly Official *Navy List* (1813 *et seq*); Lecture by Commander R N Suter, *Journal of the Royal United Service Institution* (November, 1921). Orders in Council published from time to time in the *London Gazette*, Admiralty Regulations and Instructions, Captains' Order Books (Admiralty Library and Public Record Office).

Other Countries.—The development of naval dress in other states has, to a great extent, followed that of Great Britain. As a result, there was little difference between the naval uniforms of the various modern countries Almost all of them authorized blue kits for winter and white for summer or tropical wear, as well as various overgarments for combat or rough weather Only in the seamen's caps was any marked difference to be found. American sailors wore a distinctive white "shell" cap. French sailors carried a red pom-pon on top of their hats, and German seamen a long trailing ribbon German naval officers could be distinguished by the peak lapels and high wing collars worn with most uniforms, and the seamen by a jacket which replaced the blouse for dress. Japanese officers retained the older, high-collared uniforms. (X)

United States.—The uniform, with its various insignia and devices, is designed primarily to indicate on sight those men belonging to the naval service, to show at a glance their rank, corps, or rating, and is required to be worn at all times by officers and enlisted men while on duty.

The United States naval officers' uniform in general corresponds to those worn by officers of the various navies of the world, and officers of different ranks are most readily distinguished by the sleeve markings, or sleeve stripes of gold lace which completely encircle the sleeve In addition to these insignia of rank, officers of the several corps and warrants are indicated by individual corps devices embroidered above the sleeve stripes. Sleeve markings (stripes) for the various ranks follow:

Admiral .	One 2-inch stripe with three ½-inch stripes above it.
Vice-Admiral	One 2-inch stripe with two ½-inch stripes above it.
Rear-Admiral	One 2-inch stripe with one ½-inch stripe above it.
Captain . .	Four ½-inch stripes.

Commander	Three ½-inch stripes.
Lieut. Com.	Two ½-inch stripes with one ¼-inch stripe between the other two.
Lieutenant	Two ½-inch stripes.
Lieut.(jr. grade)	One ½-inch stripe with one ¼-inch stripe above it.
Ensign	One ½-inch stripe.
Chief warrant officer	One ½-inch stripe (the gold lace to be woven at intervals of 2 inches with dark-blue silk thread in widths of ½-inch.
Warrant officer	One ½-inch stripe (the gold lace to be woven at intervals of 2 inches with dark-blue silk thread in widths of ½-inch.

Sleeve markings (corps devices) of the commissioned grades and line warrants are listed as follows.

Line officers	Five-pointed gold star.
Medical officers	A spread oak leaf, embroidered in gold, surcharged with acorn, embroidered in sliver.
Supply officers	A sprig of three oak leaves and three acorns.
Chaplains	A Latin cross.
Naval constructors	A sprig of two live-oak leaves, spreading with an acron on the stem between the leaves.
Civil engineers	Two sprigs of two live-oak leaves embroidered in gold and an acorn embroidered in silver in each sprig.
Chief boatswain and boatswain	Two crossed foul anchors.
Chief gunner and gunner	Flaming spherical gold shell.
Chief machinist and machinist	A three-bladed gold propeller.

Uniforms worn by enlisted men of the United States navy consist in general of the conventional seaman's overshirt or jumper, with trousers that flare slightly at the bottom. The various enlisted ratings are indicated by rating badges worn on the sleeve midway between shoulder and elbow, consisting of an eagle, chevrons, and speciality marks. The chevrons indicate the rank or class of the petty or non-commissioned officer, while the speciality marks indicate, as the name implies, the branch in which the individual has been rated. Enlisted men, other than petty officers, wear what is known as a branch mark, consisting of a stripe of braid, white for the seaman branch and red for the engineer branch.

Detailed description, accompanied by photographic plates of the various naval uniforms of the United States may be found in a publication known as the *Uniform Regulations, United States Navy*, issued to members of the naval service and sold by the government printing office, Washington, D.C. (R. H. Le.)

UNION, a town of South Carolina, U.S., the county seat of Union county; 65 mi. N.W. of Columbia, on federal highway 176, and served by the Buffalo, Union-Carolina and the Southern railways. The population was 9,730 in 1950 and 8,478 in 1940 by the federal census.

It is in the beautiful Piedmont region, near the foot of the Blue Ridge, and is one of the important textile-manufacturing centres of the state, with large cotton mills.

UNION CITY, a city of Hudson county, New Jersey, U.S., 1 mi. W. of the Hudson river, opposite New York city, on high ground above Weehawken, between Hoboken and West New York. Railroad facilities are provided through Hoboken, Weehawken and Jersey City.

Pop. (1950) 55,537; (1940) 56,173. Manufactures include silk, cosmetics, paper and incandescent light bulbs.

Union City was formed in 1925 by the consolidation of Town of Union (incorporated 1864) and West Hoboken (incorporated as a town in 1884), which in 1920 had populations of 20,651 and 40,074 respectively.

UNIONIST PARTY: *see* CONSERVATIVE PARTY, BRITISH.

UNION LEAGUE OF AMERICA, THE, sometimes called the Loyal league, was an organization for political purposes of northern whites, later of southern Negroes, which originated in Ohio in 1862 when the Confederate military successes and political disaffection in the northern states made the outlook for the north seem doubtful. Within one year it had spread over 18 northern states and among the Unionists of the south. The order raised troops, paid their expenses, sent supplies to the field and distributed political literature. At the close of the war it worked for radical reconstruction of the southern states, punishment of the southern leaders, confiscation of property and Negro suffrage. The southern Unionists hoped to make it the nucleus of a new political party, but this was frustrated by the admission of the blacks for political purposes, after which the southern whites generally deserted the league.

After the Freedmen's bureau agents and other northern whites obtained command of the league in the south it became simply a machine to control the Negro vote. The league ceased to be important in the north, though headquarters were in New York city. Each southern state had its grand council and each county one or more councils.

A constitution and an elaborate ritual were adopted, making it an oath-bound secret order, whose members were sworn to support one another on all occasions, to vote in elections only for Negroes or northern men, and to overthrow the southern "white oligarchy." No ex-Confederate and few southern Unionists were permitted to join.

At each meeting the members were taught that they must beware of their white neighbours as their worst enemies, that the Democratic party, to which the southern whites belonged, had opposed emancipation and was still opposed to any rights for the Negro. To prevent moral control of the Negroes by former masters, the league, by an "exodus order," required all Negroes who were still living with their former masters to find other homes. The Negroes were taught the equality of men and the right of the Negro to his master's property.

The Negro vote during reconstruction was controlled by the few white Radical leaders and Negroes who voted with the mass of the southern whites were persecuted, beaten, or even, in a few cases, killed. The league died out about 1870 but not before it had succeeded, with the Freedmen's bureau and other forces, in permanently arraying the Negroes and the whites into opposing political parties.

UNION OF SOVIET SOCIALIST REPUBLICS, THE: *see* RUSSIA.

UNION PACIFIC RAILROAD extends from the Missouri river at Council Bluffs, Omaha, St. Joseph, and Kansas City, via Denver, Cheyenne, Ogden and Salt Lake City, to Los Angeles, to Portland, Ore., and to Seattle on Puget sound (and in connection with the Southern Pacific, to San Francisco and central and northern California). The railroad, a Utah corporation, at mid-20th century operated 9,756 mi. in 13 states. Including sidings, the total trackage was nearly 16,000 mi. The main line between Council Bluffs and Salt Lake City, 1,027 mi., is double tracked, as are several of the branch sections. The railroad owned, in 1950, about 1,500 locomotives, including 530 diesel-electrics ("A" and "B" units) and 1 experimental gas turbine-electric. In addition there were approximately 1,200 passenger cars and 55,000 freight cars.

The original company was incorporated in 1862 under an act of congress providing for the construction of a continuous line of railroad from the Missouri river to the Pacific ocean, as a measure of military protection, and for the preservation of the union. The connection of the line with the Central Pacific at Promontory, Utah, approximately 53 mi. west of Ogden, May 10, 1869, completed this first transcontinental railroad. The occasion was marked by ceremonies during which a golden spike was driven into the joining tie.

Although the company expanded rapidly to a route length of more than 7,000 mi. by 1893, it was struck by the business depression of that year and went into receivership. The government and other mortgages were foreclosed.

In the reorganization by E. H. Harriman and associates, the full amount of principal and interest of the government mortgage was repaid, and the other outstanding mortgages refunded. The present company, incorporated July 1, 1897, assumed operation Feb. 1, 1898. (W. M. Je.; X.)

UNIONTOWN, a city of southwestern Pennsylvania, U.S., 50 mi. S. by E. of Pittsburgh, the county seat of Fayette county; on federal highway 40, at an altitude of 1,020 ft. It is served by the Baltimore and Ohio and the Pennsylvania railways. Pop. 20,471 in 1950, 1940, 21,819 by the federal census.

A government airport and a commercial landing field are near by. A village was laid out there in 1776 on land belonging to Henry Beeson. It was incorporated as a borough in 1796, as a city in 1916 and has a commission form of government. On federal highway 40, 8 mi. E. of Uniontown, a monument marks the

spot where General Braddock died and was buried after his defeat by the French and Indians in 1755 Two miles farther east is the site of Ft. Necessity, built by Washington in 1754.

UNITARIANISM, a system of Christian thought and religious observance, deriving its name from its doctrine of the single personality of God the Father, in contrast with the Trinitarian conception of His threefold being as Father, Son and Holy Spirit. But the significance of the movement is imperfectly indicated by its name Its real importance lies in its teachings concerning mankind and the nature and work of Jesus Christ.

Free Study of the Bible.—The movement cannot be traced to any single teacher or any specific date; it had its sources in the thoughts of many minds in many lands

During the 17th century separate religious communities arose in Poland (now extinct) and in Hungary (Transylvania, now part of Rumania), standing for Unitarian Christianity, though not under that name; and afterward in England and in America, when the name came into general use. These societies took seriously the rule of "the Bible and the Bible only." And at the end of the following century we find the English Unitarians, in the petition presented to parliament in 1792, explaining their position by saying that they conceived it to be "their duty to examine into and interpret the Holy Scriptures for themselves, and their right publicly to declare the result of their enquiries."

A Twofold Tradition.—In the history of the movement two factors stand out as equally characteristic, distinctive and essential the demand for personal religious freedom, and the demand for clear, distinct and coherent religious thought and teaching.

(1) The demand for personal religious freedom, so far as England is concerned, can be traced directly to the Act of Uniformity (1662), under which 2,000 clergymen were deprived of their livings Richard Baxter (*q.v.*) represents the spirit of the ejected ministers at its best. He had no idea of complete toleration; but he stood for the endeavour to find a basis of agreement by reducing the number of the essentials and fundamentals. The influence of this endeavour, with its implied comprehensiveness and recognition of degrees of certainty, went on working after his death, and led to results undreamed of in his day. This history of a large number of churches in England, whose members now profess Unitarianism, begins with the ejection of 1662.

(2) Some of the ejected clergy, in the exercise of their freedom, arrived at the conviction that "the Trinitarian scheme" (by which they meant the whole scheme of salvation, with its doctrines of inherited guilt, eternal punishment, and vicarious atonement) was no part of essential Christianity. The advocacy of Joseph Priestley (*q.v.*), and the withdrawal of Theophilus Lindsey (1723–1808) from the Church of England to establish a Unitarian church in London (Essex street, Strand, 1774) aroused the liberal dissenters to consider their position, and to a large extent they found that they had grown into Unitarian Christianity.

There were also various interests which they had in common, in which they were threatened with serious injury. The penal laws against deniers of the Trinity were not repealed until 1813, and the Corporation and Test Acts (against all dissenters from the National Church) not until 1828. The general desire for more united and effective action led to the formation of the British and Foreign Unitarian association in 1825, by the amalgamation of three older societies for literature (1791), mission work (1806), and civil rights (1818).

Changing Bases of Belief.—At the beginning of the 19th century Unitarian Christianity was, broadly speaking, a biblical religion, accepting miracles, and rejecting creeds, not as incredible but as nonbiblical, resting its hopes on an external revelation, and attaching little importance to what it regarded as the uncertain influences and promises of "natural religion." Then this system in its turn gave way to a revised theology which was part of the changed outlook on the world and human history, due to the development of scientific and historical knowledge during the 19th century. A steady movement of doctrine can be traced among English Unitarian ministers and laymen, influenced by the personality and teaching of William Ellery Channing (1780–1842) and Theodore Parker (1810–60) from New England, and J. J Tayler (1797–1869), J. Hamilton Thom (1808–94), and above all, James Martineau (1805–1900), in England. The result of that movement has been that Unitarians no longer find the seat of authority only within the pages even of the best and broadest of books, but in religious history and experience, interpreted by the reason and conscience of mankind.

The past history of the Unitarian movement has stamped certain characteristics on its life. Many of its founders were forced into exile by exclusion from the larger historic Churches of Christendom; and this, together with its subsequent denominational history, has infused a certain habit of mind—of independent judgment, of bringing opinions to the bar of strong commonsense, of proving all things and holding fast that which is good But the need of more effective corporate union was deeply felt, and led to the union of the principal denominational organizations in a new and representative body, the "General Assembly of Unitarian and Free Christian Churches" (1928).

Wilbur, *Our Unitarian Heritage* (1926); and more briefly in J. E. Carpenter, *Unitarianism, a Historic Survey* (1923), and W. G. Tarrant, *The Unitarian Movement* (1910); with special reference to the period 1825–1925, S H. Mellone, *Liberty and Religion* (1925). (S. H. M.)

UNITED STATES

Unitarianism in the United States followed essentially the same development as in England, and passed through the stages of Arminianism, Arianism, antitrinitarian, to rationalism and a modernism based on a large-minded acceptance of the results of the scientific and comparative study of all religions. As early as the middle of the 18th century Harvard college represented the most advanced thought of the time, and a score or more of clergymen in New England were preaching what was essentially Unitarianism. The most prominent of these men was Jonathan Mayhew (1720–66), pastor of the West church in Boston from 1747 to 1766.

The first official acceptance of the Unitarian faith on the part of a congregation was by King's chapel in Boston, which settled James Freeman (1759–1853) in 1782, and revised the Book of Common Prayer into a mild Unitarian liturgy in 1785. Unitarian congregations were organized at Portland and Saco in 1792 by Thomas Oxnard; in 1800 the First church in Plymouth accepted the more liberal faith Joseph Priestley came to the United States in 1794, and organized a Unitarian church at Northumberland, Pa., in the same year, and one at Philadelphia in 1796. His writings had a considerable influence. Thus from 1725 to 1825 a more tolerant belief was developing in New England, and to some extent elsewhere.

William Ellery Channing was settled over the Federal Street Congregational church, Boston, 1803, and in a few years he became the leader of the Unitarian movement. At first mystical rather than rationalistic in his theology, he took part with the "Catholic Christians," as they called themselves, who aimed at bringing Christianity into harmony with the progressive spirit of the time. His essays, *The System of Exclusion and Denunciation in Religon* (1815) and *Objections to Unitarian Christianity Considered* (1819), make him a defender of Unitarianism. The Unitarian movement has grown slowly; and its influence has been chiefly exercised through general culture and the better literature of the country. Many of its clergymen have been trained in other denominations; but the Harvard divinity school was distinctly Unitarian from its formation in 1816, to 1870, when it became an unsectarian department of the university. By 1950 there were four colleges and seminaries and two preparatory schools associated with the Unitarian denomination. One of the oldest Unitarian schools is Meadville Theological school, founded in Meadville, Pa., in 1844 and moved to Chicago, Ill, in 1926.

Periods of Unitarian Thought.—By mid-20th century Unitarian thought in the United States had passed through three periods. The first, from 1800 to 1835, was formative, mainly influenced by English philosophy, semisupernatural, imperfectly rationalistic, devoted to philanthropy and practical Christianity. Channing was its distinguished exponent. The second, from 1835 to 1885, profoundly influenced by German idealism, was increasingly rationalistic, though its theology was largely flavoured by mysticism. The leaders of this second period were Emerson and Theodore Parker.

The third period, beginning about 1885, was one of rationalism, recognition of universal religion, large acceptance of the scientific method and ideas and an ethical attempt to realize the higher affirmations of Christianity It was marked by harmony and unity to a degree found in perhaps no other religious body, by steady growth in the number of churches and by a widening fellowship with all other progressive phases of modern religion During this period the influence of Emerson became predominant.

An International Council of Unitarian and Other Liberal Religious Thinkers and Workers was organized at Boston, Mass., on May 25, 1900, "to open communication with those in all lands who are striving to unite pure religion and perfect liberty, and to increase fellowship and co-operation among them" In 1910 this organization became the International Congress of Free Christians and Other Religious Liberals. Foreign work of the Unitarians is carried on through the auspices of the International Association for Liberal Christianity and Religious Freedom. This organization by mid-20th century had correspondents in 22 countries

Beyond its own borders the body has obtained recognition through the public work of such men as Henry Whitney Bellows and Edward Everett Hale, the remarkable influence of James Freeman Clarke and the popular power of Robert Collyer By mid-20th century the number of Unitarian churches in the United States was more than 350, with more than 450 ordained clergy, among whom were 10 women. Church membership exceeded 75,000. Of this number 50,000 were 13 years of age or over

H. L ; X.)

UNITED BRETHREN IN CHRIST, a U.S. religious sect which originated in the last part of the 18th century under the leadership of Philip William Otterbein (1726–1813), pastor of the Second Reformed church in Baltimore, and Martin Boehm (1725–1812), a Pennsylvanian Mennonite of Swiss descent. Otterbein and Boehm licensed some of their followers to preach and did a great work, especially through class meetings of a Wesleyan type; in 1789 they held a formal conference at Baltimore, and in 1800, at a conference near Frederick City, Md , the Church was organized and Otterbein and Boehm were chosen its first bishops or superintendents. In 1946 the United Brethren in Christ merged with the Evangelical Church to form the Evangelical United Brethren Church. The articles of the new church were derived principally from the Methodist Church and in turn from the Thirty-Nine articles of the Church of England. Baptism was required for membership. In organization the church was composed of a general conference with final authority in all church matters, 52 annual conferences and quarterly conferences presided over by local officials. General church officers are elected every four years at the meeting of the general conference.

At mid-20th century the combined church had more than 700,000 members affiliated to nearly 4,500 churches. It supported 11 colleges and seminaries, 2 children's homes and 7 homes for the aged.

UNITED FREE CHURCH OF SCOTLAND, a religious organization, representing the union made in 1900 between the Free Church of Scotland (except a dissentient section who separated off and retained the name of Free Church) and the United Presbyterian Church. (*See* FREE CHURCH OF SCOTLAND and UNITED PRESBYTERIAN CHURCH)

The first moderator was Dr. Robert Rainy. The Free Church brought into the union 1,077 congregations, the United Presbyterians 599; the revenue of the former amounted to £706,546, of the latter to £361,743

The minority of the Free Church who had refused to join the union lost no time in testing the legality of the act of the majority in entering it Their summons, dated Dec 14, 1900, claimed that in uniting with the United Presbyterian Church, which did not hold the principles of the Free Church, the majority had forfeited the right to the property of the Free Church, which must be judged to belong to the minority who remained faithful to the principles of the Free Church and were that Church. In the Scottish courts the case was decided in favour of the union on Aug. 9, 1901, and on July 4, 1902, but, on appeal, the house of lords, on Aug 1, 1904, by a majority of five to two, reversed these decisions, and found the minority entitled to the funds and property of the Free Church.

Few legal decisions have occasioned so great consternation or such serious practical difficulties. At first sight it deprived the majority of the Free Church section of the United Church of all its material goods—churches, manses, colleges and missions, even of the provision for the old age of the clergy, and handed them over to a body which could have little prospect of making effective use of them Nothing remained but to invoke the intervention of parliament to put an end to an impossible situation. In December a commission was appointed, consisting of Lord Elgin, Lord Kinnear and Sir Ralph Anstruther, to inquire into matters connected with the two churches, while the question of interim possession was referred to Sir John Cheyne, as commissioner, for inquiry and action.

The commission sat in public, and after hearing evidence on both sides, issued their report in April 1905. They reported that the state of feeling on one side and on the other had made their work difficult. They had concluded however that the Free Church was unable in many respects to carry out the purposes of the trusts, which, under the verdict of the house of lords, was a condition of their holding the property, and that there was a case for parliamentary interference. They recommended that an executive commission should be set up by act of parliament, in which the whole property of the Free Church, as at the date of the union, should be vested, and which should allocate it to the United Free Church, where the Free Church was unable to carry out the trust purposes. The Churches (Scotland) act, which gave effect to these recommendations, was passed on Aug. 11, 1905.

The allocation of churches and manses was a slow business, and involved litigation; but at length was carried through. (*See* FREE CHURCH OF SCOTLAND.)

In Oct. 1929 the United Free Church reunited with the Church of Scotland. The joint group was renamed the Church of Scotland. At mid-20th century the combined organization was composed of a general assembly, 12 synods and 66 presbyteries in Scotland, 1 presbytery in England and 3 in continental Europe. There were 2,360 congregations with 1,300,000 members, exclusive of adherents. Sunday schools numbered 2,900 with more than 300,000 scholars and teachers.

Including natives, there were about 13,000 agents in the church's foreign missions. These missions had an annual income of more than £1,000,000.

The Church is affiliated with four Scottish universities: Edinburgh, Glasgow, Aberdeen and St. Andrews. These are served by 28 professors and lecturers. (*See* also SCOTLAND, CHURCH OF)

UNITED KINGDOM OF GREAT BRITAIN AND IRELAND, the title of the former political unity composed of

England, Wales, Scotland and Ireland, officially adopted on Jan. 1, 1801, when the Act of Union between Great Britain and Ireland came into force. The name Great Britain has been used since the union of the kingdoms of England and Scotland in 1707 as the official designation of the united countries.

When, in 1922, 26 Irish counties were severed from the United Kingdom and erected into a dominion of the British empire under the name of the Irish Free State (later Eire), no provision was made in the act for any change in the royal style or in the title of the imperial parliament. It even seems to have been assumed that the Free State was to remain technically part of the United Kingdom, for in sec. 2 (1) of the Free State Constitution Act we read that "Goods transported during the current year from or to the Irish Free State or from *any other part of the United Kingdom* or the Isle of Man shall not . . ." From 1922 onward, however, the title of United Kingdom of Great Britain and Northern Ireland was frequently used in official documents to designate those parts of the British Isles represented in the imperial parliament, meeting at Westminster.

In the report of the interimperial relations committee of the Imperial Conference of 1926 it was suggested that, in view of new constitutional developments, the words "United Kingdom" should be omitted from the royal style, which should run: "George V., by the Grace of God, of Great Britain, Ireland, and the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India."

By the Royal and Parliamentary Titles Act, 1927 (17 Geo. 5. ch. 4), accordingly, the king was authorized to change the style and titles of the crown by royal proclamation. This was done, on May 13, 1927, by a proclamation adopting the recommendation of "the representatives of our Governments in Conference," and declaring that in the Latin style "Magnae Britanniae, Hibernae" should henceforth be used, and in the English style "Great Britain, Ireland and . . ." instead of "the United Kingdom of Great Britain and Ireland."

By the same act of parliament (2, 1) it was enacted that "Parliament shall hereafter be known as and styled the parliament of the United Kingdom of Great Britain and Northern Ireland." (*See* also ENGLAND; GREAT BRITAIN; IRELAND; IRELAND, NORTHERN; IRELAND, REPUBLIC OF; SCOTLAND; WALES.)

UNITED METHODIST CHURCH, or UNITED METHODISTS, an English Nonconformist community formed in 1907 by the union of the Methodist New Connection (1797), the Bible Christians (1815) and the United Methodist Free Churches (1857). The act of parliament which enabled this amalgamation received the royal assent on July 26, 1907. The union was completed on Sept. 16, 1907, in Wesley's chapel, City road, London. (For recent statistics *see* METHODISM.)

UNITED METHODIST FREE CHURCHES, an English Nonconformist community merged since 1907 in the United Methodist Church (*q.v.*).

UNITED NATIONS. On Jan. 1, 1942, 26 nations signed the declaration by the United Nations which affirmed their union against the axis powers. At Moscow in Oct. 1943 the United Kingdom, the Union of Soviet Socialist Republics and the United States, joined by the Republic of China, agreed to establish a general international organization for the maintenance of international peace and security "at the earliest practicable date." In the late summer and fall of 1944, representatives of these four powers met at Dumbarton Oaks (Washington, D.C.) to draw up a series of proposals for the new organization. These proposals were circulated among all states at war with the axis powers for comment and suggested amendment. An agreement on the voting procedure in the Security council was reached by Franklin D. Roosevelt, Winston Churchill and Joseph Stalin at the Yalta conference in Feb. 1945.

Forty-six states sent delegates to the conference which convened at San Francisco, Calif., on April 25, 1945, to draw up the charter of the United Nations. After the conference opened, four more states were admitted. The charter was signed on June 26 by representatives of 50 states; Poland signed on Oct 15. It entered into force on Oct. 24, 1945, when China, France, the U.S.S.R., the United Kingdom and the United States and a majority of other signatories had deposited their ratifications

Purposes and Membership.—The first article of the charter outlines the purposes of the organization The primary objective is the maintenance of international peace and security. The organization also dedicated itself to the development of friendly relations among nations, based on the principle of equal rights and self-determination of peoples; to the achievement of international co-operation in solving international problems of an economic, social, cultural or humanitarian character; and to serving as a centre for harmonizing the actions of nations in the attainment of these common ends.

Some of the basic principles of the United Nations, as outlined in article 2 of the charter, are as follows· the United Nations is based on the sovereign equality of its members, disputes are to be settled by peaceful means; members undertake not to use force or the threat of force in contravention of the purposes of the United Nations; each member must assist the organization in any action it takes under the charter; and states not members of the United Nations are required to act in accordance with these principles so far as may be necessary for the maintenance of international peace and security. Article 2 also stipulates that the organization shall not intervene in matters which are essentially within the domestic jurisdiction of any state, except to take enforcement measures

The original members of the United Nations were as follows· Argentina, Australia, Belgium, Bolivia, Brazil, Byelorussian S.S.R., Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, India, Iran, Iraq, Lebanon, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Panamá, Paraguay, Peru, Philippines, Poland, Saudi Arabia, Syria, Turkey, Ukrainian S.S.R., Union of South Africa, Union of Soviet Socialist Republics, United Kingdom, United States, Uruguay, Venezuela and Yugoslavia.

Other states were later admitted to membership in the United Nations: Afganistan (Nov. 19, 1946), Burma (April 19, 1948), Iceland (Nov. 19, 1946), Indonesia (Sept. 28, 1950), Israel (May 11, 1949), Pakistan (Sept. 30, 1947), Sweden (Nov. 19, 1946), Thailand (Siam) (Dec. 16, 1946) and Yemen (Sept. 30, 1947).

A favourable recommendation by the Security council, requiring the unanimous vote of the five permanent members of the council, and a two-thirds vote of the general assembly are necessary to the admission of a state to membership. Furthermore, the charter stipulated that a candidate to be admitted must be a peace-loving state, accept the obligations contained in the charter and be able and willing to carry out these obligations. Because of lack of agreement among the permanent members of the Security council, the following states had failed of admission to the organization by mid-1953. Albania, Austria, Bulgaria, Cambodia, Ceylon, Finland, Hungary, Ireland, Italy, Japan, Jordan, Laos, Libya, Mongolia, Nepal, Portugal, Republic of Korea, Rumania and Vietnam. The subject of admission of new members to the United Nations was the source of considerable debate in both the general assembly and the Security council and resulted in advisory opinions by the International Court of Justice

PRINCIPAL ORGANS

The United Nations has six principal organs: the general assembly, the Security council, the Economic and Social council, the Trusteeship council, the International Court of Justice and the secretariat.

General Assembly.—This is the only body on which all members are represented. Although a member may send five representatives to the general assembly, each member has only one vote. Decisions on substantive questions are taken by a majority or two-thirds vote, depending on the importance of the matters involved. Procedural questions are decided by a majority vote

Through its deliberative, supervisory, financial and elective functions, the general assembly occupies a key position in the functioning of the United Nations. Its role as a deliberative

organ finds its basis in articles 10 to 14 of the charter. Article 10, the most inclusive in its provisions, states that the general assembly may discuss and make recommendations on "any questions or any matters within the scope of the Charter or relating to the powers and functions of any organs provided for in the present Charter." The general assembly is expressly authorized to deal with specific disputes and situations brought before it and to undertake studies and make recommendations for promoting international co-operation in political, social, economic, cultural and educational matters, for encouraging the development of international law and for assisting in the realization of human rights and fundamental freedoms

In performing its supervisory functions, the general assembly exercises general control over the activities of United Nations organs in the economic and social fields and in dealing with the problems of non-self-governing territories. The general assembly receives annual reports from the secretary-general and the Security, Economic and Social and Trusteeship councils, and may make recommendations to these organs. The Economic and Social council and the Trusteeship council operate under the authority of the general assembly. The assembly approves trust agreements and through the Trusteeship council supervises the administration of trust territories. It exercises general supervision and control over the operations of the secretariat.

The financial power of the assembly is exercised through its control over the budget of the United Nations and the scale of assessments levied on members. In its elective capacity, the general assembly chooses all members of the Economic and Social council and the elective members of the Security and Trusteeship councils. Along with the Security council, it also participates in the election of judges of the International Court of Justice and the appointment of the secretary-general. The assembly shares with the council the power to initiate amendments to the charter as well as the right to convene a conference for the purpose of revising the charter.

Like other representative bodies, the assembly performs most of its work in committees. At each session, the assembly organizes six main committees (Political and Security; Economic and Financial; Social, Humanitarian and Cultural; Trusteeship and Non-Self-Governing Territories; Administrative and Budgetary; and Legal) to which agenda items are referred for consideration before coming to the plenary session of the assembly for final decision. Each member of the United Nations is represented on all the main committees.

The assembly has two procedural committees (the General committee and the Credentials committee), two standing committees (Advisory Committee on Administrative and Budgetary Questions and the Committee on Contributions) and a series of subsidiary organs such as the United Nations Commission for the Unification and Rehabilitation of Korea, the Peace Observation commission and the Collective Measures committee. Furthermore, in 1947 the assembly established the Interim committee to perform certain of its functions when the assembly is not in session. All members of the organization were to be represented on this committee; however, since the members of the Soviet bloc challenged the committee's legality and refused to sit on it, its utility proved to be limited.

The assembly convenes annually; it elects a president for each annual session and establishes its own rules of procedure. The first part of the first session of the assembly convened in London in Jan. 1946. Sessions of the assembly thereafter met in New York city, with the exception of the third and sixth sessions which convened in Paris in 1948 and 1951, respectively.

Security Council.—The charter places on the Security council the primary responsibility for maintenance of international peace and security. Eleven members of the United Nations are members of the council, the five permanent members (China, France, the United Kingdom, the U.S.S.R. and the United States) and six nonpermanent members, which are elected by the assembly and serve two-year terms. In selecting nonpermanent members, the assembly must strive for an equitable geographical distribution as well as consider their contribution to the maintenance of international peace and security. From the beginning, nonpermanent members of the Security council were elected with a view to giving representation to certain regions or groups of states. Thus one member was chosen from western Europe, one from eastern Europe, one from the Arab league, one from the British Commonwealth and two from Latin America. The Soviet Union asserted the right of a caucus of states from the group or region to nominate the member to be elected. This claim was challenged in 1949 when the general assembly elected Yugoslavia in the face of strong opposition by the Soviet bloc, whose candidate was Czechoslovakia, and again in 1951 when Greece was chosen instead of Byelorussia.

Under the charter, all members of the United Nations agreed to carry out the decisions of the Security council. This was interpreted to refer primarily to decisions under chapter VII of the charter. The council is authorized to investigate any dispute which might threaten international peace and security, and to make recommendations for its peaceful settlement. The council may also call on members of the United Nations to apply economic and diplomatic sanctions against any state which the council found guilty of breach of the peace or act of aggression. It may also decide what military measures are to be taken by members, but this power did not become operative because of the failure to conclude agreements specifying the armed forces and facilities to be placed at the disposal of the Security council by members. The council may also make recommendations on the regulation of national armaments.

On procedural matters, decisions by the council are made by an affirmative vote of any seven of its members; on substantive matters, which include the investigation of any dispute and the application of sanctions, seven affirmative votes including the concurrence of the five permanent members are required. A vote as to whether a matter is procedural or substantive is itself a substantive question.

The council is required to be so organized as to be able to function continuously. Each member is represented at all times at the seat of the organization. Like the general assembly, the council functions through subsidiary organs. The United Nations Commission for Indonesia and the United Nations Commission for India and Pakistan are examples of bodies established to assist in carrying out the council's resolutions. The presidency of the council rotates monthly.

The Military Staff committee, provided for in the charter, is responsible for the strategic direction and deployment of any armed forces placed at the disposal of the council.

Economic and Social Council.—The Economic and Social council is charged with directing and co-ordinating the complex system of economic, social, humanitarian and cultural activities of the United Nations. It comprises 18 members, elected by the assembly for three-year terms with the possibility of re-election. Although the council, unlike the Security council, has no permanent members, certain states, such as the permanent members of the Security council, were continually re-elected. The assembly endeavoured to keep the membership of the council representative of the world's economic, cultural and religious systems.

The Economic and Social council meets at least twice a year; it is directed by the charter to make or initiate studies and make recommendations with respect to the promotion of international co-operation in economic and social matters. It may prepare draft conventions for submission to the assembly and call international conferences for specific purposes.

The council is assisted in its work by functional and geographical commissions. The functional commissions carry out studies in the economic and social field and otherwise assist the council in the performance of its functions. They formulate resolutions, recommendations and international conventions on which the council and general assembly take action. The functional commissions initially established consisted of the following: Economic and Employment commission (with two subcommissions), Transport and Communications commission, Fiscal commission, Statistical commission (with one subcommission), Population commission, Social commission, Commission on Human Rights (with

two subcommissions on Freedom of Information and of the Press, and Prevention of Discrimination and Protection of Minorities). Commission on the Status of Women and Commission on Narcotic Drugs. The council organized three regional economic commissions on Europe, Asia and the Far East and Latin America which are designed to deal with specific regional economic problems. It also established several standing committees The *Ad Hoc* Committee on the Organization and Operation of the Council and Its Commissions, established in 1950 to review the commission structure of the council, proposed to dissolve two commissions and three subcommissions, and the council accepted and carried out these proposals.

Trusteeship Council.—Acting under the authority of the general assembly, the Trusteeship council supervises the administration of trust territories by the states which are administering authorities. The composition of the council ensures that membership is equally divided between members which administer trust territories and those which do not. Furthermore, the permanent members of the Security council are assured membership. The six members of the council who are administering authorities are: Australia, Belgium, France, New Zealand, the United Kingdom and the United States. China and the Soviet Union are members by virtue of permanent membership on the Security council. The remaining four nonadministering members are elected by the assembly for three-year terms.

The Trusteeship council is authorized to send visiting missions of inspection into the trust territories to receive and examine petitions, to consider reports submitted to it annually by the administering authorities and to make recommendations with respect to all matters coming within its purview. The council is required to submit annual reports on its activities to the general assembly.

International Court of Justice.—The court is the principal judicial organ of the United Nations. Its statute is an integral part of the charter of the United Nations.

The 15 judges of the court are elected by the general assembly and the Security council voting independently. No two judges may be nationals of the same state. Representation of the main forms of civilization and of the major legal systems of the world is to be assured. Judges serve for nine years and are eligible for re-election.

The jurisdiction of the court comprises all cases which parties submit to it, and all matters specially provided for in the charter or in other treaties. States, by formal declaration, may accept the compulsory jurisdiction of the court in specified categories of disputes. The court may give advisory opinions at the request of the general assembly or the Security council, or at the request of other organs and specialized agencies authorized by the general assembly.

The Secretariat.—The secretariat is headed by the secretary-general and consists of such staff as the organization may require. The secretary-general is appointed by the general assembly upon the recommendation of the Security council. At the beginning of its first session in 1946, the general assembly chose Trygve Lie (Norway) for a term of five years. His term was extended for three years in 1951, following failure of the Security council to recommend a person for the full five-year appointment. The secretary-general is the chief administrative officer of the United Nations. He also has important political functions, being specially charged with bringing before the organization any matter that threatens or violates international peace and security. He and his staff perform secretarial functions for the general assembly, the councils and the various subsidiary organs. He submits an annual report to the general assembly on the work of the organization during the preceding year.

The secretariat is divided into eight departments and the executive office of the secretary-general. These departments are as follows: Security Council Affairs; Economic Affairs; Social Affairs; Trusteeship and Information from Non-Self-Governing Territories; Public Information; Legal; Conference and General Services; Administrative and Financial Services. Each is headed by an assistant secretary general. The Technical Assistance administration is an independent agency headed by a director-general.

MAINTENANCE OF INTERNATIONAL PEACE AND SECURITY

By the terms of the charter, the members of the United Nations conferred upon the Security council primary responsibility for the maintenance of international peace and security. At the San Francisco conference, the basic assumption underlining the United Nations as an international security organization was that there would be agreement among the five permanent members of the Security council on important questions. In fact, it was made a charter requirement that substantive decisions of the council could be taken only with the concurrence of the permanent members. It was realized that should the Big Five fail to agree, the council would be unable to perform its functions. The growing rift between the Soviet Union and the western powers after 1945 resulted in frequent use of the veto, which seriously reduced the effectiveness of the Security council in the discharge of its primary responsibility. As a result, there was an increasing tendency to look to the general assembly to assume responsibilities in this field.

As early as 1946 the assembly was asked to deal with a situation originally brought before the Security council. In June 1946 the U.S.S.R. vetoed a council proposal dealing with Spain on the ground that it should have been more strongly worded. The council on Nov. 4 removed the question from its agenda to permit Poland to bring the question before the assembly, which finally adopted a resolution on Dec. 12, 1946. In the summer of 1947 a Soviet veto prevented the adoption by the Security council of a resolution approving the findings of a commission which had been set up to investigate the disorders on the northern borders of Greece. The question was removed from the council's agenda, and the United States brought the question before the assembly, where action was taken on the matter in Oct. 1947. The Palestine and Korean questions were brought directly to the assembly in 1947, although both constituted situations endangering international peace.

In the Korean case, an accidental set of circumstances (absence of the U.S.S.R. from the council, the availability of United States troops in Japan and the presence of a United Nations commission in Korea) enabled the council in June 1950 to take prompt action against the North Korean forces attacking the Republic of Korea. Realizing that such conditions would not be repeated in the future, the general assembly in Nov. 1950, on United States initiative, adopted the Uniting for Peace resolution by which the assembly assumed additional responsibilities for the maintenance of international peace and security. This resolution provided that the assembly should take action with reference to a threat or breach of the peace or act of aggression should the Security council fail to exercise its primary responsibility in that field. The assembly may be convened for the purpose by the secretary-general, if requested by the Security council or by a majority of the members of the United Nations, in an emergency session within 24 hours. The resolution requested United Nations members to set aside contingents in their national armed forces to be made available to the United Nations should the assembly recommend the use of armed force under this resolution.

The resolution also established the Peace Observation commission to observe and report on areas of the world where existing tension might impair international peace and security. The commission was directed to be at the disposal of the Security council or the assembly if the council was not exercising its functions It also established the Collective Measures committee to study and report on methods which the assembly might use in strengthening international peace and security.

Iran.—The first situation to be brought before the United Nations was Iran's complaint to the Security council of Jan. 19, 1946, that the Soviet Union was interfering with Iran's internal affairs by not withdrawing its troops from northern Iran. The council called on both parties to negotiate their differences. However, on March 18 Iran reported that the Soviet Union had not withdrawn its troops. On April 4, 1946, the council requested both parties to report to it by May 6 on progress made in the withdrawal

of the Soviet forces. Two days later, the U S S R requested the council to remove the matter from its agenda since Iran had sought to withdraw the original complaint, but the council rejected the Soviet proposal The Soviet representative withdrew in protest On May 6 Iran reported the withdrawal of Soviet troops from all provinces except Azerbaijan where facts were not known.

Greece.—The Greek question proved to be a more difficult issue for the United Nations to handle, requiring the attention of the general assembly as well as the Security council In Dec 1946 Greece charged that Albania, Bulgaria and Yugoslavia were aiding communist guerrillas in northern Greece, and asked the council to investigate this situation The council established the Commission of Investigation, which, after an on-the-spot examination of the alleged disorders, supported the Greek accusations A minority report submitted by Poland and the U S S R dissented. The council, unable to agree on proposals to remedy the situation because of the opposition of the U S.S.R , removed the question from its agenda on Sept. 15, 1947. The matter was brought before the general assembly by the United States In its resolution of Oct 21, 1947, the assembly requested all parties concerned to negotiate their differences, and established the United Nations Special Committee on the Balkans (U.N.S C O B.) to facilitate peaceful settlement of the dispute. The Soviet Union and the satellite states refused to co-operate. In its first report to the assembly in 1948 the committee reported the continuation of aggressive interventionist activity by Greece's northern neighbours. The general assembly in Nov 1948 called on Albania, Bulgaria and Yugoslavia to terminate their support of the communist guerrillas in Greece. It authorized the committee to continue its mediatory efforts. The situation had markedly improved by the end of 1948, not only because of United Nations action but also because of United States aid to Greece and Yugoslavia's break with Moscow. However, the problem of repatriating an estimated 28,000 Greek children continued to concern the United Nations. By 1952 this matter had decreased in importance, mainly through the work of the International Committee of the Red Cross and the League of Red Cross Societies. The sixth session of the assembly terminated the Special Committee on the Balkans, and the task of observing and reporting conditions along Greece's northern frontier was delegated to the Peace Observation commission.

Indonesia.—In July 1947 Australia and India called the Security council's attention to hostilities which had broken out between the Republic of Indonesia and the Netherlands After a debate in which the Netherlands unsuccessfully argued that the United Nations should not interfere since the matter was within the "domestic jurisdiction" of the Netherlands, the council called on the parties to cease hostilities and settle the dispute peacefully. It then appointed the Committee of Good Offices to facilitate a peaceful settlement In Jan 1948 both parties signed the "Renville" agreement, providing for a truce and setting forth the political principles to govern a truce settlement. However, after alleged violations of the agreement by both sides, and after the council repeatedly urged the parties to adhere to the truce, the Netherlands renounced the agreement in Dec. 1948 and resumed hostilities. In Jan. 1949 the Security council again called on both sides to terminate armed action, recommended the establishment of a federal, independent and sovereign United States of Indonesia at the earliest possible date, and changed the United Nations Commission for Indonesia (which replaced the Committee of Good Offices) to assist the parties in implementing this resolution. With the assistance of the commission, the parties involved finally reached agreement on the transfer of sovereignty from the Netherlands to the Republic of Indonesia at a round-table conference which met at The Hague from Aug. 23 to Nov 2, 1949. The formal transfer of sovereignty took place on Dec. 27, 1949.

Palestine.—The future of Palestine was one of the most difficult and complicated questions that the United Nations was called upon to handle. After World War II, because of the increased activity on the part of the Jews for a national home and place of refuge and the deterioration of relations between the Jews and Arabs, Great Britain requested that the secretary-general summon a special session of the assembly to deal with the matter. This session, meeting from April 28 to May 15, 1947, established the United Nations Special Committee on Palestine (U N.S C.O P) to investigate possible solutions of this problem. After inspecting conditions in Palestine, the special committee submitted majority and minority reports to the general assembly in Nov. 1947 The majority report, violently opposed by the Arab states, proposed the partition of Palestine into an Arab and Jewish state and the establishment of an international regime for Jerusalem, the three areas to be joined by an economic union. The minority plan called for an independent federal state The general assembly finally accepted the majority plan and called on the Security council to take enforcement action should any interested party attempt to use force to alter the proposed partition Great Britain announced its intention to terminate the mandate on May 15, 1948.

The increase in fighting between Arabs and Jews following the assembly's resolution indicated the extreme difficulty that the United Nations would encounter in implementing the partition plan. The assembly, meeting in special session in April and May 1948, decided to invite the permanent members of the Security council to appoint a United Nations mediator. Count Folke Bernadotte of Sweden was subsequently appointed He was directed to use his good offices to promote cessation of hostilities and a peaceful settlement of the dispute and also to assist the Security council's Truce commission which had been established previously

On May 15, 1948, Britain terminated its mandate over Palestine, and the new state of Israel was proclaimed. The Arab states immediately had recourse to armed force. In a series of resolutions, progressively more insistent, the Security council called on the parties to cease hostilities. On July 15 the council passed its strongest resolution, warning the parties that, unless they desisted from military action, enforcement measures by the United Nations would be undertaken. Through the efforts of Count Bernadotte, agreements for a truce were finally reached on July 16 and July 18

In its third session in the fall of 1948, the assembly established the United Nations Conciliation commission to assist Israel and the Arab states to reach agreement on boundaries, repatriation of refugees and a general peaceful settlement. Following the assassination of Count Bernadotte by Jewish terrorists in Sept. 1948, Ralph Bunche of the United States was appointed acting mediator During 1949 he was successful in negotiating armistice agreements between Israel and all the Arab states, with the exception of Iraq

The disposition of thousands of Arab refugees who fled their homes in Palestine during the period of hostilities and were widely scattered in camps in the Arab states remained a serious obstacle to a political settlement Israel refused repatriation of these refugees, while the Arab states insisted that a solution of this problem was a prerequisite to any political settlement. Efforts of the United Nations and of certain specialized agencies and non-governmental organizations, such as the Quakers and the Red Cross, ameliorated the situation, without however providing a solution of the problem. In 1951 the United Nations Conciliation commission attempted without success to achieve a political settlement

India-Pakistan Question.—The state of Jammu and Kashmir, located in the northern part of the Indian subcontinent between India and Pakistan, was given its choice, under the British Indian Independence act of 1947, to accede to either of its neighbours. Both India and Pakistan pressed their claims. In the fall of 1947 Moslem tribal groups invaded Kashmir, and Indian forces were sent in at the request of the Kashmir government after it had elected to accede to India. India brought the situation before the Security council on Jan. 1, 1948, and demanded that the council order Pakistan to desist from encouraging and supporting hostilities in Kashmir. Pakistan, however, denied India's accusation and requested the council to appoint a commission to assist in ending hostilities in Kashmir and to facilitate the withdrawal of Indian and Pakistan troops so that a plebiscite

could be held On Jan. 20, 1948, the Commission on India and Pakistan was established by the council and was directed to place its good offices and mediatory services at the disposal of the two states.

The situation in Kashmir showed little improvement, although a cease-fire agreement became effective on Jan. 1, 1949 Sir Owen Dixon of Australia was appointed by the Security council in April 1950 as United Nations representative for India and Pakistan to replace the commission; however, he was unable to bring the parties to agreement on the two basic issues, the demilitarization of Kashmir and the conduct of a free and impartial plebiscite Although both parties were in accord on the principle of having a plebiscite in Kashmir, neither could agree on the conditions for its conduct In April 1951 Frank Graham of the United States replaced Dixon as United Nations representative.

Korea.—The end of World War II found the northern half of the peninsula of Korea occupied by the U S S R. while the area south of the 38th parallel was held by United States forces. In conjunction with Great Britain and the Republic of China, both powers agreed at the Moscow conference in Dec 1945 that a unified and independent Korea was their eventual goal and that a joint commission should be established to constitute a provisional government in Korea and make proposals for a four-power trusteeship. When the Soviet Union and the United States reached an impasse in their negotiations to implement the Moscow agreements, the United States requested the general assembly in Sept. 1947 to consider the question. The U.S.S R strongly objected to United Nations consideration The assembly passed a United States-sponsored resolution which called for elections to be held in Korea preparatory to constituting a government for that country The Temporary Commission on Korea was appointed to prepare for the elections and to assist in the establishment of the government of a unified and independent Korea. It arrived in Korea early in 1948 The United States military command in South Korea wished to hold national elections, but the U.N commission was unable to gain admittance to North Korea to prepare for elections there. After consulting the Interim committee of the assembly in February, the commission decided to proceed with elections in South Korea alone On May 10, 1948, elections were held, and a government of the Republic of Korea was established The general assembly in Dec. 1948 declared that this was the only legal government in Korea. The assembly reiterated its determination to achieve the goal of a unified and independent Korea; however, in its subsequent efforts, the Korean commission met with little success.

Meanwhile, Soviet authorities assisted in the establishment of a government in North Korea, known as the People's Republic of Korea, which, like the Republic of Korea, also claimed to be the only legal government in Korea. During 1948–49 both the United States and Soviet troops were withdrawn from Korea Relations between the two governments in Korea indicated no possibility of agreement on a common government, and there were armed outbreaks around the 38th parallel during 1949 and early 1950

On June 25, 1950, the armed forces of North Korea invaded South Korea On the same day, the Security council, after deciding that this action constituted a breach of the peace, called on North Korean authorities to withdraw their armed forces behind the 38th parallel and demanded an immediate cessation of hostilities When the North Korean authorities disregarded this resolution, the council on June 27 called on members of the United Nations to "furnish such assistance to the Republic of Korea as may be necessary to repel the armed attack and to restore international peace and security in the area" Led by the United States, many U N. members gave material assistance to the Republic of Korea, and the great majority of the organization's members expressed strong support of these measures On July 7 the council requested the United States to appoint a supreme commander for United Nations forces in Korea, and Gen. Douglas MacArthur was so designated.

The United Nations forces in Korea met with many initial military reverses and were compelled to retreat to a small bridgehead around the town of Pusan in southeast Korea. The Inchon landing in mid-Sept 1950, however, led to the expulsion of the Communist forces from South Korea. Faced with the necessity of deciding whether to stop at the 38th parallel or to seek to drive the Communists from all of Korea, the general assembly in Oct. 1950 implicitly approved the latter course of action The assembly established the United Nations Commission for the Unification and Rehabilitation of Korea to carry out the original unification goal of the United Nations. The Soviet bloc violently opposed this action, and the Indian delegate to the United Nations, in expressing disapproval of the resolution, feared that it would endanger international peace in that part of the world The Communist government of China also warned that it would not permit armed action in North Korea When, in Nov 1950, the United Nations forces approached the Yalu river, which separates Korea from Manchuria, contingents from the Communist Chinese army assisted North Korean forces in repelling the United Nations troops and drove them back below the 38th parallel.

After failing to achieve a cease-fire and the peaceful settlement of the dispute, the assembly, on Feb 1, 1951, labelled Communist China an aggressor and established an Additional Measures committee to consider the application of sanctions against that government. On May 18 the assembly recommended that members apply an embargo on arms, munitions and other implements of war against areas controlled by the Communist government of China Many states were already applying such measures

In June 1951 the Soviet delegate to the United Nations, Jacob Malik, suggested that cease-fire talks be undertaken in Korea. Upon the initiative of the United Nations supreme commander, Gen. Matthew Ridgway, who had replaced General MacArthur in April 1951, cease-fire talks commenced on July 10 at Kaesong Marked by many interruptions, accusations and counteraccusations and some success, the negotiations continued into 1952.

Corfu Channel.—In Jan. 1947 Britain called the Security council's attention to a dispute with Albania concerning damage incurred by British warships and naval personnel as a result of the detonation of mines in the Corfu channel The U.S.S.R. vetoed a resolution which placed the blame on Albania, and the council recommended that Britain and Albania submit the dispute to the International Court of Justice Both parties eventually accepted the court's jurisdiction, and the court disposed of the matter

Berlin.—In Sept. 1948 the Security council considered the question of the Soviet blockade of west Berlin which severed contact between the western powers and their zones in the German capital. The U.S S.R. argued that the council had no authority to deal with this matter, and when the council, in Oct 1948, voted to place the question on its agenda, the Soviet Union refused to participate in the council's discussions of the blockade Although the council was unable to work out an acceptable solution to the question after several attempts, the United States and Soviet representatives on the council reached an understanding which permitted a settlement to be subsequently reached

Italian Colonies.—After the Council of Foreign Ministers was unable to agree on the disposal of the former Italian colonies of Libya, Somaliland and Eritrea following World War II, a clause was inserted in the Italian peace treaty of 1947 to the effect that, in the event of continued disagreement, the matter would be referred to the general assembly for a final determination. When agreement was again found impossible, the matter was placed before the assembly in April 1949 In Nov. 1949 the assembly decided that by Jan 1, 1952, Libya should become an independent state and that until then it should be administered by a United Nations commissioner, advised by a council of representatives consisting of six United Nations members and four local inhabitants. Under the guidance of Adrian Pelt, United Nations administrator, Libya was prepared for statehood, and on Dec. 24, 1951, became the first formerly dependent area to become an independent state under the aegis of the United Nations. Somaliland was placed under U.N. trusteeship, with Italy serving as the administering authority. The assembly declared that this former colony should receive its independence ten years after the as-

sembly approved of the trusteeship agreement, which it did in Dec. 1950. The assembly decided in 1950 that Eritrea should be federated with Ethiopia, although it should retain as much local autonomy as possible. The United Kingdom was selected as the administering authority to prepare for federation, which was to take place by Sept 1952.

Anglo-Iranian Oil Dispute.—After Iran disregarded the jurisdiction of the International Court of Justice over its dispute with the United Kingdom in the matter of oil nationalization, the Security council on Oct 1, 1951, took note of Great Britain's complaint that the Iranian action was tantamount to a confiscation of British property. Premier Mohammed Mossadegh of Iran argued before the council that the matter was wholly within Iran's domestic jurisdiction, and after six meetings devoted to discussion the council adjourned debate until the court had ruled on its own competence in the matter It subsequently decided in July 1952 that it did not have jurisdiction.

Other Disputes and Situations.—The United Nations during this period also considered the presence of British and French troops in Syria and Lebanon, the Spanish situation, treatment of Indian nationals in the Union of South Africa, and the alleged violation of civil-rights provisions of peace treaties with Hungary, Bulgaria and Rumania.

GENERAL QUESTIONS

Control of Atomic Energy.—The United Nations met with little success in the control of atomic energy, largely because of the deterioration in relations between the Soviet Union and the United States after 1945. The Atomic Energy commission was established by resolution of the general assembly in 1946 to assist the Security council in preparing plans for the control of atomic energy. The commission submitted reports to the Security council in 1946, 1947 and 1948. The majority of the commission called for international managerial control or ownership of atomic energy activities, international inspection by a proposed international atomic development authority and the elimination of the veto from enforcement provisions of the agreement. The majority also insisted that the control system should be in operation before the existing stock pile of atomic bombs was destroyed The Soviet Union, however, took an opposite view It refused to agree to international ownership and to the kind of international inspection demanded by the majority, it demanded that the veto be applicable to enforcement measures under the plan and that the destruction of atomic stock piles should accompany the establishment of a system of control. The commission recorded an impasse in negotiations in its 1948 report, though some agreement had been reached on matters of detail.

Reduction of Conventional Armaments.—The Security council organized the Commission for Conventional Armaments in Feb. 1947, following an assembly resolution of Dec. 1946 that general regulation and reduction of armaments should be undertaken by the council. A Working committee of the whole was constituted by the commission in July 1947, and that committee was charged with working out an adequate program of armament reduction. Progress in this field was likewise obstructed by the distrust between the Soviet bloc and the western powers. The commission in Aug. 1949 approved the Working committee's proposal that a census of national armaments should be taken. Although the assembly in Dec. 1949 approved a plan whereby each state would submit full information to the commission on its conventional armaments and armed forces, little progress was made in implementing the proposal.

The assembly established a Committee of Twelve in Nov 1950 to study a U.S.-sponsored resolution to combine the Atomic Energy and Conventional Armaments commissions, and in Jan. 1952 the assembly adopted a resolution merging the two commissions into a new Disarmament commission.

Relations between the Great Powers.—The general assembly made numerous appeals to the great powers to settle matters of international concern on a peaceful basis. In Dec. 1949 the assembly laid down a series of principles which it considered essential for an enduring peace. The assembly also exhorted the permanent members of the Security council to reach agreement on such matters as the admission of new members to the United Nations and to be more moderate in the use of the veto.

DEVELOPMENT OF INTERNATIONAL LAW

In Nov 1947 the general assembly established the International Law commission of 15 members to make recommendations for the progressive development of international law and its codification. In setting up the commission, the assembly directed it to formulate the principles of international law recognized at the Nuremberg trial of nazi war criminals and to prepare a draft code of offenses against the peace and security of mankind.

In 1950 the commission submitted its formulation of the Nuremberg principles, which covered crimes against the peace, war crimes and crimes against humanity. The assembly circulated these principles to member governments for comment. The commission presented to the assembly in 1951 draft articles on offenses against the peace and security of mankind, which enumerated 12 crimes against international law, including any act of aggression, threat of or preparation for aggression, annexation of territory and genocide The assembly also circulated this draft code among its members for comment and suggestions. While the commission did not include a definition of aggression in the draft code, the assembly in 1951 adopted a resolution to the effect that a legal definition of aggression was possible and desirable and recommended that the seventh session of the assembly attempt to define this term.

The commission prepared a draft declaration on the rights and duties of states which it submitted to the assembly in 1949. It was decided to be among the basic duties of a state to conduct international relations in accordance with international law and to observe legal obligations; to settle disputes peacefully and not by the use of force, and to refrain from recognizing any territorial acquisition resulting from war or other illegal use of force. Included among the rights of states were the rights to independence, to equality in law and to individual and collective self-defense in cases of armed attack.

The commission made studies of the possibility of codifying certain branches of international law, giving priority to the law of treaties. Also, it prepared a study on the legal aspects of reservations to multilateral conventions.

ECONOMIC AND SOCIAL CO-OPERATION; SPECIALIZED AGENCIES

A major purpose of the United Nations is "to achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion." The general assembly, the Economic and Social council, along with the council's commissions, the secretariat and the specialized agencies are the organs primarily responsible for action in this field. An important part of the United Nations activity consists of research, publication and the rendering of technical assistance to governments. The United Nations has no authority to legislate or to enforce measures of economic and social co-operation; it can only make recommendations which the member governments may or may not follow.

It was believed by those who drafted the United Nations charter that many areas of economic and social co-operation, while requiring an intergovernmental approach, could be more effectively covered by relatively autonomous functional organizations. Consequently, it was assumed that international co-operation in this field would find expression in a great variety of intergovernmental organizations Of these, those with "wide international responsibilities" were to be brought into relation with the United Nations as specialized agencies. This relationship might initially be defined by an agreement concluded with the specialized agency by the Economic and Social council subject to general assembly approval. The charter provided that the general assembly and the Economic and Social council should undertake to co-ordinate the policies and activities of the specialized agencies. The general as-

sembly may review and make recommendations subject to the administrative budget of an agency; both the assembly and the Economic and Social council may make recommendations with respect to program

Each specialized agency in fact concluded an agreement with the United Nations defining in general terms its relation to the latter. These agreements contain provisions regarding such matters as reciprocal representation, exchange of information and documents, administrative co-operation, annual reports and action to be taken on general assembly recommendations. An Administrative Committee on Co-ordination, composed of the secretary-general and the executive heads of the specialized agencies, was established by the Economic and Social council to assist in co-ordinating and harmonizing the relations between the agencies and the United Nations.

The general structure of each specialized agency follows a common pattern. There is provision for a general conference in which all members are represented The conference elects an executive body which is charged with initiating proposals and carrying out decisions of the general conference. Each agency has a permanent secretariat, headed by a director Many agencies have regional subcommissions operating in various parts of the world Some of the specialized agencies were in existence before the United Nations was organized, some were in process of establishment during World War II and some agencies were organized under the auspices of the U.N One agency, the International Refugee organization (I R O), terminated its activities at the end of Jan. 1952. Those in operation after that date are the following:

International Labour Organization (I.L.O.).—The I.L O. was established at the end of World War I as an international organization to improve labour conditions. Its constitution was incorporated in the peace treaties, along with the covenant of the League. It survived World War II and was accepted by the United Nations as a specialized agency. An agreement with the U.N. was approved by the general assembly on Dec. 14, 1946.

The main function of the I.L.O. is the improvement of labour conditions throughout the world. The conclusion of international conventions is one of the principal methods by which the I.L.O. seeks to achieve this purpose. The organization is unique in that its constitution provides for the representation of private organizations (employer and labour) as well as governments in its conference and governing body. Its headquarters are in Geneva, Switz At the beginning of 1952 the I L O. had 65 members.

Food and Agriculture Organization of the United Nations (F.A.O.).—The F.A.O came into being on Oct. 16, 1945, with the signing of the constitution. An agreement between the F.A.O. and the United Nations was approved by the general assembly on Dec. 14, 1946. The main functions of the F.A.O. are to raise the nutritional levels and living standards of the world's peoples, to secure improvements in production and distribution of food and agricultural products and to better the conditions of country dwellers. The headquarters of the F.A O are in Rome, It. The F.A O had 70 members at the beginning of 1952.

United Nations Educational, Scientific and Cultural Organization (U.N.E.S.C.O.).—U.N.E S.C O. came into being on Nov. 4, 1946, on the basis of a constitution drafted and signed at London in Nov. 1945. An agreement between U N E S.C.O and the United Nations was approved by the general assembly on Dec. 14, 1946. The central aim of U.N.E.S.C O. is to achieve international peace through the diffusion and interchange of education, science and culture among all the peoples of the world. Its headquarters are in Paris, Fr., and at the beginning of 1952 it had 64 members.

International Civil Aviation Organization (I.C.A.O.).—The I C.A.O. came into being on April 4, 1947, on the basis of a convention drafted at Chicago, Ill., in 1944. During the intervening period a provisional organization operated. An agreement between I.C.A.O. and the United Nations was approved by the general assembly on Dec. 14, 1946. The main functions of the I.C A O. are the development of principles and techniques of international air navigation and the planning and development of international air transport. Its headquarters are in Montreal, Que.; at the beginning of 1952 it had 57 members.

International Bank for Reconstruction and Development.—The bank came into being Dec 27, 1945, on the basis of articles of agreement drafted and signed at Bretton Woods, N.H., in July 1944. An agreement between the bank and the United Nations was approved by the assembly on Nov 15, 1947. The main functions of the bank are to assist in the reconstruction and development of member countries by facilitating the investment of capital for productive purposes, to promote the flow of private capital toward international investment and to contribute toward the goal of balanced international trade. The headquarters of the bank are in Washington, D C. At the beginning of 1952 it had 50 members.

International Monetary Fund.—The fund came into being Dec. 27, 1945, on the basis of articles of agreement drafted and signed at Bretton Woods in July 1944. An agreement between the fund and the United Nations was approved by the assembly on Nov. 15, 1947 The main functions of the fund are to promote stability in the exchange rates of the world's currencies and to assist in the curtailment of competitive practices in exchange depreciation. Its headquarters are in Washington, D.C.; at the beginning of 1952 the fund had 50 members.

World Health Organization (W.H.O.).—The W H O came into being on April 7, 1948, on the basis of a constitution signed in New York city July 22, 1946 An interim commission functioned during the intervening period An agreement between W H O. and the United Nations was approved by the assembly on Nov. 15, 1947. The main functions of W H O. are the eradication of epidemic, endemic and other diseases, the improvement of nutrition, housing, sanitation and other aspects of environmental hygiene, the promotion of maternal and child health and research in the field of private and public health. Its headquarters are in Geneva. At the beginning of 1952 it had 68 members

Universal Postal Union (U.P.U.).—The agreement between the U P.U. originally established in 1874, and the United Nations was approved by the assembly on Nov. 15, 1947. The main function of the U.P U. is to promote international postal co-operation with a view to improving international postal service. Its headquarters are in Berne, Switz. At the beginning of 1952 the U.P.U had 89 members (including colonial areas)

International Telecommunication Union (I.T.U.).—The I.T.U. came into being Jan. 1, 1934, on the basis of a convention signed Dec. 9, 1932, merging the International Telegraph union (established in 1865) and the International Radio-telegraph union (established in 1906) An agreement between the I.T U. and the United Nations was approved by the general assembly on Nov. 15, 1947. The purpose of the I T U is to establish international regulations for radio, telegraph and telephone services. Its headquarters are in Geneva. At the beginning of 1952 it had 85 members (including colonial areas).

World Meteorological Organization (W.M.O.).—The W.M.O. came into being March 23, 1950, replacing the International Meteorological organization which was established in 1878. An agreement between the W.M.O. and the United Nations was approved by the general assembly in Dec 1951 The purposes of W.M.O. are to co-ordinate, standardize and improve world meteorological activities and to encourage exchange of meteorological information among its members. Its headquarters are in Geneva; at the beginning of 1952 it had 74 members.

Two other specialized agencies were envisaged in agreements which had been signed but had not yet come into force at the beginning of 1952. They are the International Trade organization (I T O), the charter of which was signed at Havana, Cuba, March 24, 1948, and the Inter-Governmental Maritime Consultative organization (I.M.C O.), the convention for which was drafted at a conference held in Geneva in February and March 1948. The purpose of I T O. is to encourage the expansion of international trade by establishing a code of fair dealing in international trade and by encouraging the reduction of trade barriers and the elimination of discriminatory practices. The purpose of I.M C.O. is to facilitate intergovernmental co-operation in the shipping field with a view to improving shipping services.

Economic Reconstruction and Development.—The devastation of large areas during World War II, as well as the substandard existence of almost two-thirds of the world's population, became of vital concern to the United Nations. The United Nations Relief and Rehabilitation administration, established in 1943, did much to alleviate the results of the war's devastation and dislocation, and the International bank extended numerous loans to dislocated and underdeveloped areas. Since the bank can make loans only for self-liquidating projects, however, the long-range needs of many states, such as construction of roads and dams, educational and welfare programs and land reform, require long-term investment. The assembly and the Economic and Social council undertook studies and made recommendations on the necessity of land reform and the establishment of an international fund to finance economic development and reconstruction

The Economic and Social council, realizing that many problems of an economic nature demand treatment and solution on a regional level, established three economic commissions The Economic Commission for Europe and the Economic Commission for Asia and the Far East were established in 1946, and the Economic Commission for Latin America was set up in 1948. The Economic Commission for Europe made an important contribution to the economic reconstruction of that area. Its work, particularly after 1947, was handicapped by the developing east-west conflict. The Economic Commission for Asia and the Far East was active in considering the special economic problems of that area, largely problems of underdeveloped economies.

Technical Assistance.—Closely related to the problem of economic development is technical assistance to underdeveloped areas of the world. A modest program of technical assistance was undertaken at an early stage. World attention became centred on the problem with the announcement of Pres Harry S. Truman's Point Four program. The expanded program for technical assistance was approved by the general assembly in 1949 It was undertaken with a view to raising the standard of living and promoting economic assistance to underdeveloped areas

Aside from the Technical Assistance administration, a branch of the secretariat, there are two other United Nations agencies with responsibilities in connection with the implementation of this program. The Technical Assistance board, composed of the secretary-general of the United Nations and the executive heads of the five participating specialized agencies (I L O., F A O, U N E S C O, W.H O and I.C A.O.), surveys all requests to the Technical Assistance committee, which is composed of representatives of the 18 members of the Economic and Social council. To finance the assistance projects, a Technical Assistance conference was convened in June 1950, and $20,000,000 was pledged by member states. This procedure was repeated in Feb 1952

Refugees.—The International Refugee organization, a specialized agency which was established in 1946 and terminated its activities in 1952, took over the refugee functions of the United Nations Relief and Rehabilitation administration which expired in 1947. The I R O was successful in resettling, repatriating, transporting and maintaining more than 1,000,000 European refugees. Since the I.R.O. was conceived as a short-term emergency organization, a new refugee structure was devised in 1951. A United Nations high commissioner for refugees was appointed and was directed to act under the Convention Relating to the Status of Refugees, which was drawn up by the Economic and Social council and approved by the general assembly in 1951. An Advisory Committee on Refugees was appointed by the council in 1951 to assist the high commissioner.

Human Rights.—The general assembly in 1948 adopted the Universal Declaration of Human Rights, which was prepared by the Commission on Human Rights. In 1948 the commission began attempts to draft a Covenant of Human Rights which, upon ratification by governments, would become legally binding upon them However, in view of differences of economic and social philosophy, often reflecting differences of economic and social conditions within states, great difficulty was encountered in efforts to achieve agreement on a common text Some members insisted on the inclusion of economic and social rights, while others insisted that only political and civil rights should be protected. In the general field of human rights, the assembly also concerned itself with discrimination against Indian nationals in the Union of South Africa and the violations of civil-rights provisions of peace treatres by Hungary, Rumania and Bulgaria.

Control of Narcotics.—The Commission on Narcotic Drugs was authorized by the assembly in 1946 to carry out the functions entrusted by international conventions to the League of Nations Advisory Committee on Traffic in Opium and Other Dangerous Drugs. The agreements, conventions and protocols on the control of narcotic drugs concluded in 1912, 1925, 1931 and 1936 were amended in a draft protocol which was approved by the assembly in Nov. 1946 and which subsequently came into force among its signatories. In addition to re-establishing the pre-World War II system of narcotics control, which had suffered from the dislocations of the war, the United Nations concerned itself with new problems resulting from the development of synthetic drugs. Efforts were made to simplify the system of control by drafting one convention incorporating the provisions of all agreements in force

Other Economic and Social Activities.—The United Nations also concerned itself with the rights of women in matters such as employment, educational opportunities and property rights Among its more important publications are the *Statistical Yearbook*, the *Demographic Yearbook* and the *Yearbook on Human Rights*

The general assembly established the United Nations International Children's Emergency fund in Dec. 1946 to provide for the emergency needs of children in devastated areas. Financed by contributions from member states, U.N I.C.E F. has been effective in sustaining basic nutritional requirements for destitute children in more than 50 countries, preventing such communicable diseases as tuberculosis, whooping cough and diphtheria and providing for children's clothing and other needs U N I C.E.F. has trained child welfare workers, laid emphasis on milk-conservation programs, and worked effectively with the Arab refugees in the middle east.

In 1946 the assembly requested the Economic and Social council to formulate a genocide convention for adoption by member states. The assembly unanimously approved the Convention on the Prevention and Punishment of the Crime of Genocide in Dec. 1948. The convention makes genocide a crime under international law whether committed in time of peace or war.

DEPENDENT AREAS

On two different levels, the United Nations maintains concern for people residing in non-self-governing territories· (1) under principles and procedures developed for making administering states internationally accountable for the treatment of their non-self-governing territories; and (2) under the United Nations trusteeship system applicable to certain territories placed under it.

Non-Self-Governing Territories.—Under article 73 of the charter, members of the United Nations with responsibilities for the administration of non-self-governing territories agreed to grant the people of such territories political, economic, social and educational advancement, just treatment and protection against abuses, to develop self-government, to further international peace and security; to promote constructive measures of development; and to transmit to the secretary-general information of a technical nature concerning the economic, social and educational conditions in their territories. In 1947 the general assembly created the Special Committee on Information Transmitted under Article 73e of the Charter to receive and analyze information on these territories and to make recommendations to the administering authorities on the basis of information received Although originally established as an *ad hoc* organ, the special committee became a permanent unit of the U.N.

The general assembly placed emphasis on economic development, raising standards of nutrition and health, and land reform in non-self-governing territories. Furthermore, the assembly encouraged the administering authorites to co-operate with non-governmental organizations and the specialized agencies in meeting the United Nations' objectives under article 73. A notable

achievement in this respect was the conclusion of an agreement in 1951 between the United Kingdom and the United Nations Technical Assistance board which provided for the application of the technical assistance program to dependent areas under British administration.

The Trusteeship System.—The United Nations trusteeship system, successor to the League mandate system, made provision for bringing the administration of certain non-self-governing territories under international guarantees that certain standards would be observed The trusteeship system is applicable to former League of Nations mandated territories, territories detached from axis states as a result of World War II and territories voluntarily placed under the system by the states responsible for their administration. In order for a territory to be under trusteeship, it is necessary for an agreement to be concluded between the states "directly concerned," subject to general assembly approval. In practice the administering state has proposed the terms of the agreement which have become operative upon general assembly approval.

At the beginning of 1952 the following territories were under trusteeship with the administering authorities as indicated the Cameroons (United Kingdom); Cameroun (France); New Guinea (Australia); Nauru (Australia); Ruanda-Urundi (Belgium); Somaliland (Italy); Tanganyika (United Kingdom); Togoland (United Kingdom); Togoland (France), Western Samoa (New Zealand); and the strategic Trust Territory of the Pacific Islands, including the Marianas, Marshalls and Carolines (United States).

Each trusteeship agreement delineates the authority and obligations of the administering state in the trust territory and provides for the implementation of the powers vested in the organs of the United Nations by provisions of the charter. Strategic areas may be placed under a special regime which vests responsibility for supervision in the Security council and gives the administering authority greater discretionary powers. Each administering authority is required to submit an annual report based on a questionnaire prepared by the Trusteeship council. A representative of the administering state is required to be present when the council examines the report and is interrogated by members of the council after he submits an oral statement Persons residing in the trust territories or outside may petition to the council with respect to any grievances, complaints or suggestions they may have regarding the administration of the territory.

The Trusteeship council sends visiting missions to each of the trust territories, to investigate and report on conditions and the extent to which the administering authority is carrying out its obligations. Missions were thus dispatched to the trust territories in the Pacific, to Western Samoa and to East and West Africa On the basis of full discussion, the Trusteeship council prepares its report to the general assembly, incorporating recommendations with respect to the administration of the trust territory in question. The general assembly customarily accepts the recommendations of the council If the administering authority refuses to conform, the organs of the United Nations can do little more than publicize the facts. The United Nations does not have the power to terminate the authority of an administering state for failure to discharge its obligations under the charter. Experience indicated, however, that the administering authorities had taken seriously the constructive criticism and suggestions of the Trusteeship council and general assembly.

ADMINISTRATION AND FINANCE

Personnel.—The secretariat of the United Nations, serving under the secretary-general, is part of the United Nations machinery influencing the day-to-day work of the organization to a degree which the words of the charter would not indicate The extent of this influence is in large measure a result of the fact that the secretariat members are permanent expert officials. The secretariat staff is recruited on a merit basis but with regard to equitable geographical distribution. In the first two years of the organization's existence, the preponderance of United States nationals on the staff caused considerable concern among many delegations. Consequently, the assembly in 1947 adopted a resolution calling on the secretary-general to study the recruitment policy with a view to improving the geographical distribution of the staff. Members of the organization are required to take an oath of loyalty to the United Nations and are not permitted to receive instruction from member governments The staff of United Nations headquarters at the beginning of 1952 numbered approximately 3,500, with about 500 other members located in Geneva and other parts of the world.

In Nov 1949 the general assembly established a United Nations Administrative tribunal to hear and pass on alleged violations of staff contracts and other conditions of employment in the secretariat The tribunal is composed of seven members, no two of which may be nationals from the same state. In decisions handed down in 1951 the tribunal established the principle that staff members are entitled to due process when questions of contract renewal are being considered.

A United Nations Field service and a United Nations Panel of Field Observers were organized by the assembly in 1949 The Field service performs security functions for United Nations missions in many parts of the world, and the Panel of Field Observers assists the various missions in supervising truces and observing plebiscites. Both are under the secretary-general

Finance.—The secretary-general must submit an annual budget including estimated expenditures to the general assembly for approval After estimates have been made by each branch of the secretariat and submitted to the secretary-general, he compiles his annual budget estimates which he presents to the general assembly before each annual session. The assembly's Advisory Committee on Administrative and Budgetary Questions examines the estimates and makes recommendations on them to the fifth committee of the assembly (Administrative and Budgetary). This committee makes recommendations to the general assembly for final adoption The annual budget of the United Nations rose from $19,390,000 in 1946 to $48,096,780 in 1952.

The charter stipulates that the expenses of the organization shall be borne by members as apportioned by the general assembly. The Committee on Contributions prepares a scale of assessments for each member, based on the general economic level and capacity of each state, which is submitted to the general assembly for approval. The United States' contribution became the largest of any member, starting at about 49% of the total. The U S. argued that no one member should pay more than one-third in order that it should not have too great a financial interest in the organization, and its contribution was progressively reduced to the point where it approached that proportion.

Privileges and Immunities.—A General Convention on Privileges and Immunities of the United Nations approved by the general assembly in Feb 1946 asserted that the U N. possesses juridical personality. It provides for such matters as the immunity from legal process of the property and assets of the United Nations and for the privileges and immunities of the representatives of members, officials of the United Nations and experts on missions of the organization. A headquarters agreement between the U.N. and the United States was signed in June 1947, defining the privileges and immunities of the United Nations headquarters in New York city

Headquarters.—The general assembly decided during the second part of its first session in New York to locate its permanent headquarters in that city. John D. Rockefeller, Jr., made a gift of land for a building site in Manhattan, and a loan of $65,000,000 from the United States permitted plans to be initiated for the construction of permanent buildings Temporary headquarters were established at Lake Success. The Secretariat building was completed and occupied in 1951 The building providing accommodations for the general assembly and the councils was completed and occupied in early 1952.

In 1947 the assembly adopted a United Nations flag. Its design consists of the official emblem of the United Nations in white, centred on a light-blue background. The assembly also designated Oct. 24 as United Nations day. (L. M. Gh.)

UNITED PRESBYTERIAN CHURCH (of Scotland).

This Presbyterian organization, merged since 1900 in the United Free Church of Scotland (*q v*), was formed in 1847 by the union of the United Secession and Relief Churches.

The general causes which led to the first great secession from the Church of Scotland, as by law established in 1688, are indicated in the article SCOTLAND, CHURCH OF Its immediate occasion rose out of an act of assembly of 1732, which abolished the last remnant of popular election by enacting that, in cases where patrons might neglect or decline to exercise their right of presentation the minister was to be chosen, not by the congregation, but only by the elders and Protestant heritors The act itself had been passed by the assembly, although the presbyteries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were rejected. The protests however were vigorously renewed by Ebenezer Erskine, minister of Stirling He was soon joined by other ministers, who in Dec 1733 constituted themselves into a presbytery, disowning the authority of the general assembly The members of the Associate Presbytery and its adherents steadily increased, until in 1745 there were 45 congregations under its jurisdiction, and it was reconstituted into an associate synod. A violent controversy respecting the religious clause of the oath taken by burgesses in Edinburgh, Glasgow and Perth ("I profess and allow with my heart the true religion presently professed within this realm and authorized by the laws thereof"), resulted in April of 1747 in a breach, when two bodies were formed, each claiming to be the Associate Synod; those who condemned the swearing of the burgess oath as sinful came to be popularly known as "Anti-burghers," while the other party, who contended that abstinence from it should not be made a term of communion, were designated "Burghers." The Associate (Anti-burgher) Synod held its first meeting in Edinburgh on April 10, 1747 It grew with considerable rapidity, and for purposes of organization was formed into four provincial synods, and took the name of the General Associate Synod. The Associate (Burgher) Synod held its first meeting at Stirling on June 16, 1747. The number of congregations under its charge also increased, and in 1820 the General Associate or Anti-burgher Synod (to the number of 129 congregations) united with the 154 congregations of the Associate or Burgher Synod The body thus constituted, the United Secession Church, had increased by 1847 to 400 congregations

In 1847 a union was formed between all the congregations of the United Secession Church and 118 out of 136 of the Relief Churches, in what now became the United Presbyterian Church. Doctrinally there was little difference between the United Presbyterian Church and the Free Church of Scotland, and between 1863 and 1873 negotiations were carried on for a union, which however were fruitless In 1896 the United Presbyterian Church again made advances which were met, and on Oct 31, 1900 the United Free Church of Scotland came into existence.

UNITED PRESS ASSOCIATIONS, founded in 1907 through merger of Publishers' Press, Scripps-McRae Press association, and Scripps News, became one of the world's largest distributors of spot news By mid-20th century it supplied news dispatches daily to more than 4,000 clients in the United States and in 68 foreign countries Bureaus were maintained (79 in the U S, 78 in other nations) in every important world news centre, from which staff correspondents dispatched news by cable and radio. These offices abroad were joined by a network of radio transmission and by leased wires which in Europe alone amounted to a length of more than 10,000 mi

Serving as it does newspapers of all shades of editorial policy, U.P. does not take sides on any controversial subject. Its only function is reportorial, and the management insists on accuracy and impartiality.

The U.P also opened services for radio and television stations, supplying them with dispatches and scripts. News is distributed in Great Britain and the British dominions by British United Press, organized in 1922. United Feature syndicate, a U.P. subsidiary, by the 1950s supplied feature material to 2,000 papers in the U.S and abroad, handling the works of well-known columnists, feature writers and cartoonists. Ocean Press, another subsidiary, was organized to transmit world news by radio to passenger ships at sea, many of whom publish daily newspapers

The company was incorporated in New York with headquarters in New York city Regional officers and executives were stationed in other world news centres (H. BA.; X)

UNITED PROVINCES, the name by which the state of UTTAR PRADESH in the Republic of India was known under British administration from 1937 and until after the passing of the republican constitution The name North-Western Provinces was used by the British until 1902; United Provinces of Agra and Oudh from 1902 to 1937 The state includes the former states of Rampur, Tehri-Garhwal and Benares, merged with it under the scheme brought to completion by the government of India It is bounded on the north and northeast by Tibet and Nepal and comprises the whole of the upper part of the Gangetic basin, from the Himalaya and the Punjab border to the Vindhyan plateau and the rice lands of Bihar, an area roughly corresponding to the Hindustan of the old Moslem chroniclers. To this it adds the great semicircular tract, watered by the Gogra and the Gumti, which was formerly the kingdom of Oudh The total area is 112,523 sq mi.

The population (63,254,118 in 1951) is larger than that of any other state of the republic. In the census of 1941, 83.3% of the population were Hindus and 15.3% Moslems, but the movement of population caused by partition, added to the nonclassification of communities by religion, made it subsequently impossible to determine accurately whether this ratio was maintained. The number of displaced persons in the Uttar Pradesh was 475,822 in 1951. Hindustani or Urdu and Hindi (Eastern and Western) are the chief languages.

Physical Aspects.—At one end the state rises into the Himalaya and includes, at one extreme, some of the grandest of the peaks which look out upon upper Asia. At the other extreme, where it borders on central India, it has a fringe of rough, broken and picturesque country Apart from these, however, it is a level and somewhat monotonous expanse, well-drained, closely cultivated and studded with villages, the number of which (nearly 105,000) far exceeds that in any other state Many of them, standing high on the debris of older sites, have the air of fortified places; and the fine mango groves which often adjoin them redeem the bareness of the surrounding plain.

The flora of the forests is rich and varied. The sal tree yields the most important timber. The hard wood of the *shisham* is also valuable, and several other timber trees afford materials for furniture or roofing shingle Among the scattered jungles in various parts of the province, the mahua tree is prized alike for its edible flowers, its fruits and its timber. The fauna comprises most of the animals and birds common to the Gangetic plain; but the wild elephant is now practically unknown, except when a stray specimen loses its way at the foot of the hills. Tigers are found in any numbers in the *tarai* only Leopards haunt the canebrakes and thickets along the banks of the rivers; and nilgai and antelopes abound Game birds consist of teal and wild duck, snipe, jungle fowl and peacock.

The Ganges and its great affluents, the Jumna, the Ramganga and the Gogra, rise in the Himalaya and meet within the province. In addition there are the secondary streams the Kalinadi and the Hindan flow through the Doab; the Chambal intersects the trans-Jumna tract. In Bundelkhand the principal streams are the Betwa and the Ken. The Ramganga, rising in Garhwal, pursues a tortuous course through Rohilkhand; the Gumti flows past Lucknow and Jaunpur to join the Ganges and the trans-Gogra region is divided into two nearly equal parts by the Rapti. These rivers are constantly modifying the adjacent lands.

Climate.—The climate as a whole is hot and dry. The Himalayan districts of course are cool and have a much greater rainfall than the plains. They are succeeded by a broad submontane belt, the *tarai*, which bears the reputation of being the most unhealthy in all India; in many parts only the acclimatized aborigines can withstand its deadly malaria. The plain country is generally warm

and dry, the heat becoming more oppressive as the general level of the country sinks toward Allahabad and Benares (Banaras), or among the hills of Bundelkhand The rainfall varies from 30 to 44 in in the plains, increasing gradually toward the Himalaya The temperature in the hot season ranges from 86° to 115° F. and even higher in the shade. (E Ho ; X)

History.—If the present limits were slightly extended in either direction so as to include Delhi and Patna, the United Provinces would contain the area on which almost the whole drama of Indian history has been played. There lay the scene, known as Madhya Desa or "middle country," of the second period of Aryan colonization, when the two great epics, the "Mahabharata" and "Ramayana," were probably composed and when the religion of Brahmanism took form There Buddha was born, preached and died There arose the successive dynasties of Asoka, of the Guptas, and of Harsha. There ruled the Mogul for his most brilliant period at Agra and at Fatehpur Sikri There finally, at the crisis of the mutiny, British dominion was established in India.

The political vicissitudes through which this tract of country passed in earlier times are described under INDIA. *History* It will be sufficient here to trace the steps by which it passed under British rule. In 1765, after the battle of Buxar, when the nawab of Oudh had been decisively defeated and Shah Alam, the Mogul emperor, was a suppliant in the British camp, Lord Clive was content to claim no acquisition of territory Oudh was restored to the nawab with the exception of the two districts of Kora and Allahabad in the lower Doab which were handed over to the Mogul emperor for the upkeep of his dignity and expenses. Warren Hastings augmented the territory of Oudh by lending the nawab a British army to conquer Rohilkhand and by making over to him Allahabad and Kora on the ground that Shah Alam had placed himself in the power of the Marathas In 1775 he received from Oudh the sovereignty over the province of Benares Lord Wellesley in 1801 obtained from the nawab of Oudh the cession of Rohilkhand, the lower Doab and the Gorakhpur division, thus enclosing Oudh on all sides except the north In 1804, as the result of Lord Lake's victories in the Maratha War, the rest of the Doab and part of Bundelkhand, together with Agra, were secured from Sindia. In 1815 the Kumaon division was acquired after the Gurkha War, and a further portion of Bundelkhand from the peshwa in 1817. These new acquisitions, known as the ceded and conquered provinces, continued to be administered by the governor-general as part of Bengal. In 1833 an act of parliament authorized the appointment of a lieutenant-governor for the North-Western Provinces, as they were then styled. They included the Delhi territory (transferred after the mutiny to the Punjab) and also (after 1853) the Saugor and Narbada territories, which in 1861 became part of the Central Provinces. Meanwhile Oudh remained under its nawab, who was permitted to assume the title of king in 1819, until it was annexed in 1856 and constituted a separate chief-commissionership. Then followed the mutiny, when all signs of British rule were for a time swept away throughout the greater part of the two provinces. The lieutenant governor died when shut up in the fort at Agra, and Oudh was only reconquered after several campaigns lasting for 18 months. (*See* INDIAN MUTINY.)

In 1877 the offices of lieutenant governor of the North-Western Provinces and chief commissioner of Oudh were combined in the same person; and in 1902, when the name of United Provinces of Agra and Oudh was introduced, the title of chief commissioner was dropped. In 1920 the tract was created a governor's province. (X.)

Minerals and Agriculture.—Because of the loamy nature of the soil, few minerals of any kind are found, and the chief underground product is the abundant nodular limestone (*kankar*) which is used for road making. Iron and coal exist in the southern hills but not in paying quantities, and there are traces of old iron-workings in the lower Himalaya. The course of tillage comprises two principal harvests. the *kharif*, or autumn crops, sown in July and reaped in October or November; and the *rabi*, or spring crops, sown in October or November and reaped in March or April. The great agricultural staple is wheat, but millets, rice, barley and pulses are also largely cultivated. Speaking broadly, rice and oil-seeds predominate in the eastern and sub-Himalayan districts, millets and cotton in Bundelkhand and wheat in the greater part of the Gangetic plain. Sugar cane, condiments and tobacco are locally important, and a little tea is grown in the submontane districts of Almora Garhwal and Dehra Dun

Irrigation.—The Doab is intersected by canals drawn from the great rivers. The major productive works are the Upper and Lower Ganges, the Eastern Jumna and the Agra canals. The greatest work in the province and one of the greatest irrigation works in the world, is the Upper Ganges canal, which is taken from the river where it leaves the hills, some 2 mi above Hardwar In the first 20 mi. of its course this gigantic canal crosses four great torrents, which bring down immense volumes of water in the rainy season The total length of the main canal is 213 mi , navigable throughout and designed to irrigate 1,500,000 ac. The Lower Ganges canal is taken from the river at Narora, 149 mi below Hardwar After crossing four great drainage lines, it cuts into the Cawnpore and 7 mi lower down into the Etawah branches of the Upper Ganges canal. These branches are below the point of intersection, part of the Lower Ganges canal system. The irrigating capacity of this canal is 1,250,000 ac The Sarda canal, opened in 1928 to carry the waters of the Sarda into Oudh, was extended in 1941, making the total length of its main canals and branches 7,236 mi., one of the longest systems of its kind in the world, the area irrigated being more than 1,200,000 ac (including 200,000 ac of sugar cane).

Land Tenure.—Under British rule the system of land tenure was not uniform. In the Benares division, the land revenue was permanently fixed in 1795, on the principles that had been previously adopted in Bengal; and there a special class of tenants, as well as the landlords, enjoyed a privileged status. Throughout the rest of the province of Agra temporary settlements were in force, usually for a term of 30 years, the revenue being assessed at one-half the "assets" or estimated rental value. The settlement was made with the landholders or zamindars, who were frequently a group of persons holding distinct shares in the land and might be themselves petty cultivators. The privileged tenants were those possessing "occupancy" rights, defined by statute All other tenants were merely tenants-at-will. In Oudh, after the convulsion of the Indian mutiny, all rights in land were confiscated at a stroke; and the new system adopted was in the nature of grants to the talukdars, or great landlords, who were declared to possess permanent, heritable and transferable rights, with the special privilege of alienation, either in lifetime or by will, notwithstanding the limits imposed by Hindu or Mohammedan law.

On July 1, 1952, an act of 1951 abolishing zamindari took effect Compensation (eight times the annual income) went to 2,000,000 zamindars at a cost of £112,500,000, the 12,000,000 tenants holding their 60,200,000 ac. (83.3% of the total agricultural land) directly from the state

Manufactures and Trade.—The principal manufactures are those of sugar, metal and coarse cotton cloth. Ornamental metal-work is made at Benares. Among the factories on the English model are the Elgin and Muir cotton mills at Cawnpore (Kanpur), the Cawnpore wool mill, tanneries and leather factories, the Shahjahanpur rum distillery and the breweries at Mussoorie and Naini Tal There are also iron and brass foundries, lac factories and oil mills.

The export trade is chiefly confined to agricultural produce. The principal staples include wheat, oilseeds, raw cotton, sugar, molasses, timber and forest produce, dry stuffs, ghee and tobacco. The imports consist mainly of English piece goods, metalwork, manufactured wares, salt and European goods. The chief centres of trade are Cawnpore, Allahabad, Agra, Mirzapur, Benares, Meerut and Moradabad.

Railways.—The province is well supplied with railways. The main line of the East Indian traverses it from end to end, on both banks of the Ganges, connecting with Bengal on the one side and the Punjab on the other and linking up with the Great Indian Peninsula railway line at Allahabad, Agra and Cawnpore.

Besides this broad-gauge system, there is also a metre-gauge

nexus (the Bengal and North-Western, with its associate, the Rohilkhand & Kumaon), which serves the whole of the submontane tract and projects into Bengal, while it also joins with the Bombay Baroda & Central India railway at Muttra. The trade of the province thus has access to the sea at Bombay, Calcutta and Karachi.

Administration.—Under British rule the United Provinces were under the direction of a governor with an executive council and ministers The legislature had 118 members, to whom the ministers were responsible. After the transfer of power the legislature remained, pending the holding of elections under the constitution of the republic, which came into force on Jan 26, 1950. The first governor after the transfer of power was the poetess politician, Mrs Sarojini Nadu, who died in her term of office on March 2, 1949

The state has 48 districts, each under a collector and magistrate (called also deputy commissioner in Oudh and Kumaon) The supreme judicial tribunals are the high courts at Allahabad, with jurisdiction over the part of the state that was formerly Agra, and the chief court at Lucknow with jurisdiction over Oudh

UNITED STATES (OF AMERICA), THE, the foremost nation of the western hemisphere in the number and wealth of its people, and the second largest in area. It is situated advantageously in the temperate zone of the North American continent (approximately 24° 30′ to 49° N. lat.), and extends in a broad belt from the Atlantic ocean on the east to the Pacific ocean on the west (approximately 66° 57′ to 124° 45′ W. long.). On the north it is bordered by Canada, the boundary in the west being an arbitrary line at the 49th parallel and in the east largely a natural one formed by the Great Lakes. The eastern half of the southern boundary is naturally defined by the Gulf of Mexico, but in the west the nation is separated from Mexico by an oblique line following first the Rio Grande river and continuing afterward generally west-northwest across the highlands to the Pacific ocean

The eastern coast is separated from Europe by approximately 3,000 mi. of the Atlantic ocean which acts as a carrier for an enormous commerce between the two continents, but which, at the same time, gives the United States a degree of isolation from European affairs which contributed greatly to its independent growth and progress. The Pacific ocean which separates the United States from the oriental nations of the far east is wider, varying from 5,000–6,000 mi , but in the Hawaiian Islands the United States acquired possession of an important midway stepping stone

The United States consists of 48 separate and theoretically sovereign states joined together by a federal government to which the original 13 states delegated certain powers as outlined in the federal constitution adopted in 1787 and put in force in 1789. The official name "The United States of America" is in general usage shortened to "United States," the term being used in the singular instead of a plural sense. The total area of the nation is 3,022,387 sq mi. (2,974,725 sq mi., land only). Its population in 1950 was 150,697,361, or 50 6 per square mile. In 1940 the population was 131,669,275, or 44 2 per square mile; in 1930 it was 122,775,046 or 41.1 per square mile; in 1920, 105,710,620 or 35 5 per square mile. Outlying possessions with a total area of 597,237 sq.mi. had a population in 1950 of 2,955,450.

I. PHYSIOGRAPHY

Plan of Relief.—The primary features of the United States are. (*a*) a vast western highland covering a full third of the country, dominated by mountains of which the general trend is a little west of north, (*b*) a smaller and lower eastern highland south of the St. Lawrence river, trending north-east-south-west, roughly parallel to the Atlantic coast, (*c*) a broad interior plain sloping southward and interrupted by the smaller interior highland, and (*d*) a lowland belt bordering the Atlantic and the Gulf of Mexico.

Major Physiographic Divisions.—The eight major divisions are as follows, the order being determined by the numbering of the physiographic provinces on the map (p. 720) and in table pages 721 and 722: A,—the Laurentian Upland covers most of eastern Canada and only a small part of the United States south of Lake Superior; B,—the Atlantic Plain embraces the Atlantic and Gulf coastal plains; C,—the Appalachian Highlands extend from the St. Lawrence south-west to the Gulf coastal plain with an average width of 300 miles. D,—the Interior Plains are bordered east and west by the great highlands of the continent and partly enclosed on the north by the Laurentian highland, but west of that they extend north to the Arctic ocean. On the south these Interior plains give way to the Gulf coastal plain but not without a distinct descent. E,—the Interior Highlands are surrounded by plains, the Interior plain on the west and north, and the Gulf coastal plain on the east and south. F,—the Rocky Mountain System enters the United States from Canada and extends south to latitude 36°. This system carries the main continental divide and, while not bearing the highest peaks, affords the greatest mass of land at high levels on the continent. G,—the Intermontane Plateaux west and south of the Rocky mountain system, occupy approximately half a million square miles, most of it at high altitudes and half of it ribbed by mountains. H,—the Pacific Mountain System occupies a strip about 200 mi. wide along the Pacific coast, embracing several distinct ranges and important valleys. *See* map, page 720 and table, page 721.

Rivers and Harbours.—In a very general way the major divides follow the great highlands, hence the rivers entering the Atlantic between the St. Lawrence and the Gulf of Mexico are of moderate size and of little direct value to navigation. Their indirect value is great, however, because all their valleys were carved when the continent stood at a higher level. Subsidence of the land drowned the lower courses of streams, making estuaries and harbours as at New York, Baltimore and all the other Atlantic seaports. The Hudson was drowned to Albany and the Delaware to Trenton, permitting ocean vessels to reach Philadelphia. Chesapeake bay is the largest indentation thus made. One of its branches, the Potomac, is at sea-level as far up as Washington.

The St. Lawrence system embraces the five Great Lakes on the Canadian border. The divide limiting the drainage basin of these lakes on the west and south is not far from their shores, hence all tributary streams are short. But the mouths of these streams have likewise been drowned by the tilting of the basin in such a manner that the south-western shores of these lakes are being progressively submerged while the north-eastern shores are rising. Milwaukee, Chicago, Toledo and some other ports owed their original harbours to this cause. The extraordinary harbour of Duluth lies behind a sand bar which has cut off the western end of Lake Superior.

Five-twelfths of the United States (1¼ million sq.mi.), mainly in the Interior plains, drain to the Mississippi and its branches. These afford thousands of miles of navigable water, chiefly on the main stream and its tributaries from the humid east. The Ohio is the most navigated stream in America. New Orleans is a river city 100 mi. from the Gulf; it is a seaport only in the sense that sea-going vessels can reach it. Mobile and some other Gulf ports are on drowned valleys altered and supplemented by artificial works. A small estuary at Galveston is fronted by a broad sand reef on which the city stands.

The Mississippi river has received much attention on account of navigation and flood prevention. More than three-fourths of its water comes from three main streams, the Missouri, the Upper Mississippi (above the mouth of the Missouri) and the Ohio Their several contributions are approximately as follows.

	Drainage area (square miles)	Average discharge in second-feet	Percentage of total discharge
Upper Mississippi . .	171,500	127,000	18·27
Ohio . .	202,000	300,000	43·17
Missouri .	530,000	100,000	15 83
Entire Mississippi .	1,240,000	695,000	..

The Missouri drains the largest basin but, has the least rainfall, hence its volume is least Each year the Mississippi carries to the sea 340,500,000 tons of solid matter in suspension and 136,400,000 tons in solution. Erosion would thus reduce the level of the entire drainage basin by one foot in 6,000 years

West of the continental divide on the Rocky mountains are two long rivers, the Snake-Columbia in the north and the Colorado in the south, which traverse the full width of the Intermontane plateaux Other streams are short and the total amount of water reaching the Pacific is small in proportion to the great area drained. In this part of the United States, chiefly in the States of California, Nevada, Utah and Arizona, and in the adjacent part of Mexico, is a vast area too arid to drain to the sea, comprising 3 2% of the area of the continent or nearly a quarter of a million square miles. The Pacific shore, like the Atlantic, has suffered submergence, drowning the lower courses of most streams. Thus was made the harbour of Portland, Oreg., on Columbia river, 100 mi from the sea. The local subsidence that made San Francisco bay came at a point where the chief rivers of California break through the Coast ranges to the Pacific. Puget sound, with Seattle, Tacoma and other harbours, is similar to San Francisco bay San Diego, near the Mexican border, owes its harbour to the protection of a magnificent sand reef.

Atlantic and Gulf Coastal Plain.—South of New York, the continent slopes almost imperceptibly to the shore, beyond which the sea bottom continues the very gentle slope many miles, and then descends less gradually to the oceanic abyss. The line where this relatively rapid descent begins is the real edge of the continent and this margin of shallow sea bottom is the continental shelf. Within this margin is deposited most of the sand and mud carried down from the land. A large part of the ocean's life is concentrated on this shallow bottom where the water is relatively warm and food is abundant.

Repeatedly in late geologic time this border of the continent has stood lower, and also higher, than at present, thus broadening and narrowing the continental shelf alternately. The part of the shelf above water at any one time is coastal plain. All that is shown on the map (p. 720) as coastal plain has been continental shelf at a time so recent that its structure remains unchanged. The materials of its underlying strata are the same as those now accumulating beneath the adjacent shallow sea. Some of the sand, clay and ooze has been poorly consolidated into sandstone, shale or limestone. All beds dip faintly seaward, the older and lower ones passing seaward beneath the younger beds, so that the several formations appear at the surface in strips parallel to the coast, the lower beds outcropping farthest inland. As the beds offer unequal resistance to erosion and are unlike in their soil-making properties, the striped pattern of the geologic map is apt to be reproduced in the topography of the coastal plain.

Topography.—As the surface of the continental shelf is extremely flat, so also is the land nearest the coast, which has but recently emerged and lies too near sea-level to favour the cutting of valleys. The landward edge of the coastal plain was necessarily first to emerge from the sea. It is also the highest. For both of these reasons it is more deeply eroded and more completely dissected by small streams than is the seaward edge. In the southern States this inner edge is at places more than 700 ft. above the sea and has a relief of 300 to 400 feet. At places erosion has even made new lowlands or peneplams. Other things equal, the number and depth of valleys increase inland.

Where the underlying strata resist erosion unequally, a strong stratum may give rise to a cuesta, a ridge with a very gentle slope down dip towards the sea and a steeper slope cutting across the strong stratum and leading down to an "inner lowland" on the underlying weak stratum The effect on topography is to make the *belted coastal plain* wherein the stronger beds (usually sandy) make higher, rougher and less fertile belts and the weaker beds (usually clay, marl or "chalk") make belts of smooth, fertile lowland Thus central Alsbama has its well known "Black Belt" on the outcrop of the Selma chalk (Cretaceous) which erosion has reduced to a lowland with a rich black soil, famous for its cotton. Dipping seaward, the chalk passes under stronger sandy beds which are poor soil makers, hence the rich lowland is paralleled by a broad, now much dissected cuesta of poor upland. Another lowland and another upland follow but are less well known. Northern Texas has a similar belt, the "Black Prairie," along the western boundary of the coastal plain. It is likewise on a chalk outcrop and has on its seaward side an infertile cuesta. New Jersey has a similar lowland on the weak Raritan clays which outcrop along the landward edge of the coastal plain. From Trenton south-westward this low strip is followed by Delaware river. North-east from Trenton it is followed by the great railroads running from New York to Philadelphia.

Islands.—It will be observed that the coastal plain is broadest at the south and narrows toward the north The opposite is true of the continental shelf, indicating that the continent is now relatively depressed at the north and elevated at the south One effect of this is seen in the islands from New York to Cape Cod. These islands, Staten, Long, Block, Martha's Vineyard and Nantucket, are disconnected fragments of the coastal plain, parts of one or more cuestas whose corresponding inner lowlands are submerged. The low strip described across New Jersey is continuous with Long Island sound. The same weak clays underlie both.

Coastline.—Throughout the Atlantic and Gulf coast recent (not necessarily current) sinking is in evidence. From New England to Texas the smaller streams have estuaries, as the larger ones had also until filled by sediments. North of southern Virginia all the major streams crossing the coastal plain are drowned across its entire width. The numerous large estuaries from New York to North Carolina make that part of the coast extremely ragged or crenulated Sand reefs or barrier beaches form a nearly straight "outer coast" and these continue most of the way from Long Island to Mexico They are especially long and continuous along the coast of Texas where tides are weak

The peninsula of Florida is due to an uplift of the sea bottom on an axis almost at right angles to the outline of the continent Its southern third is so little above sea-level that valley cutting is all but impossible. Here are the vast Everglades (*q.v.*), swamps whose water surface is less than 20 ft. above the sea Its most valuable part is a low limestone ridge on the Atlantic side, bearing Miami and other winter resorts. On this ridge and a line of coral reef wrapping around the southern end of the peninsula was the now abandoned Florida East Coast railroad. The northern part of the peninsula has suffered some erosion. Its underlying limestone suffers solution, giving rise to many sinkholes, some of them clogged and making lakes of considerable size. Here are the largest deposits of phosphate rock in eastern United States

Mississippi Embayment.—In the vicinity of the Mississippi river the coastal plain is greatly widened, extending north in a pronounced embayment to southern Illinois. The greater part of this area is occupied by the alluvial plains, 40 to 80 mi. wide, of the Mississippi and its tributaries. At the south this plain merges with and includes the great protruding delta, the entire alluvial plain covering an area of nearly 30,000 square miles. A large part of it is subject to flooding, or would be if not protected by artificial levees. The breaking of the levees in 1927 allowed most of the area to be inundated, the river at Arkansas City, Ark., rising at one time to 60·5 feet. The natural levees are at places 15 to 20 ft. above the back swamps. Slopes of 5 ft. per mile from the

river are common Slopes of 10 and even of 12 ft. are known.

Piedmont and Blue Ridge Provinces.—Inland from the Atlantic coastal plain is a belt underlain mainly by very old rocks, much deformed, generally metamorphosed and resistant This belt extends from central Alabama northeastward into Canada, but the part to be described here terminates at the Hudson river Its greatest width in the south is nearly 200 mi., but north of the Potomac river it averages barely 60 mi This relic of the early Palaeozoic continent is marked now by a mountain range on its northwestern side. From southern Pennsylvania, where it is called South mountain, to southern Virginia, where it is called Blue Ridge, it is rarely more than 10 or 15 mi wide and from 1,500 to 3,000 ft. high In North Carolina and adjacent states it broadens to 70 mi and culminates in Mt Mitchell (6,684 ft), the highest point in eastern United States The range is interrupted by a short gap in southern Pennsylvania Northeastward from this gap it is known as the highlands of New Jersey and New York This part, being detached from the main range (Blue Ridge province) and contiguous with the New England province, which is largely of the same character, is considered a part of the latter From New England to southern Virginia the crest, as viewed from a distance, is gently undulating and is considered to be the remains of an uplifted peneplain preserved by the strength of the rocks, while weaker rocks on both sides have been reduced to a new and lower peneplain In western North Carolina the ancient mountains were not all worn down to the peneplain indicated by the crest farther north. Partly for this reason and partly because of greater recent uplift these mountains are several thousand feet higher.

Between the mountains and the coastal plain is the Piedmont province, most of it a low plateau sloping seaward, consisting in the main of the same rocks found in the mountains. Where the rocks of the piedmont and mountain belts are similar the existence of a newer and lower peneplain in the former and not in the latter is explained by the fact that the new peneplain developed first along the lower courses of streams flowing from the mountains to the sea It spread westward, its limit of advancement being the eastward slope of the Blue Ridge This newer peneplain is itself uplifted and dissected by revived streams. Much of the northern end of the Piedmont province in Pennsylvania and adjacent states is exceptional, consisting of softer Triassic rocks As these were more readily worn down and, as already pointed out, the continent in this latitude has been less uplifted, this part of the Piedmont province is lowland rather than plateau, though still distinctly higher than the coastal plain. Taken as a whole, the rocks of this province are not very good soil makers, but the position, especially of its northern part, favours intensive cultivation Parts of the upland farther south are adapted to fruit trees and an important cotton district in South Carolina is in this province.

New England Province.—The New England province is a broadened northeastward extension of the belts already described. It has the same rocks along with some younger Palaeozoics, generally deformed, metamorphosed and peneplaned Residual mountains rising above the general level to an altitude of 4,000 to 6,000 ft. are found in the Green mountain section of Vermont and Massachusetts and the White mountain section of New Hampshire and Maine. Between and around these mountains the upland level is generally a little above 1,000 ft, studded here and there with isolated residual mountains or "monadnocks," the original Mount Monadnock being in southwestern New Hampshire. This upland is an uplifted peneplain, itself dissected by sharp valleys since uplift The surface declines seaward to the "Seaboard lowland" and it is probable that newer and lower peneplains are here represented The coastal margin below a level of 500 ft has a rolling surface with wide open valleys in contrast with the narrow and steeper valleys that incise the plateau. The land below 500 ft also includes the broad valley of the Connecticut river carved from Triassic rocks and analogous in most ways to the low northern end of the Piedmont province With this valley included, the relatively narrow seaboard lowland contains the greater part of New England's population and industry

Elevation was followed by depression and the valleys are drowned. This is typically shown on the coast of Maine where the style of depressed coast line is quite different from that of the coastal plain because of difference in topography previous to drowning. Outlying islands, formerly hills or mountains of hard rock, are abundant there Harbours are numerous and fishing is favoured by this as well as by the broad continental shelf.

Unlike the Piedmont and Blue Ridge provinces, New England was severely glaciated, its mountains overridden and scraped by the continental ice sheet, and its surface generally covered by ice-laid drift abounding in boulders Some of its valleys are partly filled with sandy outwash. Both topography and the stony soil are unfavourable to agriculture The northern part of the province was long the great lumbering district of eastern United States One of the chief effects of glaciation was the dislocation of streams Drainage, in beginning anew, was obliged to fill many basins and cross many rocky ledges. Lakes and rapids, therefore, abound, the latter being a great source of power New England, with its poor soil, abundant water power and excellent harbours early developed manufacturing and commerce

The Adirondacks.—In its physical geography the Adirondack area in northern New York is much like northern New England, a combination of subdued mountains and hilly plateaux, all severely glaciated and abounding in lakes. Like the White mountains and New England coast it is much used as a summer resort. The state of New York has reserved large areas of forest.

Appalachian Ridge-and-Valley Province.—West of the Piedmont, Blue Ridge and New England provinces is a narrow belt of folded sedimentary rocks stretching from the St Lawrence valley to the Gulf coastal plain. The length is 1,000 mi and the width rarely 75 mi , more often half that amount Between New England and the Adirondacks it is very narrow In its present state this belt consists of alternating ridges and valleys, the former being parallel, even-topped and rarely 3,000 ft. high For the most part they are nearly straight and in line with the major belt but a zigzag pattern appears in Pennsylvania. The valleys occupy more than half the space Throughout its length the Palaeozoic sandstones, shales and limestones are folded and often faulted by great lateral compression which made mountains of great height. The ridges now seen are not those made by the folding Those lay far above the level of the present mountain tops Even the synclinal trough bottoms were above the present crests All were eroded away to a peneplain covering this and adjacent provinces At the time of its making it could not have been, at highest, more than a very few hundred feet above the sea The tilted strata came to the surface of this plain in parallel strips Later came a general rise of the whole Appalachian region and the limestones and shales were worn down to a new and lower level (often a peneplain) while the sandstones, being stronger, along with the hard rocks of the Blue Ridge province and the sandstone-capped plateau on the west, retained more nearly their former level. The tops of the even-crested ridges indicate the old peneplain somewhat uniformly worn down

The greatest breadth of this Ridge-and-Valley province is in Pennsylvania where it is almost 90 mi. From here to southern Virginia the eastern third or fourth is almost without ridges Its several parts from the Lebanon valley in Pennsylvania to the Shenandoah valley in Virginia are well known for their agricultural wealth. In this central portion the master streams cross the belt transversely, their longitudinal tributaries being developed on the softer outcrops In the northern section of the province, Hudson-Champlain valley, and again in the southern section, Valley of East Tennessee and neighbouring states, the main streams are longitudinal. In the latter case this probably came about by the headward elongation of the Tennessee river capturing the former streams which flowed from the Blue Ridge to the Ohio.

Appalachian Plateaux.—West of the Ridge-and-Valley province is a plateau of almost equal length with a minimum width of 35 miles at the south but more than 200 miles wide farther north. On the side toward the Ridge-and-Valley province, it is at least as high as the ridges already described, 2,000 to 3,000 ft., but it declines northwestward and is barely 1,000 ft. high where its edge approaches Lake Erie. Its rocks are almost horizontal, generally outcropping on the southeast in an escarp-

ment overlooking the adjoining valley of the folded province Except at the north end the rocks at the surface are Carboniferous and Permian Thick beds of strong sandstone are common and generally cap the hills. Soils, therefore, are generally not good They are least fertile at the south end where the sandstones are most dominant, and best at the north end where Devonian rocks form the plateaux and glaciation has left its heterogeneous drift.

The larger part of the province is almost or quite completely dissected by stream valleys. These may approximate 1,000 ft. in depth on the higher south-east side, but the relief diminishes toward the north and west Nevertheless the hilltops are about at the same altitude and the horizon is nearly level The Cumberland plateau at the southern end, mainly in Tennessee, is exceptional in preserving large patches of undissected upland on beds of strong sandstone In parts of the eastern margin the beds are mildly folded though not enough to develop the topography of the next province to the east. The elevation is less uniform than elsewhere in this province and the horizon less level As these are also places of greater height these districts are known as mountains, the Allegheny mountains in Pennsylvania, and the Cumberland mountains in Kentucky and Virginia, but these names are applied somewhat broadly, and without exact boundaries, to the deeply dissected eastern margin The Catskill mountains in south-eastern New York are like the adjacent plateau but covered by an additional thick plate of strong conglomerate now deeply and maturely dissected The plateau in New York, and to some extent in Pennsylvania and Ohio, was glaciated, leaving the hills and valleys less angular, leaving also many lakes and displaced streams, some of which in carving new valleys have made picturesque falls and gorges The main plateau ends at the north in an escarpment not far south of the 43rd parallel and 600 to 1,000 ft. high. West of Rome, N Y, this escarpment overlooks the lacustrine plain along Lake Ontario, a part of the central lowland. East of Schenectady the descent from the plateau is to the valley of Hudson river (Ridge-and-Valley province) Between these two cities, the descent is only to a lower bench of the plateau province In this bench Mohawk river has cut its valley connecting the two lowlands named As all strata here dip slightly southward, the valley of the Mohawk is a strike valley. It is the greatest avenue of travel and commerce between the Atlantic coast and the central lowland.

The glaciated northern portion of the Appalachian plateau is favoured agriculturally and is one of the leading dairy districts of the United States. The remainder of the province is almost co-extensive with the great Appalachian coal fields, 75,000 sq mi in extent As this area was never folded the coal remains bituminous. In the province to the east the folds were so high that the carboniferous beds, being uppermost, were almost wholly eroded away. Only in a few small spots were the synclines so deep as to leave the coal below the base level of erosion. Here the coal was metamorphosed to anthracite. The total original area of the anthracite fields was 484 square miles. In the central part of the plateau province are also the great Appalachian oil and gas fields

Interior Low Plateaux.—West of the southern part of the Appalachian plateaux is a lower plateau province, mainly in the States of Kentucky and Tennessee At its eastern edge it abuts against the western escarpment of the Cumberland plateau Here the lower plateau is 1,000 to 1,400 ft. high and scored by valleys between which the surface is little eroded The ragged escarpment of the Cumberland plateau rises 800 ft higher Everywhere the level of the Interior Low plateau declines toward Ohio river, near which in western Kentucky the uplands are little more than 500 ft high. Dissection by streams increases toward the west end where it is complete The upland level in most of the province, except in the north-west, is approximately that of the Lexington (Highland Rim) peneplain which covers much of the continental interior. It is developed here on Mississippian (Lower Carboniferous) rocks Two low structural domes were thus truncated, the Nashville in Tennessee and the Cincinnati anticline, partly in Kentucky Ordovician (Lower Silurian) limestones were exposed in each, affording excellent soils In Tennessee these soluble rocks were later cut down 500 ft. making the fertile Nashville basin, surrounded by steep slopes rising to the relatively barren Highland Rim The "Bluegrass Region" in Kentucky preserves, in the main, the general level of the peneplain but is overlooked on the east by the Cumberland plateau, and on the south by a narrow monoclinal rim remaining from the former dome In the central Bluegrass district are exposed the oldest rocks and the best soil-makers of the Cincinnati anticline. Western Kentucky embraces the south end of a great coal field with its centre in Illinois. Here is a broad, faint syncline in which the upper Carboniferous rocks were sufficiently depressed to escape the erosion that stripped them away from neighbouring areas. Here again, in western Kentucky, the soil is better

Central Lowland and Superior Upland.—The term lowland is not capable of exact definition As applied to north central United States it signifies that most of the area is not obviously much above the level to which streams can cut down

Within this great province, roughly one-fourth of the United States, the chief contrasts in topography are determined by glaciation The entire province may be divided into six sections Two of them were never covered by the ice, two of them were left after glaciation as relatively smooth till plains without lakes, two others were left with abundant moraines and undrained basins Referring to the accompanying map and table, the Great Lake section (12a) has a topography controlled in detail by its thick glacial deposits, though its large features betray the relief of the underlying rock as carved by pre-glacial drainage. Terminal and recessional moraines and outwash deposits, with moraine lakes and swamps, cover perhaps half of the area; the other half is till plains (ground moraine) and lacustrine plains The beds of all the Great Lakes, except Superior, follow belts of weak strata which were presumably lowlands in pre-glacial time and were deepened by glacial erosion As the ice front retreated northward from the Mississippi-St. Lawrence divide, lakes formed between the divide and the ice With further retreat of the ice these lakes expanded and merged, changing from time to time in shape, altitude and outlet but generally discharging into the Mississippi system. When the vanishing ice covered only the St Lawrence the lakes discharged for a time through Mohawk valley to the Hudson. As each newly discovered outlet lowered the lake levels the water was progressively withdrawn from the farther ends of the basins and the old lake bottoms at the heads of the lakes (south or west ends) were laid bare An important though minor part of this Great Lake section consists of these perfectly flat former lake bottoms The glaciation of this section was in the last, or Wisconsin, ice epoch and the surface has been little altered by erosion Lakes and swamps are beginning to disappear but stream systems are poorly developed. West of Lake Michigan, in this section, is the leading dairy district of the United States

The Western Young Drift (12b) in Minnesota, northern Iowa and the Dakotas is similar but with a smaller proportion of morainic topography It has also a smaller rainfall, so that forests are limited to northern Minnesota An important feature of this section is the great lacustrine plain of former Lake Agassiz in the valley of Red river. This valley was flooded when the retreating ice cap obstructed the drainage to Hudson bay The lacustrine plain (most of it in Canada) is now the greatest area of spring wheat production in America

The two sections already described are separated by the Superior Upland and the Wisconsin Driftless Area The former, as compared with the other sections, is higher, is less deeply covered with drift, has a larger number of lakes and vastly more swamp. Its rocks are mainly igneous and metamorphic pre-Cambrian. Topographically it is a peneplain, upraised, somewhat eroded, then glaciated This is an important part of the great area of northern pine forest Much is now cut-over land, only a minor part being valuable for agriculture. It contains the chief copper mines of eastern United States and the greatest iron mines of the world

South-western Wisconsin and small parts of adjacent States were missed by the several ice invasions though surrounded by a glaciated surface that extends 250 mi farther south. Probably at no one time did the ice close around it. The margin of the ice sheet

was divided into lobes following the great valleys. In the different ice epochs they came from different directions, at one time from the north-west, at another from the north-east, the areas covered by these different advances overlapping south of this Driftless Area. The southern and western parts of this area are limestone uplands rather deeply and at places sharply carved by erosion The northern part is mainly a lowland underlain by friable Cambrian sandstone covered by glacial outwash. With due allowance for the effects of different kinds of rocks on topography, this driftless area may be regarded as a sample of the topography that was elsewhere overridden by the ice It is not very different from that which is seen beyond the limit of glaciation in eastern Ohio or western Kentucky or central Missouri

Most of Illinois, Indiana and western Ohio have a drift cover remarkable for its small relief and distinguished by a total absence of lakes The flatness is not absolute, for the retreating ice front halted at various stages, building recessional moraines, a few of which have the distinctive topography of moraines, while others are barely visible, being made apparent only by their effect on drainage. The major streams have cut down moderately into this surface and tributaries are developing, but not much headway has been made except near the Ohio and the Mississippi A margin near these streams belongs to an older drift sheet (Illinoian) while most of the section was again covered by ice in the last (Wisconsin) glacial epoch. West of this section in Iowa and northern Missouri and parts of eastern Nebraska and Kansas, are the Dissected Till Plains, distinguished from the Till Plains east of the Mississippi by greater erosion. This difference results from the fact that the glacial mantle west of the Mississippi was spread in the Kansan glacial epoch and is the oldest glacial drift widely exposed in the country. Complete drainage is re-established; valleys now occupy fully four-fifths of the area. In the type of agriculture that distinguishes the central lowland (grains and domestic animals) the Till Plains and Dissected Till Plains are pre-eminent.

South of the latitude of Kansas City (39°) the central lowland (Osage section) was not glaciated It extends almost to central Texas in a belt nearly 200 mi wide. The underlying rocks dip gently west beneath the Great Plains syncline and away from the Interior Highland. As the surface slopes in the opposite direction the formations outcrop in parallel strips trending nearly north and south The stronger beds form cuestas with east-facing escarpments, some of them so eroded as to make hilly belts a few miles wide.

Interior Highland.—Surrounded by the lowlands of south-central United States is the Interior Highland Its northern and larger part consists of the Ozark plateaux on nearly horizontal though slightly domed rocks The rocks of its southern third are folded along east-west axes. Altitudes in the Ozark plateaux are generally less than 1,600 ft., being highest near the centre, but in northern Arkansas on the southern slope of the dome the strong sandstone beds of the upper Carboniferous are preserved in a plateau that is locally more than 2,000 ft. high and ruggedly eroded, making the Boston mountains. In south-eastern Missouri in the midst of the plateau stand the St. Francois mountains, composed of granite, rising no higher than the surrounding horizontal sediments which once covered all. These ancient granite mountains were buried by marine sediments and are now being exhumed. They are among the best examples of their class The Ozark province is one of the leading sources of lead and zinc.

The belt of folded structure in Arkansas and Oklahoma, the Ouachita mountains (15*b*) is essentially like the Appalachian Ridge-and-Valley province, the product of two cycles of erosion, with ridges on the stronger outcrops and intervening lowlands on the weaker rocks. The rocks of the Arkansas Valley (15*a*) are but mildly folded and although the stronger sandstones make either flat or sloping uplands the whole strip is less uplifted than its neighbours. This province has large supplies of coal. The Ouachita mountains have the famous Hot Springs of Arkansas and produce the novaculite (natural honestone) of the United States. In and near it also are important bauxite deposits.

Great Plains Province.—The vast area known as Great Plains is a north-south belt averaging about 400 mi. in width between the mountains of western United States and the lowlands of its centre. Its height at the base of the mountains is 5,000 to 6,000 ft. and at its eastern edge 1,500 to 2,000 feet. An eastward slope of 10 ft. to the mile is common. A part of this great area is literally plain, most of the northern third is peneplain and considerable areas on the borders, both in the east and west, are dissected into hills. All of it is semi-arid and the only trees are in river bottoms or on certain isolated mountains like the Black Hills. Most of it has good soil without the necessary water to take full advantage of the fertility. Perhaps a tenth part may be irrigated.

The flat portions of the province are best illustrated in the Llano Estacado (Staked Plains) of Texas and eastern New Mexico (13*d* on the accompanying map and table). Interrupted by the valleys of transverse streams these flats extend north to southern Nebraska and, in modified form, to the South Dakota boundary forming a belt known as the High Plains. These are remnants of a vast alluvial slope made by coalescing alluvial fans from the mountains. When the streams ceased their depositing habit and began again to erode, the eastern edge of the fluviatile deposit was first to suffer. In Texas the edge is retreating westward as a well defined escarpment, there being but a few miles between the flat upland and the lowland on the east. In Kansas and adjacent States the wasting edge of the former upland plain is represented by a broad belt of hills (13*e*). In Nebraska, a thick mantle of loess obscures the transition from high plains to central lowland. Between the belt of preserved high plains and the mountains, erosion was also more favoured, partly by original slopes, partly by the nature of the vegetation. Here (13*f*-*g*-*h*) the fluviatile mantle, where formed, was destroyed and the present landscape is one of varied relief. The South Platte, Arkansas and Pecos have broad terraced and well-farmed valleys, but north-eastern New Mexico and the adjacent part of Colorado is a region of plateaux, trenched by angular valleys and surmounted by various features of volcanic origin. The Edwards plateau at the southern extremity of the province (13*i*) is a limestone tableland almost as flat as the Llano Estacado but without the fluviatile mantle It is cut off on the south and east sides by the great Balcones fault which for 300 mi forms the inner boundary of the coastal plain. Streams are dissecting the plateau at the edges and have in part removed the same limestone from a large area just north of the Edwards plateau This hilly section in central Texas (13*k*) is in a stage of the erosion cycle intermediate between the youth of the well preserved plateaux and the old age of the lowlands on the north

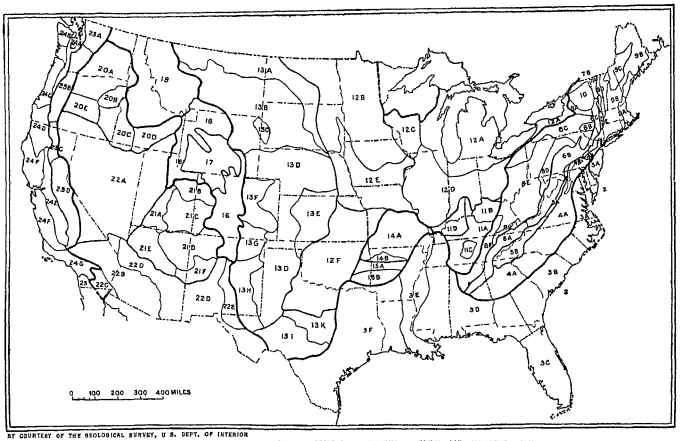
North of latitude 43° the Great Plains province is in large part upraised peneplain, though perhaps not all of the same cycle. Second in areal importance are the extensive gravel plains, some of them perhaps being remnants of a sheet similar in origin to that which covers the high plains. Others are simple stream terraces of Pleistocene age. Some of the streams, especially near the mountains, have valleys hundreds of feet deep and their tributaries have deeply dissected the upland. Isolated mountains are dome-like uplifts, the largest of which is the Black Hills, almost 100 mi long and 50 mi. wide, crossing the Dakota-Wyoming border. The structural uplift approximates 10,000 ft. but erosion has truncated the dome leaving the actual height less than 4,000 ft. above the plain on the east. The core of granite has thus been exposed at the top, while the strata outcrop in concentric ellipses, the stronger ones making ridges.

The northern part of the Great Plains province and a margin on the east (13*a*) was covered by the Pleistocene ice-cap leaving a strongly moraïnic topography in the Dakotas. The present course of Missouri river results from the obstruction of former drainage north-eastward to Hudson bay The ponded waters overflowing from basin to basin found the present south-eastward course. Its relative youth is shown by the small width of its valley (1 to 3 mi between bluffs) as compared with that of the Yellowstone and other tributaries.

Rocky Mountains.—As shown on the map (p. 720) the Rocky Mountain system is divided into four parts. The Southern Rocky Mountain province is a group of linear uplifts initiated

by east-west compression. The original folds were in large part levelled by erosion which thereby exposed the underlying granite, now revealed in north-south belts with a maximum width of 40 miles. Later uplift raised the general level to mountain heights but without sharp deformation. The old erosion surface was warped rather than folded, producing intermont basins. This later uplift enabled erosion to carve valleys in the granite and reduce the weaker rocks to lowlands. Commonly the granite belts are bordered by upturned sedimentary rocks, the several formations being of unlike strength, thus developing monoclinal *foothills* and valleys. Some large areas of granite 8,000 to 10,000 ft. high are plateau-like with a relief of only several hundred feet. These plainly represent a former lowland made by approximately peneplaning the first mountains. The largest of these tracts is South Park, 9,000 to 10,000 ft. high, west of Pikes peak. The same surface farther east and at many other places is carved into mountains whose summits approximate the same level. Looking across these crests, or over the undissected upland, Pikes peak is seen to rise as an isolated eminence 5,000 ft. above the level. It was a monadnock on the South Park peneplain. North of the Park and extending almost to Wyoming is the main crest of the Front range with many peaks 12,000 to 14,000 ft high. Along this entire line residual mountains rise clearly above a dissected plateau. Only a minor part of what is called "mountains" in the southern Rockies consists of these residual eminences. The greater part are carved from the uplifted peneplain. In the entire system, both north and south, most of the residual mountains have "alpine" features due to former glaciers. These are cirques and U-shaped troughs, often separated by steep and narrow crags. The San Juan mountains in south-western Colorado consist largely of volcanic rocks which once covered the area in sheets of relatively small relief. Later they were carved by water and ice into their present forms.

The Middle Rocky mountains, between the Wyoming basin and Yellowstone National park, consist of definite ranges in which structures and trends are clearly related. The axes radiate from Yellowstone park to the south, south-east and east. A long sickle-shaped arm whose eastern side is the Bighorn range almost surrounds the Bighorn basin. Of the group of ranges trending south, the Wasatch in northern Utah is outlined on the west by a great fault, the range on the upthrown side overlooking Great Salt lake on the downthrow. Meeting this range at right angles is the Uinta range which extends eastward forming the southern rim of the Wyoming basin.



Yellowstone park is a plateau of rhyolitic lava with an average height of about 8,000 ft., enclosed by mountains on three sides but open to the west where a rapid descent leads down to the Snake river (basalt) plateau. A single narrow belt of mountains north and east of the plateau connects those to the north and those to the south. The lava fills a basin probably 2,000 ft deep and appears to have conserved the heat revealed by geysers and hot springs. The hot springs are among the most extensive in the world and the geysers have no rival.

North and west of Yellowstone park the mountains (with few exceptions) are not in "ranges" in the usual sense of that word. Linear arrangement in agreement with structure is found to a limited extent, *e.g.*, in the Lewis range of Glacier National park, but in general the present relief does not suggest corrugation. Much the larger part of the area is a vast mountain upland divided only by stream valleys or by "Tertiary basins" in which the mountain surface has sagged. Generally the dominant ridges within a single view are of sub-equal height so that the horizon is not far from level. Altitudes between 6,000 and 9,000 ft. are prevalent. The Bitterroot mountains on the Montana-Idaho boundary are the upturned edge of a fault block tilted westward. Except for this deformation the surface is as described above. The history of the Northern Rocky mountains is much like that of those farther south. At similar altitudes glacial features are more pronounced. They are specially marked and picturesque in Glacier National park in the Front range near the Canadian boundary. The Selkirk and Bitterroot ranges are likewise noteworthy in this respect.

Wyoming Basin.—North of the southern Rocky mountain province is the Wyoming basin whose floor, almost 40,000 sq mi. in extent, is a plateau 6,500 to 7,500 ft. high and largely free from mountains. Beneath its horizontal Tertiary rocks, and rising through them here and there, are the older folded sedimentaries and granite, showing that the Rocky mountain system is structurally continuous. Within and around this plateau the drainage is strikingly out of harmony with structure and topography. Green, Yampa, Bighorn, North Platte and Laramie rivers all leave the basin by canyons 1,000 to 3,000 ft. deep which might be avoided by going around the mountains. Green river, especially, was once a favourite illustration of antecedent river. This assumes that the river was in its place before the mountains rose across its course. It is now believed that these streams are superposed, *i.e.*, they chose their courses when the mountains were buried by weak Tertiary rocks (since eroded away) lying on top of those that now make the basin floor.

Colorado Plateau.—South and west of the Rocky mountains is a region of 125,000 sq mi. whose underlying rocks are in the main horizontal and whose surface is tabular. In part it consists of wide-spreading plains at high altitude; elsewhere the plateau consists of tabular remnants between deep and branching canyons. In general the plateau abuts against the mountains on the north and east and ends in an escarpment overlooking lowlands on the west and south. The best known part of the province is the south-western section (*21e*) traversed by the Grand Canyon of the Colorado. This has a maximum depth of 6,000 ft. and a minimum width of less than 5 mi. from rim to rim. The conditions favouring canyons are all present in this province. Great altitude above base level, strong through-flowing streams and geologically recent uplift favour downcutting, while strong rocks and arid climate favour preservation of steepness. In this section the surface is on Permian limestone not deeply eroded. These rocks dip north under younger strata. At the same time the surface rises terrace-like over system after system until Eocene (Tertiary) beds and lava flows are found capping the high plateaux of Utah (*21a*) 9,000 to 11,000 ft. high, bounded, both east and west, by escarpments. Most of the strata underlying the high plateaux formerly extended southward over the plateau in which the Grand Canyon is cut. A mass of rock equal in thickness to the entire depth of the canyon was stripped from this plateau leaving a relatively low surface which was later uplifted. In other words, if the present canyon broadens and similar canyons develop and broaden until the entire plateau has been carried away to the depth of the present canyon bottom, then the streams of the present, newly inaugurated erosion cycle will have accomplished what was done once before. The same Eocene beds which appear in the high plateaux form a wide band on the northern margin, dipping northward until they turn up in the foothills of the Uinta range, and ending at the south in an escarpment. The general surface slopes agree with the structure. This is the Uinta basin (*21b*). South of it, and east of the high plateaux is the area of arid Canyon Lands (*21c*) deeply trenched by Colorado river and its tributaries, though its eastern margin in Colorado contains some broad fertile valleys. Farther south is the Navajo section (*21d*), like the Canyon lands but more arid and less canyoned because there are no mountains on the border to supply through-flowing streams. The Datil section (*21f*) on the south-east is largely lava-covered as is a very considerable area farther west (San Francisco mountain and vicinity) in the Grand Canyon section. Here also is the Zuni uplift, a dome like the Black hills.

Basin-and-range Province.—West and south of the Colorado plateau is a region marked by numerous small, roughly parallel mountain ranges separated by nearly flat detrital plains generally 4,000 to 5,000 ft. above the sea, but declining in altitude toward the Gulf of California. The northern half has long been known as the Great Basin and is the largest area of internal drainage in North America. The 100 or more mountain ranges divide it into an almost equal number of undrained basins. The hydrographic centres of some of these are marked by salt lakes; some others have playas, mud flats covered occasionally by a few inches of

MAP SHOWING PHYSIOGRAPHIC DIVISIONS OF THE UNITED STATES (SEE TABLE P. 721)

water. All are filled or veneered by detritus eroded from the mountains and deposited as alluvial fans. Such surfaces are nearly level and tend to rise until the basin is full. A few basins along the course of Humboldt river have been so aggraded with detritus as to establish through drainage which may reach Carson Sink or stop at Humboldt lake, according to season and weather. Many of the mountain ranges are 50 to 75 mi long and 3,000 to 5,000 ft. above the basins and trend approximately north-south. Trees appear only in exceptional spots. Some of the ranges are known to be upraised or up-tilted fault blocks. As there is a strong family resemblance among ranges, it is considered probable that faulting is at least the master process in the making of these ranges. The internal structures are complex showing that the rocks were strongly folded and (in the best known cases) peneplaned and lava-covered before faulting made the present mountains. In northern Nevada and southern Oregon the mountains were uplifted so recently that their origin by faulting is beyond doubt. Farther south some ranges are so old and eroded that their origin is not obvious. Some of the ranges bear evidence that the master faults were made before the peneplain, the present mountains consisting of the more resistant fault-blocks exhumed by selective erosion. Both of these types of mountains are present but the relative number of each, or even which is more numerous, is not yet known.

South of latitude 35° 30′, and extending from California to New Mexico, many of the intermontane basins are connected by through drainage or at least by continuous slopes on which water might flow to the sea if the rainfall were sufficient.

Columbia Plateau.—The surface of the Columbia plateau between the Northern Rocky mountains and the Cascades is made by flows of dark lava. These flows submerged an uneven surface of erosion, locally almost mountainous as may be seen in vertical section in the mile-deep canyon of Snake river between Idaho and Oregon. The Snake river basin east of the 115th meridian represents the simplest and most youthful phase of lava plains. Here the flat surface, 4,000 to 5,000 ft. high, remains as it was when the lava cooled, without erosion and only beginning to weather and to form soil. It is trenched only by the canyon of Snake river whose depth increases westward to 700 feet. Farther west, in south-western Idaho and south-eastern Oregon, there is more erosion. Near the State boundary the terraced valleys afford valuable irrigable land. The plateau in eastern Washington declines from nearly 3,000 ft. on the east to less than 500 ft. where Columbia river breaks through the Cascades. This northern section (*20a*) consists of older lavas, subjected to long erosion and having a rolling surface covered (at least in the east) with wind-blown soil. Here are the famous wheat fields of eastern Washington and western Idaho, cultivated by methods of "dry farming" by which a crop is raised in alternate years. In eastern Oregon near the middle of the province a group of mountains stood as an island in the floods of lava. Around these a later bulging raised the plateau surface to 7,000 ft., exposing it to greater erosion. This is the Blue Mountain section (*20b*). The rise lay across the course of Snake river which succeeded in cutting down as fast as the land rose, making a canyon 5,000 ft. deep.

Sierra-Cascade Mountains.—From Canada to southern California a continuous barrier of mountains separates the Pacific border from the Intermontane plateaux. The Sierra Nevada south of the 40th parallel presents to the Great Basin one of the highest and steepest mountain fronts on the continent. It is the escarpment of a great fault, or compound fault, west of which an old mountain range, worn down almost to a lowland, rose again with a westward tilt. Streams descending its long western slope have greatly increased its ruggedness by cutting gorges. These were later occupied by glaciers which deepened the valleys and steepened their sides. Yosemite valley is only an extra fine example of the typical glacial trough with its uneven floor whose basins retained lakes until filled by gravel, and its over-steepened walls notched at the top by tributary valleys, the "hanging valleys" which end in falls. These mountains are mainly of granite but in the northern half is a belt of folded and metamorphosed sedimentaries making the "Gold Belt" which has yielded a large part of California's output of gold.

Table Showing the Physiographic Divisions of the United States

Divisions	*Characteristics*
Laurentian Upland	
1. Superior Upland	1 Submaturely dissected, recently glaciated peneplain on crystalline rocks of complex structure.
Atlantic Plain	
2. Continental Shelf	2. Sloping submarine plain of sedimentation.
3. Coastal Plain	
a. Embayed section	3a. Submaturely dissected and partially submerged, terraced coastal plain.
b. Sea Island section	3b. Young to mature terraced coastal plain with submerged border.
c. Floridian section	3c. Young marine plain sandhills, swamps, sinks and lakes.
d. East Gulf Coastal Plain	3d. Young to old belted coastal plain
e. Mississippi Alluvial Plain	3e. Flood plain and delta
f. West Gulf Coastal Plain	3f. Young, grading inland to mature coastal plain.
Appalachian Highlands	
4. Piedmont Province	
a. Piedmont Upland	4a Submaturely dissected peneplain on disordered resistant rocks, moderate relief
b. Piedmont Lowlands	4b. Less uplifted peneplain on weak strata; residual ridges on igneous rocks
5. Blue Ridge Province	
a. Northern section	5a. Maturely dissected mountains of crystalline rocks; accordant altitudes.
b. Southern section	5b. Mature to subdued mountains of disordered crystalline rocks.
6. Ridge-and-Valley Province	
a. Tennessee section	6a Second-cycle mountains of folded strong and weak strata; valley belts predominating over even-crested ridges.
b. Middle section	6b. The same, but even-crested ridges predominate over valleys except on east side.
c. Hudson Valley	6c. Glaciated peneplain on weak folded strata.
7. St. Lawrence Valley.	
a. Champlain section	7a Rolling lowland, glaciated; in part covered by young marine plain.
b. Northern section	7b. Young marine plain with local rock hills
8. Appalachian Plateaux	
a. Mohawk section	8a. Maturely dissected, glaciated plateau; varied relief.
b. Catskill section	8b. Maturely dissected plateau of mountainous relief and coarse texture (glaciated).
c Glaciated Allegheny Plateau	8c. Mature glaciated plateau of moderate relief.
d Allegheny Mountain section	8d. Mature plateau of strong relief, some mountains due to erosion of open folds.
e Unglaciated Allegheny Plateau	8e. Mature plateau of fine texture, moderate to strong relief.
f. Cumberland plateau section	8f. Submaturely dissected plateau of moderate to strong relief.
g. Cumberland Mountain section	8g. Higher mature plateaux and mountain ridges on eroded open folds.
9. New England Province	
a. Seaboard Lowland	9a. Peneplains below 500 feet, past-maturely eroded and glaciated, few monadnocks.
b. New England Upland	9b Dissected and glaciated peneplains on complex structures; monadnocks.
c. White Mountain section	9c. Subdued and glaciated mountain masses of crystalline rock.
d. Green Mountain section	9d. Linear ranges of subdued and glaciated mountains and residual plateaux.
e. Taconic section	9e. Maturely dissected and glaciated mountains and peneplain on resistant folded strata.
10. Adirondack Province	10. Subdued mountains and dissected peneplain glaciated.
Interior Plains	
11. Interior Low Plateaux	
a. Highland Rim section	11a. Young to mature plateau of moderate relief.
b. Lexington Plain	11b. Peneplain on weak rocks; trenched by main rivers and locally dissected.
c. Nashville Basin	11c. Peneplain on weak rocks, slightly uplifted, moderately dissected.
d. Shawnee section	11d. Low, maturely dissected plateau with silt-filled valleys.
12. Central Lowland	
a. Great lake section	12a Maturely dissected and glaciated cuestas and lowlands; moraines, lakes, and lacustrine plains.
b Western Young Drift section	12b Young glaciated plain; moraines, lakes, and lacustrine plains.
c. Wisconsin Driftless section	12c. Maturely dissected plateau and lowland invaded by glacial outwash (Margin of old eroded drift included.)
d. Till Plains	12d. Young till plains, morainic topography rare; no lakes.
e. Dissected Till Plains	12e Submaturely to maturely eroded till plains.
f. Osage Plains	12f. Old scarped plains beveling faintly inclined strata; main streams entrenched.
13. Great Plains Province	
a. Missouri Plateau, glaciated	13a. Glaciated old plateaus; isolated mountains.
b. Missouri Plateau, unglaciated	13b. Old plateau, terrace lands, local badlands, isolated mountains
c. Black Hills	13c. Maturely dissected domed mountains.
d. High Plains	13d Broad inter-valley remnants of smooth fluviatile plains
e. Plains Border	13e. Submaturely to maturely dissected plateau
f. Colorado Piedmont	13f Late mature to old elevated plain
g. Raton section	13g. Trenched peneplain surmounted by dissected, lava-capped plateaux and buttes.
h. Pecos Valley	13h. Late mature to old plain.
i. Edwards Plateau	13i. Young plateau with mature margin of moderate to strong relief.
k. Central Texas section	13k. Plateau in maturity and later stages of erosion.

Table Showing the Physiographic Divisions of the United States—continued

Divisions	*Characteristics*
Interior Highlands	
14. Ozark Plateaux	
a Springfield-Salem plateaux	14a Submature to mature plateaux.
b. Boston "Mountains"	14b. Submature to mature plateau of strong relief.
15. Ouachita Province	
a. Arkansas Valley	15a. Gently folded strong and weak strata, peneplain with residual ridges
b. Ouachita Mountains	15b. Second-cycle mountains of folded strong and weak strata
Rocky Mountain System	
16. Southern Rocky Mountains	16. Complex mountains of various types; intermont basins.
17. Wyoming Basin	17 Elevated plains in various stages of erosion, isolated low mountains
18. Middle Rocky Mountains	18 Complex mountains, mainly anticlinal ranges, intermont basins
19. Northern Rocky Mountains	19 Deeply dissected mountain uplands, not anticlinal ranges, intermont basins.
Intermontane Plateaus	
20. Columbia Plateaux	
a. Walla Walla Plateau	20a. Rolling plateau with young incised valleys.
b. Blue Mountain section	20b. Complex mountains and dissected volcanic plateaux.
c. Payette section	20c. Young plateaus of prevailingly weak rocks; broad alluvial terraces. (Applies to northern part only.)
d. Snake River Plain	20d. Young lava plateau.
e. Harney section	20e. Young lava plateau, features of recent vulcanism; internal drainage.
21. Colorado Plateaux	
a. High Plateaus of Utah	21a. High block plateaux, in part lava-capped; include terraced plateaux on south side
b. Uinta Basin	21b Dissected plateau; strong relief.
c Canyon Lands	21c Young to mature canyoned plateaux, high relief.
d Navajo section	21d Young plateaux, smaller relief than 21c, into which it grades.
e Grand Canyon section	21e High block plateaux, trenched by Grand Canyon.
f. Datil section	21f. Lava flows entire or in remnants, volcanic necks.
22. Basin-and-Range Province	
a. Great Basin	22a. Isolated ranges (largely dissected fault blocks) separated by aggraded desert plains
b. Sonoran Desert	22b Widely separated short ranges in desert plains.
c. Salton Trough	22c Desert alluvial slopes and delta plain; Gulf of California
d Mexican Highland	22d. Isolated ranges (largely dissected block mountains) separated by desert plains
e. Sacramento section	22e. Mature block mountains of gentle dip; block plateaux, bolsons.
Pacific Mountain System	
23 Sierra-Cascade Mountains	
a. Northern Cascade Mountains	23a. Sharp alpine summits of accordant height; higher volcanic cones
b. Middle Cascade Mountains	23b. Generally accordant summits, higher volcanic cones.
c. Southern Cascade Mountains	23c. Volcanic mountains variously eroded, no very distinct range.
d. Sierra Nevada	23d. Block mountain range tilted westward, accordant crests; alpine peaks near east side.
24. Pacific Border Province	
a. Puget Trough	24a. Lowlands of diverse character; in part submerged.
b. Olympic Mountains.	24b. Generally accordant crests, local alpine peaks.
c. Oregon Coast Range	24c. Uplifted peneplain on weak rocks, dissected; monadnocks of igneous rock.
d. Klamath Mountains	24d. Uplifted and dissected peneplain on strong rocks; extensive monadnock ranges.
e. California Trough	24e. Low fluviatile plains.
f. California Coast Ranges	24f. Parallel ranges and valleys; on folded, faulted and metamorphosed strata, rounded crests of subequal height.
g. Los Angeles Ranges	24g. Uplifted fault blocks; alluviated lowlands
25. Lower Californian Province	25 Dissected west-sloping granite upland (in northern part).

North of Feather river the range changes completely. There is no evidence of uplift, only a piling up of volcanic materials from hundreds of vents. Lava flows, ash beds and cinder cones are of all ages from those that are fresh and shapely to others almost eroded away Mt Shasta with its beautiful cone (14,161 ft), and Lassen's peak, the only volcano in the country witnessed in action, belong to this southern section of the Cascades (23c) A little north of the Oregon boundary there is evidence that crustal uplift is added to volcanic accumulation Farther north the range owes its height more and more to uplift and less and less to the piling up of ejecta The volcanic cover gives out entirely in central Washington, north of which the Northern Cascade mountains (23a) consist of metamorphosed Paleozoic rocks and granite, intricately dissected into sharp peaks and ridges most of which, in a single view, rise to an almost uniform height The level thus determined varies from 6,000 to 8,500 ft., being gently arched. Above this nearly level horizon in both Oregon and Washington rise the isolated cones of extinct volcanoes 3,000 to 7,000 ft. higher. The best known are Mt. Rainier (14,408 ft.) in Washington and Mt Hood (11,245 ft) in Oregon. Crater lake in southern Oregon is the finest example of its class in America. It originated by the engulfment of the upper part of a volcano thus truncating the cone and leaving a pit 5 to 6 mi. in diameter at the water-level, which is here 6,117 ft high Above it the walls of the caldera rise 500 to 2,200 ft. and below it the basin is 2,000 ft. deep

Pacific Border.—The Pacific Border embraces a chain of coast ranges with long and important valleys between these and the Sierra-Cascade mountains. The most northerly range is the Olympic mountains (24b), not unlike the Northern Cascades but lower The Oregon Coast range (24c) is a gentle anticline of Tertiary beds, relatively recent in origin. It is succeeded on the south by the Klamath mountains, (24d), a range of long standing, consisting largely of metamorphosed Paleozoic rocks, once eroded down to a peneplain but uplifted again, locally as high as 7,000 ft , then deeply and ruggedly eroded. Most of the California coast is occupied by the California coast ranges (24f). These are relatively low mountains (generally between 2,000 and 4,000 ft.)

ranged in parallel ridges due largely to faulting of an earlier, much deformed and much worn down mountain belt Some broad valleys south of San Francisco are filled with late Tertiary sediments because of depression at that time. Still later the coast seems to have been depressed some 1,500 ft below its present level Shorelines etched against the mountain side are presented here and there at various levels between the sea and the 1,500 ft contour. As shown by these old shorelines, the depression that caused San Francisco bay is relatively recent.

Puget sound is the submerged northern end of a trough (242) 350 mi. long between the Cascades and the Coast range Its southern end is the valley of the Willamette, a southern tributary of the Columbia Some of the valleys in this long trough are agriculturally rich Commercially the region of the sound is favoured by its fine harbours and the four or more transcontinental railroads which these harbours have attracted The Great Valley of California (246) between the Coast range and the Sierra Nevada is 400 mi. long and 50 mi. wide In the upwarp of the adjacent mountain belts, this belt was bent down. As a consequence it was covered with the silt, sand and gravel washed from the mountain slopes. That deposition is still going on in the valley is evident from the habits of the two master streams, the Sacramento from the north and the San Joaquin from the south. These have small gradients and run between high natural levees; sandbars are abundant; at the head of San Francisco bay the two streams unite to build an extensive delta. The filling of the valley is mainly from the higher mountains on the east Deposition is in the form of alluvial fans which in the southern part have crowded the San Joaquin westward to the foot of the Coast range, the great alluvial fan of Kings river, extending across the valley, has cut off its southern third forming Tulare basin, partly occupied at times by a playa lake Here the climate is so arid that all inflow is evaporated and there is no drainage to the San Joaquin. Irrigation is highly developed, especially in the more arid southern half on the great alluvial fans. Fruits, nuts and raisins are the chief products.

The Sierra Nevada and the Great Valley extend south to latitude 35° beyond which there are ranges trending nearly east-west from the Mojave desert to the Pacific. The famous fruit-growing lowlands of California lie mainly farther south. The Gulf of California occupies a down-warped trough similar to the Great Valley In recent geologic time the gulf reached 150 mi farther north. This extension was cut off by the delta of the Colorado river and its waters evaporated. It is now the basin of the Salton Sink, still in part below sea level and known, where irrigated, as the rich Imperial Valley.

II. GEOLOGY

The surface of North America, like that of all continents, stands two to three miles above adjacent ocean floors and apparently has so stood during the 2,000,000,000 years of its recorded history. Variations from time to time in ocean basin capacity, in oceanic volume and in relief of the continent's surface have, however, produced great variations in the amount of continental surface emerging as land above ocean levels. Shallow seas comparable to Hudson bay (average depth 200 ft.) have repeatedly spread over large fractions of the North American continental platform, leaving their record in limestone, shale and sandstone sediments with entombed remains of the marine life of the time. Repeatedly, also, these shallow marine floodings have been withdrawn and the destructive processes of weathering and erosion from exposure to the atmosphere have attacked the land areas, destroying part of the earlier sedimentary record. Thus marine deposits made during the next time of flooding have come to lie unconformably on the eroded surfaces of older deposits, the unconformity being essentially the land surface at the close of the intervening time of emergence. Elsewhere, large areas remained above sea level and experienced only erosion while the marine transgressions were occurring.

None of the marine submergences duplicated any other, yet the deciphered history shows that the continent possessed certain recurring lineaments, the invading seas early taking possession of linear tracts (geosynclines), subparallel to the eastern, western and southern continental margins and lingering there when marine withdrawals were occurring. Other negative areas (epicontinental, epeiric shelf) were more briefly inundated and certain tracts (shields, geanticlines, positive areas, kratons) repeatedly, although not invariably, escaped even the maximum floodings.

These alternating experiences of the continental surface, largely constructional when beneath epicontinental or geosynclinal seas and largely destructional when exposed to the atmosphere, constitute the framework of its geological history. The correlation of successive similar events in widely separated regions is possible because of the concomitant progressive evolutionary changes which the embedded fossils, chiefly marine invertebrates, in the sedimentary rocks record.

Based on the stratified sediments and their fossils, on the interrupting unconformities and on evidence for successive times of mountain making (orogeny) and igneous activity, most geologists have adopted a classification of four great eras of earth history, subdivided into about 15 periods The terms for these divisions of earth history used herein are those commonly accepted in the United States and Canada.

The Pre-Cambrian Era.—This slightly awkward term springs from two facts. One is that Cambrian sedimentary rocks, the oldest in the record of the succeeding Palaeozoic era, are also the oldest rocks with a good record of abundant and varied organisms. Pre-Cambrian rocks have only very rare showings of organic structures. The other fact is that these pre-Cambrian rocks have been so tremendously disordered and metamorphosed by orogenic movements and so extensively intruded by igneous invasions from below that the number of years actually involved in making them is unknown. In most geological literature two such eras are specified, Archaeozoic and Proterozoic, but the distinctions of dominantly igneous origin of the Archaeozoic rocks and dominantly sedimentary origin for the Proterozoic rocks has proved in later studies to be inapplicable and the terms are being abandoned.

Theoretically the rocks made during this earliest era of earth history underlie all younger rocks Large areas also exist where there is no cover of later deposits, either because one was never made or because erosion destroyed any cover once existing In the United States all exposed Pre-Cambrian rocks belong to the second group and owe their present position to the occurrence of orogenic deformations in later geological time and the inescapable consequence of such uplifts: destructive erosion. Indeed, the largest of these areas, in northern Minnesota, Wisconsin and Michigan, has virtually lost the mountains themselves, only a few residual hills surviving the reduction of former massive ranges to a peneplained area of low relief. Traced northward into Canada, this tract about the west end of Lake Superior broadens into a great expanse of uncovered Pre-Cambrian rocks, occupying almost all of the provinces of Quebec and Labrador, and most of Manitoba, Ontario, the Northwest Territories and Baffin Island. This, the Canadian shield, is North America's greatest positive area. Some of it may never have been submerged in any later time; most of it has certainly had but slight and geologically short-lived sedimentary cover.

The Piedmont plateau and Great Smoky mountains, lying west of the Atlantic coastal plain, are portions of a smaller positive area (Appalachia) composed largely of Pre-Cambrian rocks The Adirondack mountains of New York, the Green mountains of Vermont and the White mountains of New Hampshire are, despite their magnitude as topographic eminences, only the Pre-Cambrian core rock of former ranges whose folded and faulted structures indicate the way such cores have been forced locally higher than the surrounding "basement" rocks still covered by perhaps a mile of later formations. Small and isolated outcrops of Pre-Cambrian rocks in the central lowlands and Great Plains are the St. Francis mountains of Missouri, the central part of the Black hills of South Dakota, tracts in southwestern Minnesota and adjacent South Dakota, the Wichita and Arbuckle mountains

of Oklahoma and the Llano uplift of central Texas In the Rocky mountain system many ranges possess exposed Pre-Cambrian core rock, the uplift and erosional uncovering of which is in general of later date than in the eastern occurrences noted Some basin range mountains, particularly in Arizona and adjacent California, are similar in this respect. The mile-deep Grand canyon of the Colorado was cut down into the Pre-Cambrian basement which here is under a thick plateau cover of flat-lying younger rocks.

Most of these ancient rocks have suffered great metamorphic alteration under repeated high compressions and temperatures during past orogenies. Prevailingly, the high-angle foliation of schists and slates, from growth of platy mineral crystals oriented at right angles to the lateral pressures, largely obliterated original stratification and possible organic records. Little success attended attempts at correlation of formations, orogenies and erosion cycles of widely separated regions. Even unravelling the stratigraphic succession in any one region is difficult The most nearly satisfactory classification is for the Canadian shield where four systems of sedimentary rocks and contemporaneous lava flows were deposited, each time of deposition being terminated by orogenic deformation and associated granitic intrusions, and each orogeny followed by erosion so long continued that the newly made mountains were virtually wiped off the face of the earth and a peneplain left truncating the profoundly altered roots of those vanished ranges Unconformably on such peneplaned surfaces were deposited the sediments of the next following submergence.

Later Pre-Cambrian rocks in the southern part of the Canadian shield record glaciation by an ice sheet nearly 1,000 mi. across Elsewhere and at other times, aridity seems recorded. Whatever organisms existed, as they assuredly did, were marine aquatic forms, little affected by climates of the land areas Seaweed vegetation that secreted calcium carbonate is on record. Animals allied to sponges, worms, corals and crustaceans existed but left very few fossil traces, chiefly because of lack of hard parts Abundant disseminated graphite in some Pre-Cambrian metasedimentary rocks is accepted as derived from organic carbon.

The pre-eminence of the United States in manufacture of steel is in part the result of the enormous Pre-Cambrian iron ore deposits (altered ferruginous sediments) of the Lake Superior region. The great native copper-mining district of the Keweenaw peninsula, Mich., is developed in lavas and conglomerates of late Pre-Cambrian age, the metal having been deposited in cavities by thermal water rising from deep-seated magma bodies.

Pre-Cambrian time was tremendously long. Perhaps three-fourths of all recorded earth history occurred before the Cambrian seas with their abundant population of marine invertebrates transgressed the continents Reckoned from the radioactive disintegration of uranium and thorium minerals of the oldest Pre-Cambrian igneous rock studied, their intrusion, cooling and crystallization occurred 2,300,000,000 years ago And the Pre-Cambrian rock which received the intrusion was already in existence.

The Palaeozoic Era.—The pattern for North American positive and negative areas for Pre-Cambrian time is known only in fragments and traces. The Palaeozoic record, however, is sufficiently well-preserved that generalized maps of the land and water areas of the continent may be made, not only for each of the six periods but for different epochs during the advance, the maximum spread and the retreat of each marine flooding. Four persistently positive areas are known The Canadian shield, nearly 2,000,000 sq mi in area, was the largest. It still exists with only Hudson bay submerging a relatively small part of it Appalachia lay along the Atlantic seaboard, reaching from the Canadian maritime provinces southwestward to Georgia and Alabama, and extending an unknown distance eastward beyond the present continental margin. Llanoria lay to the south and largely subsided during later time into the depths of the present Gulf of Mexico. Cascadia, along the Pacific coast, similarly vanished.

Parallel and close to the inner margins of these positive areas lay three geosynclines or repeatedly subsiding troughs, the Appalachian geosyncline where now are the Appalachian mountains, the nearly east-west Ouachita geosyncline across Oklahoma, Texas and northern Mexico, and the Cordilleran geosyncline reaching from the Gulf of California northward across Nevada, Utah, Idaho and British Columbia The thick and relatively coarse detrital sediments deposited in them (now exposed in eroded mountain structures) are in contrast with the much thinner, finer-textured and largely calcareous deposits made contemporaneously in the broad shallow epeiric seas of the continental interior. Obviously, the thick trough fillings of shallow water deposits record repeated subsidences in the geosynclines as aggradation continued The coarseness indicates derivation from closely adjacent positive areas Repeated risings in those land areas, either as mountainous uplifts or broad warpings, are also required to account for the enormous thicknesses of land waste in the trough sediments The Appalachian geosyncline received from 30,000 to 50,000 ft. of Palaeozoic deposits.

Cambrian Period.—During early Cambrian time, marine overlap on the continent was limited to the Appalachian and Cordilleran geosynclines. By the middle of the period, the sea had spread across the interior also and aquatic forms could pass from the Atlantic to the Pacific. At least 30% of the continent was then below sea level The dominant limestone and dolomite formations of the middle Cambrian Age were derived largely from calcareous tests and shells of inconceivable numbers of middle Cambrian marine invertebrates Late Cambrian time witnessed a gradual withdrawal of this epicontinental flooding but, for the first time, the Ouachita geosyncline appeared in the history.

This is a generalized statement of events, the like of which were occurring in other continents as well during the more than 70,000,000 years of Cambrian time. Minor fluctuations of the sea level and warpings of the continent make a more complicated history than can be outlined here The period was brought to a close by an almost complete emergence of all continents, perhaps because of a deepening of the ocean basins The newly exposed Cambrian deposits thereupon suffered some erosion before the return of the sea in the next submergence Because no mountain folding occurred in North America during this emergent interval and therefore erosion could not bite deeply into the new land, most of the Cambrian sediments survived to become buried later beneath Ordovician and younger deposits.

Cambrian time is noteworthy for the spectacular appearance in the fossil record of almost all invertebrate phyla. Evolutionary changes that occurred during the Cambrian provide us with "index fossils," certain species which lived only during the early, middle or late Cambrian. There were even more extinctions of old and appearances of new forms during the interval following the withdrawal of Cambrian waters and preceding the advance of the Ordovician seas

Ordovician Period.—The relatively shallow epicontinental seas, returning to inaugurate the Ordovician period, first entered the geosynclinal troughs, later spread from the arctic to the Gulf of Mexico in the greatest submergence the continent has ever had. The remaining land areas, scarcely half of North America's total area, were low-lying islands which determined the shifting outlines of embayments and supplied detritus, chiefly fine-grained, to their associated basins. Dominantly the basins received organically derived calcium carbonate, hence the large proportion of limestone and dolomite in the record.

Several low domes (Cincinnati-Nashville, Ozark, etc) with intervening saucerlike basins (Michigan, Illinois) were prominent in the Ordovician palaeogeography. The domes (or arches) were repeatedly submerged and emerged, as numerous discontinuities in their stratigraphic sequences show, while the basins were undergoing more nearly continuous sedimentation.

The fossil record tells of different immigrations at different times into the shifting epeiric seaways from bordering oceans.

Crustal disturbances in northern Appalachia, chiefly during the late Ordovician, culminated in close folding, thrust faulting, mountainous uplifts and volcanic activity Interbedding of lava flows and volcanic ash beds (bentonite) with Ordovician marine deposits are part of this record So are the coarse nonmarine clastics in the nearby Appalachian geosyncline.

Insofar as the deposits tell of climate, there could not have

been a zonation like that of the present earth for some coral species ranged in latitude from the southern United States north into arctic Canada and even Greenland Only wide and equably distributed mild temperatures of the epicontinental waters can account for this

Ordovician rocks have yielded immense quantities of petroleum and natural gas, in Ohio for a decade or so before 1900 and in Oklahoma and adjacent Texas beginning about 1920. Most roofing slate quarried in the United States comes from metamorphosed Ordovician shales in the northern part of the Appalachian geosyncline Most decorative marbles of domestic origin are secured from altered Ordovician limestones in the same great trough of sedimentation. The Illinois-Wisconsin-Iowa lead- and zinc-mining district is developed in mid-continent Ordovician sediments; the sulphide ores, however, postdating the host rock

Duration of the Ordovician period appears to have nearly equalled that of the Cambrian

Silurian Period.—The stratification of most Silurian rocks in the United States parallels that of the subjacent Ordovician formations. But the differences in fossil fauna below and above the contact indicate a considerable time of emergence (a hiatus or lost interval) when the Ordovician marine forms had been forced to retreat to already populated continental margins and were there crowded into intense competition for living room and food. Evolutionary changes in marine life during all such emergences were maximal, both in extinctions and in appearance of new forms.

The Silurian record, like the Cambrian and the Ordovician, tells of slow and irregular advance of the sea into the geosynclines and epicontinental areas, interrupted at least twice by emergences suggesting those greater ones which geologists use for delimiting periods The early Silurian transgression entered the United States along the Appalachian geosyncline and spread westward across part of the central lowlands and into the Great Plains along the Ouachita trough. By middle Silurian time, the sea had spread over the Great Lakes region and northward to reach the arctic, actually lapping over on parts of that great positive area, the Canadian shield In late Silurian time, restriction and dismemberment of the epicontinental seas left a relict "dead sea" in the Great Lakes region. In it, immense quantities of salt were deposited, along with much gypsum and associated marine sediments. This huge evaporation pan must have had a connection with the sea by which it became replenished at intervals with more salt water. By this time, also, the late Ordovician mountains above noted had been so reduced by erosion that the sea overlapped the disordered strata of their stumps and buried them beneath late Silurian sediments.

There is scarcely a more striking feature of any Palaeozoic period's history than that of the middle Silurian mid-continent archipelago of "coral" reefs. Dozens are known in outcrops and quarries of Niagaran (mid-Silurian) strata in Indiana, Illinois, Iowa, Wisconsin and Canada. Their wide range in latitude indicates the nonzonal character of the mid-Silurian climate, just as the late Silurian salt and gypsum record at least a local aridity.

In addition to the great salt reserves, early middle Silurian rocks along the Appalachian trough contain a sedimentary iron ore, basis of the Birmingham, Ala , iron-mining and steelmaking district.

The 30,000,000 years of Silurian time closed quietly in North America although in high northern latitudes of all continents, one of the great mountain-making events of earth history occurred. Vulcanism of late Silurian age occurred in Maine and adjacent Canada

Devonian Period.—The marine withdrawal and continental emergence, conventionally chosen for subdividing geological time, was incomplete in parts of the Appalachian geosyncline for the Silurian-Devonian interval, sedimentation and a faunal record bridging the gap left elsewhere by the unconformity between the two systems. Indeed, only this trough of sedimentation seems to have gone below sea level during the entire early Devonian. By the middle of the period, overflow had submerged the Great Lakes region and a much more extensive flooding had advanced southward from the arctic, skirting the Canadian shield and reaching the upper Mississippi valley. It also connected with marine water in the Cordilleran geosyncline and so remained until the end of the period. The eastern and western seas were joined across the continental interior briefly but long enough for mingling of arctic and low latitude organisms

By the middle of Devonian time, mountains were again growing in northern Appalachia, the early Devonian deposits deformed in their making but the late Devonian sediments unaffected. The tremendous quantities of coarse waste deposited in the adjacent Appalachian trough testify to the rapid growth of a lofty range

In the evolution of living forms, the Devonian probably ranks next to the Cambrian in importance for at this time begins the record of life on land and in fresh water. The first known air-breathing vertebrates (Amphibia) and a great variety of primitive fishes appeared The oldest known land plants, some with trunks 40 ft. long, are buried in middle Devonian nonmarine deposits of southeastern New York Favouring climates appear to have prevailed, both on land and on the northern shallow seas.

Mississippian Period.—All the familiar seaways of the continent, excepting the northern part of the Appalachian geosyncline, were occupied during this period, the invasion following the familiar plan of an early possession of the great troughs and a later shallow spreading over the continental interior The northern Appalachian geosyncline trapped great thicknesses of waste from renewed upbowing of the middle Devonian mountains but, like most of late Devonian sedimentation there, the subsiding trough was kept filled above sea level and the deposits were nonmarine. Erosion to the penultimate stage of peneplanation had preceded the Mississippian marine encroachments and the invading seas spread so widely over this lowland that their deposits lie in places on all older systems, even Pre-Cambrian. Apparently Appalachia and Llanoria were one continuous land mass, the sea with its fauna entering from the arctic, Pacific and western Gulf of Mexico. Hundreds of feet of limestones characterized the interior deposits; thousands of feet of more largely clastic rocks were laid down in the troughs adjacent to Llanoria and Appalachia. Either late in Mississippian time or early in the Pennsylvanian period, much crustal unrest occurred in these margining lands and the deformations were extended to sediments in the troughs Other unrest occurred in the interior, Upper Mississippian formations in Illinois recording eight successive brief withdrawings and returnings of the sea.

Mississippian time, 30,000,000 years long, saw the beginnings of that very extensive swampiness which, for an equal length of time, characterized much of the continent during the following period. Commercial coal of Mississippian age occurs in Virginia. A later mineralization was responsible for the Missouri-Oklahoma-Kansas lead- and zinc-mining district in Mississippian rocks

Pennsylvanian Period.—Except for mountainous Llanoria and Appalachia, the continent was a great flat lowland in opening Pennsylvanian time The habitually subsiding geosynclines first went below sea level but only the western one received marine deposits. The other two were filled as rapidly as they sank with waste from their high borderlands The Appalachian trough also received thick peaty accumulations made in immense swamps and now constituting the early Pennsylvanian coal beds of West Virginia and Alabama

In the middle Pennsylvanian, swamps had spread over much of the interior as well, and the enormous coal reserves of half a dozen central lowland states were being initiated. Repeatedly sea water inundated and was withdrawn from these swamps, leaving interbedded marine deposits and minor unconformities. Farther west, Pennsylvanian sediments are chiefly marine

Orogenic movements occurred in the United States, not only during initial Pennsylvanian stages but at different times and places throughout and at the close of the period Southern Oklahoma saw a northward thrusting from Llanoria into the Ouachita trough. Southwestern Texas and western Colorado had comparable deformations. These seem to have been forerunners of the enormous lateral squeezings of parts of the continent during the following period. Pronounced orogenies of late Pennsylvanian and

of Permian time occurred in most continents.

The great coal deposits, also made in other continents, bespeak a warm, humid, equable Pennsylvanian climate for most of the globe. The character of the plants and associated amphibians, insects, spiders and fresh-water clams and snails tells the same story. So do the high-latitude Pennsylvanian corals.

Permian Period.—Despite the orogenies noted, Pennsylvanian time passed into Permian without marked breaks of sedimentation in the geosynclines. It was not for long, however. By middle Permian time, the Appalachian trough had been completely filled and before the Palaeozoic era had closed, that incredible thickness of sediments (maximum, 50,000 ft.) had been crushed into longitudinal folds and thrust sheets of a great mountain range As a site of sedimentation, the geosyncline ceased to exist from that time on Lingering seas in Texas and New Mexico left a great limestone reef (Carlsbad) with adjoining salt pan lagoons and associated highly oxidized red sands and muds. Obviously the humid Pennsylvanian climate had been altered here to one of marked aridity. A "dead sea" finally came to exist in this region.

The Appalachian orogeny, styled a "revolution," culminated at the close of the period The 500 mi. of original width of the trough was squeezed into half of that. Restoration of the great folds indicates uplift of three or more miles The Ouachita geosyncline was also crushed from the south and the dominant folded mountain structures of Arkansas and adjacent Oklahoma were made. Without undergoing such marked orogeny, the Cordilleran geosynclinal region experienced considerable volcanic activity.

The greatest salt deposits of the world are in the Permian system. Associated gypsum and dune sand indicate an aridity exceeding that of today Not too surprisingly, another climatic consequence of the widespread emergence and uplift was glaciation on four continents, the vicinity of Boston, Mass , yielding a record for the United States.

As might be expected, great changes in the life of the earth resulted from these extreme geographic and climatic changes. The typical coal swamp plants were replaced by conifers and cycads. Reptiles took precedence over amphibians and among their varied forms was a group whose teeth, jaws and skulls foreshadowed the arrival of mammals in the Mesozoic era.

The Mesozoic Era.—The widespread mountain making, continental emergence, climatic rigours and biological changes of the Permian mark the close of the Palaeozoic era and the opening of succeeding Mesozoic time

Triassic Period.—The waning importance of Appalachia and Llanoria as positive areas and the elimination of their persistently subsiding bordering geosynclines left only the Cordilleran trough for marine sedimentation on the continent during the Triassic Interbedded with such marine deposits is much volcanic material. Eastward from this trough are interfingered nonmarine shales and sandstones, part of a great alluvial plain where now are the Rocky mountains, Colorado plateau and western Great Plains In the eastern United States, much of Triassic time was consumed in erosion of the newly made Appalachian mountains. Late in the period, tensional faulting made a series of elongated basins from North Carolina to Nova Scotia which were filled with nonmarine deposits and intercalated lava flows as rapidly as they were deepened At the close of the period, tilting and uplift gave this faulted region a mountainous aspect again.

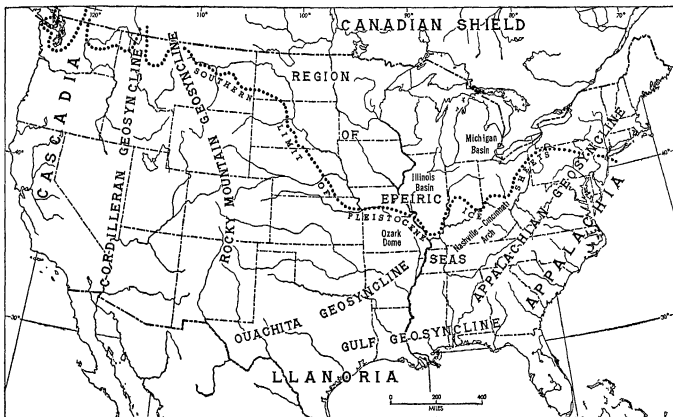
During the Triassic appeared the great conifers of the Arizona petrified forest, nearly 200 ft. high. The small beginnings of the greatest land reptiles, the dinosaurs, date from this time. The sea also had its reptiles, the plesiosaurs and ichthyosaurs. True mammals, however, are not known from Triassic deposits.

Jurassic Period.—The marine Jurassic overlaps on United States territory were from the Pacific, arctic and Gulf, only the former enduring for the entire period. The arctic invasion reached as far south as Colorado and Utah late in Jurassic time; the Gulf invasion (reaching north to Arkansas) did not begin until late in the period. Vigorous vulcanism, some of it submarine, accompanied marine sedimentation in the west. The arctic embayment was long and narrow. During the next period it developed into a new geosyncline which, in the end, suffered the fate of all subsiding troughs with excessively thick sediments; it was crushed into a mountain system, the Rocky mountains. Much Jurassic nonmarine deposition also occurred in the western states, thick dune sand formations dovetailing with marine beds.

Orogeny which deformed and metamorphosed the thick western sediments at about the period's end was accompanied by enormous granitic intrusions, reminiscent of similar Pre-Cambrian events. The California "Mother lode" and the Nevada Comstock lode date from this igneous activity It was modern stream waste from erosion of the Mother lode (placers) which gave California the gold rush of 1849

Nonmarine Jurassic deposits have yielded skeletons of almost unbelievably huge dinosaurs. A new reptilian venture was the pterosaur, a flying saurian The first birds appeared (no remains known in America at mid-20th century) and, most significant, the first mammals Small but agile, they lived successfully with the enormous dinosaurs in Wyoming and vicinity.

Cretaceous Period.—The last great submergence of North America marks the last period of the Mesozoic era The world over, Cretaceous seas probably submerged more continental surface than any previous flood had ever done. In a pulsatory fashion western Gulf water advanced northward to meet arctic water, forming a huge mediterranean sea by the middle of the period Marginal overlap by Atlantic and Pacific water indicated the final disappearance of Appalachia and Llanoria as borderlands The eastern Gulf reached north to the southern tip of Illinois.



This North American mediterranean occupied the Rocky mountain geosyncline and its sediments, mostly clastics from the late Jurassic mountains to the west, eventually obliterated the seaway and made another great alluvial lowland with swamps and sluggish streams. The late Cretaceous coal beds of this part of the United States are second only to the Pennsylvanian coal reserves.

Major orogeny again followed thick sedimentation in a subsiding trough. Thrusting from the west at the end of Cretaceous time compressed the weak Cretaceous strata and all subjacent rocks into uplifted folds and fault blocks along the entire length of this geosyncline. The making of the Rocky mountain system, coinciding with that of other systems on other continents, is therefore the time marker for closing the Mesozoic era and opening the Cenozoic.

In plant evolution, Cretaceous time saw the appearance of angiosperms (plants with covered seeds), dominant among land plants ever since. The reptilian horde reached its climax and gave place, following the Rocky mountain revolution, to mammals of almost all existing orders. From the variety of land-living organisms and the known palaeogeography, Cretaceous climates are judged to have been about as diversified as those of today

The Cenozoic Era.—Almost all landscapes of the world, whatever their character, are products of Cenozoic events. In the United States existing mountain ranges are Cenozoic uplifts, most of them along the axes of earlier orogenies. Most of them have summit flats or accordances, surviving from a peneplanation that had destroyed earlier deformative uplifts. Plateaus are broad uplifts with little deformation or are lava-flooded areas All volcanic cones of the country are Cenozoic growths The great drainage systems were outlined and developed during this era, as were all coast lines. The monotonous plains are determined by Cenozoic stream and coastal deposits, the debris derived from destruction of the late Mesozoic and early Cenozoic highlands All lake country in the northern states records a late Cenozoic ice-sheet glaciation. All soils and subsoils are Cenozoic in age. Almost all existing exposures of older rocks are the result of the vigorous erosion of Cenozoic time. Most of these features are consequences of crustal movements which produced at the maximum as emergent a condition and as great a relief as the continent has ever had.

The two Cenozoic periods are differentiated on the basis of climate, the coming of the "Ice Age" closing the Tertiary and inaugurating the Quaternary. Marine overlaps were limited to coastal lowlands and the lower Mississippi valley. Cenozoic formations therefore are largely nonmarine deposits occupying intermontane basins and piedmont areas. The life record thus is

GOODE BASE MAP NO. 209 COPYRIGHT BY THE UNIVERSITY OF CHICAGO. USED BY PERMISSION OF THE UNIVERSITY OF CHICAGO PRESS

GEOLOGICAL MAP OF THE UNITED STATES

largely of land animals and plants

The story of Cenozoic erosion, generalized, is that of the reduction of early highlands to worn-down peneplains which truncated the stumps of the newly made Rockies and the rejuvenated Appalachians and are recognizable even in the landscapes of the Appalachian plateaus and the central lowlands. Several times of renewed uplift interrupted this erosion and complicated the record with successive partial peneplains whose remnants today constitute accordant summits and steplike erosional flats at lower altitudes Rivers came to flow across such base-levelled surfaces without respect to hard or soft rocks below their valley bottoms In later uplifts many hard rock crossings have become spectacular water gap canyons in all areas of pre-Cenozoic folding and faulting. Other canyons are due to physiographic youth alone. Quaternary glaciers aided in the deep sculpturing of many western mountain ranges. The submerged continental shelf is notched by submarine canyons that seem to date from greatly lowered ocean levels at times during the era Elevated shore lines tell of other times when the ocean level was higher even than now.

Cenozoic deposits made by streams, wind and glacial ice and in lakes of closed basins are limited to favourable places, are very diverse in character, and in many cases are difficult to correlate. Particularly difficult has been the correlation of coastal marine sediments with the intermontane, although each class possesses a wealth of palaeontologic material.

The Gulf coast Tertiary rocks have been penetrated from below by a large number of cylindrical salt domes or plugs, the salt derived from older rocks and forced upward "like grease in a grease gun" (R. C. Moore) at weaker points. Another noteworthy feature of the Gulf coast is an actively subsiding structural and sedimentational trough across southern Louisiana, known from well logs to contain Tertiary sediments twice as thick as the Gulf is deep. It is pointed out as a modern geosyncline.

Cenozoic vulcanism was most marked in the Pacific border states where a row of towering cones surmounts the Cascade range and where the Columbia plateau of nearly horizontal lava flows covers about 200,000 sq.mi. Yellowstone park plateau is another well-known area of late Cenozoic vulcanism, its geysers testifying to hot rock at no great depth.

An orogeny which is still continuing began in middle Tertiary time Most of the displacements were by faulting and occurred (and still are occurring) along the west coast. A continental uplift throughout the country seems to have been contemporaneous with this

Of much significance to human occupation was the extensive continental glaciation in Quaternary time Canada, the source area of the great ice sheet, four times sent its marginal overflow south into the Great Lakes and central lowlands region, and four times was melted back in the as yet unexplained climatic oscillations. The interglacial stages had climates as mild as, even milder than, that of the present The Ohio and Missouri river courses were determined by these encroachments of glacial ice, the Great Lakes basins outlined and the cover of "drift" deposited over the region invaded. Outwash gravel and sand is traceable down the Mississippi to within 150 mi of the Gulf. Dust blown off these outwash tracts settled on drift-covered and driftless areas alike to constitute the fertile loess soils of Mississippi valley states. The ice-weighted part of the continent sank under its load and is still slowly rising from removal of that load Perhaps 1,000,000 years would measure the glacial experience. The entire era was about 60 to 70 times as long.

The present forests of deciduous trees were already outlined at the close of Mesozoic time. Grasses possessed the Cenozoic subhumid plains. Herbivorous mammalian evolution responded to the new food plants and carnivorous mammals swarmed to prey on the herbivores. Migration from other continents brought many kinds to North America, other kinds evolved here and spread to South America and the eastern hemisphere Land bridges for such migrations, presumably in high latitudes, were essential. Extinctions of earlier mammals went along with appearance and deployment of newer types. The Tertiary record of these faunal changes is wonderfully detailed and diversified Early human cultures arrived from Eurasia late in the Quaternary period, charcoal

and flint implements being far more numerous, however, than skeletal remains.

To the igneous and crustal activity of Cenozoic time are due most of the metalliferous veins of the western states. Some of the large oil pools of the United States are found in Cenozoic sediments as are also the Pacific coast coal deposits and the "bench" placers in California.

BIBLIOGRAPHY.—Two authoritative texts with special treatment of the geology of the United States are R C Moore, *Introduction to Historical Geology* (1949), and Carl O Dunbar, *Historical Geology* (1949) Moore's book is somewhat more elementary but gives considerable attention to the evolution of life Voluminous geological reports and many maps have been issued by the U.S Geological Survey, and the geological surveys of most of the states. All publications on North American geology are elaborately cross-indexed in a series of bulletins of the U S. Geological Survey. (J H. Bz)

III. CLIMATE

The climate, or average weather, within the continental United States exhibits a wide diversity although the country lies almost wholly within the "prevailing westerly wind" belt The characteristics of this generally easterly drifting air are changed as the air crosses the continent; these modifications are caused by changes of latitude and altitude, proximity to oceans and their currents, ascent and descent of the air over high mountain barriers and flow across the low smooth interior Further, surges of polar and tropical air masses, and the several types of "storms" add their effects to increase the variety of climates. The effectiveness of each of these so-called controls differs from one place to another. However, there are wide areas within which the characteristics of temperature, precipitation, etc., are nearly similar, but are distinctly different from the characteristics of adjacent areas

Based solely on moisture characteristics, especially with respect to effectiveness on either native or cultivated vegetation, C. Warren Thornthwaite divided the United States into five climatic provinces· superhumid, humid, subhumid, semiarid and arid These provinces are large, may extend through a latitudinal range of 10° or more and may be subjected to alternating flows of polar *v.* tropical or marine *v* continental air masses. Though each province may experience rather wide variations in temperature, except on the highest mountains, at least three months or more of the year have temperatures conducive to plant growth

Superhumid Province.—This is found along the north Pacific coast inland to the crest of the Cascade mountains Precipitation varies from more than 30 to more than 150 in Winter is the distinct wet season, the precipitation being caused by frequent "cyclonic" storms which enter the United States in this latitude and by ascent of the wind up the Olympic, Cascade and Coastal ranges. In the mountains much of the precipitation falls as snow which may be 10 to 30 ft deep by the end of March. Summer is predominantly dry, most stations receiving less than one inch each summer month. So little precipitation falls during the summer that there is a distinct water deficiency despite the enormous surplus that falls in the rest of the year. Temperatures are relatively high during the winter rainy season, averaging about 40° F. at sea level—much higher than to the east at the same latitude The highest summer temperatures rarely reach 90° F. and the warmest month is much cooler than it is inland. This is the cloudiest region in the United States, 140 to 200 days overcast, but there may be more than 80 clear days, mostly in summer, each year. It is foggy in the summer along the immediate coast and in fall inland from the coast. It has fewer than ten thunderstorms per year.

Humid Province.—All of the United States east of a line from Lake Superior to the Texas coast and scattered small areas in the western mountains have adequate rainfall varying from not less than 30 in to slightly more than 50 in. per year It is nicely distributed for plant growth because the rainier season is in summer This seasonal distribution is the result of convectional showers "cyclonic" storms and thunderstorms the latter occur between 25 (northern part) and 80 (central Florida) times a year. Much of the winter precipitation is snow north of the Ohio river where it may cover the ground from 40 days to nearly 150 days (northern Michigan) Along the Gulf coast snow is rare. The average annual temperature is less than 40° F. in northern Minnesota but increases to 70° F along the Gulf coast and 75° F in southern Florida. In January the averages are 5° F., 55° F., and 70° F respectively. Arctic and polar air may flow easily and rapidly across this area, bringing "cold wave" temperatures in its wake Coldest observed are about −50° F in Minnesota, −20° F. in Tennessee, 0° F in northwest Florida, and 40° F in Key West In summer there is little difference from the northern part (65° F, July average) to the southern part (80° F) Except for southern Florida and eastern Maine, temperatures of 100° F., or higher have been observed everywhere in this province There are about 100 frost-free days in the north and about 300 along the Gulf coast Killing frosts may occur each year down to central Florida. Frost may penetrate the soil to depths of four to six feet in the north In general, there are from 100 to 140 clear and 100 to 140 overcast days each year except in Florida Dense fog is present from 5 to 30 times a year, chiefly in winter Prolonged drought in summer is rare, but "hot waves," caused by flows of warm and very moist air from the Gulf of Mexico, are frequent During the autumn months devastating hurricanes, with wind speeds up to 125 m.p.h. and torrential rain, may strike Florida or, less commonly, the Gulf coast.

Subhumid Province.—This province is a belt 300 to 500 mi wide to the west of the humid province. The western boundary is a north-south line from mid-North Dakota through Texas. Its position is more distant from moisture-bearing winds from the Gulf of Mexico and the Atlantic ocean and thus has less precipitation than the humid province From east to west the annual totals decrease from about 30 to 18 in. along the Canadian border and from more than 40 to about 25 in. in southern Texas The higher temperatures and greater evaporation in the south make the precipitation less effective for plant growth than it is to the north Most of the precipitation falls during the warmer half year, it is largely concentrated in the late spring-early summer months which is especially important for cereal crops. The amount of precipitation varies considerably; Richard J. Russell stated that along the east side 1 year in 20 is semiarid, whereas along the western boundary 10 years in 20 are semiarid Temperatures are strikingly continental; *i.e.*, cold in winter and hot in summer, and are quite similar to those of the western edge of the humid province. Rapid and large temperature changes are a winter characteristic with blizzards and cold waves in the north and "northers" in the south of frequent occurrence. In North Dakota temperatures of −50° F have been observed and in central Texas, 0° F. Summer temperatures are nearly the same from north to south despite the 25° difference of latitude. Highest temperatures recorded have been between 105° and 115° F. The frost-free season is the same as the western part of the humid province.

Semiarid Province.—West from the subhumid province to the eastern slope of the Rocky mountains is an unbroken belt, 300 to 500 mi. wide, from Mexico into Canada and much of the area between the Cascade-Sierra Nevada ranges and Rocky mountains which is the semiarid province. Most of it is higher than 3,000 ft above sea level. Being still farther removed from moist Gulf of Mexico and Atlantic air, and with only dry air from the Pacific reaching this area, there is still less rain and snow than to the east In northern Montana the annual average is about 12 in ; this increases to about 25 in. in the south of Texas Over the Great Plains the rainy season is late spring-early summer from convection and cyclonic storms. Much of the rain falls as intense showers with as much as one-third the annual amount falling in a single day; contrariwise, two, three or four months may pass without any rain Hail is frequent in spring and early summer. In the intermountain area the precipitation is more evenly spread throughout the year Twenty to 40 in. of snow may fall during the winter, but ordinarily does not remain long. Chinooks, warm, dry air descending on the lee (east) slope of the Rockies, are fairly frequent during the winter. Lowest winter temperatures have varied between −66° F. (Yellowstone park) and 10° F. (Texas) and highest summer temperatures have

ranged between 105° F and 115° F

The great valley of California, while having the same amount of rain as the Great Plains and Rocky mountain areas, is quite different in that almost no rain falls from May to September. Winter rain is caused by cyclonic storms and by ascent over mountains Summer drought is so long that nearly all crops must be irrigated. Summer temperatures closely approach those of the arid province Killing frosts occur regularly each year Snow, hail and thunderstorms are almost unknown at low altitudes and fog is a frequent winter phenomenon.

Arid Province.—This province is largely restricted to parts of Nevada, Utah, Arizona, New Mexico, southeast California and some of southwest Texas Precipitation is generally less than 10 in per year, most of which falls as showers during the summer The smallest annual average is 1 35 in. per year, at Greenland Ranch, Calif. Summer temperatures are so high, and hence evaporation is so great, that no cultivated crops can be raised without irrigation July averages about 80° F. and highest temperatures are well above 110° F On July 10, 1913, 134° F., second highest in the world, was recorded at Greenland Ranch. Winter averages well above freezing though frost may be expected during at least two months each year More than 200 clear days and 60 or less overcast days occur each year; Yuma, Ariz., averages more than 280 days clear and more than 90% of the total possible amount of sunshine Because of the clear dry air it is not uncommon for midafternoon temperatures to be 40° to 50° warmer than those at sunrise.

BIBLIOGRAPHY.—An extensive tabulation of climatic data of the United States is contained in U.S. Weather Bureau publication, *Climatic Summary of the United States from Establishment of Stations to 1930, Inclusive*, (106 sections) and in *Climate and Man*, Yearbook of the Department of Agriculture (1941) numerous maps and graphs of many climatic elements are in three parts of the *Atlas of American Agriculture*, (U S Department of Agriculture): (1) "Frost and the Growing Season", (2) "Precipitation and Humidity"; and (3) "Temperature, Sunshine and Wind" Current climatological data will be found in the *Monthly Weather Review* (Washington). IV. FAUNA AND FLORA

Fauna.—The fauna of the United States includes most of the types of animals of temperate and arctic North America; indeed, when Alaska is included, the only conspicuous type missing is the musk ox of northeastern Canada, only lately extinct in Alaska and Eurasia. Only a very few properly tropical forms enter the limits of the United States. A few tropical frogs and snakes enter extreme southern Texas, and the American crocodile is present in southern Florida; the formerly more wide-ranging jaguar and ocelot are scarcely to be found north of the Rio Grande, though the common armadillo, which represents a distinctively South American group, has extended its range as far east as the Mississippi and north into Oklahoma. The treeless arctic tundra, where the subsoil remains frozen throughout the year, has striking circumpolar animals, like the lemmings, the ptarmigan, the arctic fox and the polar bear, all of which are little or not at all different from the corresponding forms in Siberia and Lapland The tundra proper enters the territory of the United States only in Alaska.

Excluding from consideration these tropical and arctic elements, the fauna of the United States falls into a well-marked pattern, associated with the more conspicuous botanical formations. The southeastern region of hardwood and pine, a rich mixed forest, extends somewhat beyond the Mississippi, contrasting sharply with the Sonoran desert of the southwest. The great central grasslands from the Dakotas to the Gulf contrast as sharply with the transcontinental coniferous forest at the north; this forest sends great "peninsulas" southward in the Appalachian and Rocky mountains, accompanied by northern types of animals.

The Rocky mountains, with other western ranges, supply a suitable environment for various rock-dwelling types, whose relatives are found in the mountain ranges of Eurasia. The more western ranges, the Cascades and the Sierra Nevada, and the Pacific coastal region, have a distinctive fauna with a mixture of unique elements and of forms related to those of the southeastern forest region The Pacific region has a varied flora, mostly sharply distinct from that of the southeastern forest

Arrangement of the account of the distribution of the fauna of the United States according to these regional provinces has the merit that it can be compared further with the distribution of insects and of other invertebrates, some of which may be expected to fall into the same patterns as the vertebrates, while others, with different modes or different ages of dispersal, will have geographic patterns of their own

The transcontinental zone of coniferous forest at the north, the taiga, and the tundra zone into which it merges at the northern limit of tree growth, are strikingly paralleled by similar zones in the Rockies and on Mt Washington in the east, where the area above timber line and below snow line is a kind of tundra, often with tundra animals like the ptarmigan and the white *Parnassius* butterflies, while the spruce and other conifers below timber line form a belt sharply set off from the grassland or hardwood forest or desert at still lower altitudes

A whole series of important types of animals spread beyond the limits of such regions or zones, sometimes over most of the continent. Aquatic animals, in particular, may live equally in forest and plains, in the Gulf states and at the Canadian border. Such widespread animals include the Virginia deer and black bear, the puma and bobcat, the otter and mink, and the beaver and muskrat. The distinctive coyote ranges over all of western North America and eastward to Wisconsin The larger gray wolf is found throughout the continent. The snapping turtle ranges from the Atlantic coast to the Rocky mountains.

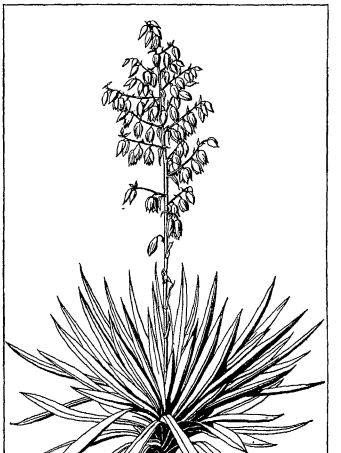
At the north, in the coniferous forest zone, the relations of animals with European or Eurasian representatives are numerous and this zone, often referred to under the Siberian name of "taiga," is essentially also circumpolar. The relations are less close than in the arctic forms, but the American moose represents the Eurasian elk, and beaver, hare, red fox, otter, wolverine and wolf are equally familiar as names for recognizably related animals on the two sides of the Atlantic Even some fishes, like the whitefishes (Coregonidae), the yellow perch and the pike, exhibit this kind of old world-new world relation A distinctively American element in this taiga assemblage is supplied by the Canada porcupine.

The hardwood forest area of the east and the southeastern pinelands compose the most important of the faunal regions within the United States. A great variety of fishes, amphibians and reptiles of this region have related forms in eastern Asia, and this pattern of representation is likewise found in the flora. This area is rich in catfishes, minnows and suckers. The curious ganoid fishes, the bowfin and the gar, are ancient types. The "spoon-billed cat," a remarkable type of sturgeon in the lower Mississippi, is represented elsewhere in the world only in the Yangtze in China. The Appalachian region is headquarters for the salamanders of the world, with no less than seven of the eight families of this large group of amphibians represented; no other continent has more than three of the eight families together. The eel-like sirens and amphiumas are confined to the southeastern states The lungless salamanders of the family Plethodontidae exhibit a remarkable variety of genera and a number of species centring in the Appalachians. There is a great variety of frogs, and these include tree frogs of the genus *Hyla*, whose main development is South American and Australian. The emydid freshwater turtles of the southeast parallel those of eastern Asia to a remarkable degree, though the genus *Clemmys* is the only one represented in both regions. Much the same is true of the water snakes (*Natrix*), the pit vipers (*Ancistrodon*) and various other genera of snakes (*Elaphe, Opheodrys*), though still others are peculiarly American. The familiar alligator is a form with an Asiatic relative, the only other living true alligator being a species in

DISTRIBUTION OF THE MAIN TYPES OF NATURAL VEGETATION IN THE UNITED STATES. THE THREE MAJOR NATURAL DIVISIONS OF VEGETATION ARE FOREST, GRASSLAND AND DESERT SHRUB. THE FOREST FALLS INTO TWO CLEARLY MARKED REGIONS, WESTERN AND EASTERN. THE WESTERN REGION COMPRISES SEVEN LARGE FOREST SUBDIVISIONS AND TWO SUBDIVISIONS OF WOODLAND. THE EASTERN REGION COMPRISES NINE FOREST SUBDIVISIONS. FOUR-FIFTHS OF THE FOREST WAS ORIGINALLY IN THE EAST. OF THIS ORIGINAL FOREST THERE REMAINS NOW ONLY ABOUT 10 PER CENT IN VIRGIN CONDITION, 50 PER CENT HAS BEEN CUT OVER AND NOW GROWN UP TO TREES OF SUFFICIENT SIZE FOR SAW LOGS OR COMMERCIAL USE, AND ABOUT 10 PER CENT CUT OVER OR DEVASTATED BY FIRE AND REDUCED TO BRUSHLAND

central China.

In its mammals and birds the southeastern fauna is less sharply distinguished from the life to the north and west and is less directly related to that of eastern Asia The forest is (or was) the home of the Virginia deer, the black bear, the gray fox, the raccoon and the common opossum. The wild turkey and the only lately extinct hosts of the passenger pigeon were characteristic. There is a remarkable variety of woodpeckers. The bird life in general tends to differ from that of Eurasia in the presence of birds, like the tanagers, American orioles and hummingbirds, that belong to South American families. Small mammals abound with types of the world-wide rodent family Cricetidae, and with distinctive moles and shrews.



The western grasslands merge by insensible degrees into semi-desert and desert toward the great basin and the Sonoran desert. Most distinctive of the grassland animals proper is the American bison, whose nearly extinct European relative, the wisent, is found in the forest. The most distinctive of the American hoofed animals is the prongbuck, which represents a family intermediate between the deer and the true antelopes in that it sheds its horns like a deer but retains the bony horn cores. The prongbuck is perhaps primarily a desert mammal, but it formerly ranged widely into the short-grass plains. Everywhere in open country in the west there are conspicuous and distinctive rodents. The burrowing pocket gophers are peculiarly American, rarely to be seen, but making their presence known by their pushed-out mounds of earth. The ground squirrels of the genus *Citellus* are related to those of central Asia, and resemble them in habit; in North America the gregarious prairie dog is a closely related form. The American badger, not especially related to the badger of Europe, has its headquarters in the grasslands. The prairie chicken is a bird distinctive of the plains region, which is invaded everywhere by birds from both the east and the west.

The Sonoran desert of the southwest, which may be regarded as including southeastern California, southern Nevada and Arizona, a corner of Utah, parts of New Mexico and extreme western Texas, is a paradise for reptiles Distinctive lizards abound, and the rattlesnakes, of which only a few species are found elsewhere in the United States, have their headquarters there. Among lizards the poisonous Gila monster is wholly Sonoran, though with a Mexican relative, Sonoran types range to the Pacific coast and northward in the great basin. Noteworthy mammals are the graceful bipedal kangaroo rats (almost exclusively nocturnal), the ring-tailed cat, a relative of the raccoons, and the peccary.

The Rocky mountains and other western ranges afford distinctive habitats for rock and cliff dwelling hoofed animals and rodents. The little pikas, related to the rabbits, live in the rock-slides at high altitudes as they do in the mountain ranges of eastern Asia Marmots live in the Rockies as in the Alps. Every west American range formerly had its own race of mountain sheep. At the north the so-called Rocky mountain goat lives at high altitudes—it is more properly a goat antelope, related to the takin of the mountains of western China. The dipper, remarkable for its habit of feeding in swift-flowing streams, though otherwise a bird without special aquatic adaptations, is a Rocky mountain form with relatives in Asia and Europe

In the Pacific region, the extremely distinctive frog *Ascaphus*, which inhabits icy mountain brooks, represents a family of frogs by itself, perhaps more nearly related to the frogs of far-off New Zealand than to more familiar types. The Cascades and Sierras form centres for salamanders of the families Ambystomidae and Plethodontidae second only to the Appalachians, and there are also distinctive newts. The burrowing lizards, of the well-defined family Anniellidae, are found only in a limited area in coastal California. The only family of birds distinctive of North America, that of the wren tits, Chamaeidae, is found in the chaparral of California. The mountain beaver, *Aplodontia* (which is not at all beaverlike), is likewise a type peculiar to North America, confined to the Cascades and Sierras; and there are distinct kinds of moles in the Pacific area.

The mammals of the two coasts are strikingly different, though true seals (the harbour seal and the harp seal) are found on both The sea lions, with longer necks and with projecting ears, are found only in the Pacific—the California sea lion, the more northern Steller's sea lion and the fur seal The breeding rookeries of the latter are now confined to the Pribilof Islands in the Bering sea The Pacific walrus is distinctively a creature of the

SPANISH BAYONET (YUCCA GLORIOSA)

This handsome species of yucca, with a woody trunk sometimes 8 feet high and 6 inches in diameter, is native to sand dunes and sea beaches from North Carolina to Florida and bears in October immense clusters of large creamy-white flowers. Many species are widely cultivated in mild climates as garden ornamentals

Alaskan coastal waters. The Atlantic species does not range south of Greenland.

The larger rivers of Florida are inhabited by the Florida manatee or sea cow, a close relative of the more widespread and more distinctively marine West Indian species.

Flora.—The dominant features of the flora of the United States are indicated by the terms forest, grassland, desert and alpine tundra. A coniferous forest of white and red pine, hemlock, spruce, jack pine and balsam fir extends interruptedly in a narrow strip near the Canadian border from Maine to Minnesota and southward along the Appalachian mountains Here may be found smaller stands of tamarack, spruce, paper birch, willow, alder and aspen or poplar. Southward, a transition zone of mixed conifers and deciduous trees gives way to a hardwood forest of broadleaved trees Thus forest, with varying mixtures of maple, oak, ash, locust, linden, sweet gum, walnut, hickory, sycamore, beech and the more southerly tulip tree, once extended uninterruptedly from New England to Missouri and eastern Texas. Pines are prominent on the Atlantic and Gulf coastal plain and adjacent uplands, often occurring in nearly pure stands called pine barrens. Pitch, longleaf, slash, shortleaf, Virginia and loblolly pines are most common Hickory and various oaks combine to form a significant part of this forest, with magnolia, white cedar and ash often seen In the frequent swamps, bald cypress, tupelo, white cedar and cane predominate. Pines, palmettos and live oaks are replaced at the southern tip of Florida by the more tropical royal and thatch palms, figs, satinwood and mangrove.

The grasslands occur principally in the Great Plains area and extend westward into the intermontane basins and benchlands of the Rocky mountains. Numerous grasses such as buffalo, grama, side oat, bunch, needle and wheat grass, together with many kinds of herbs, make up the plant cover. Coniferous forests cover the lesser mountains and high plateaus of the Rocky mountains, Cascades and Sierra Nevada. Yellow pine, Douglas fir, western larch, white pine, red cedar, lodgepole pine, several spruces, coast hemlock, grand fir, red fir and the lofty redwood are the principal trees of these forests The densest growth occurs west of the Cascade and Coast ranges in Washington, Oregon and northern California, where the trees are often 100 ft or more in height. Here the forest floor is so dark that only ferns, mosses and a few shade-loving shrubs and herbs may be found.

The alpine tundra, found in the United States only in the mountains above the limit of trees, consists principally of small plants that bloom brilliantly for a short season. Sagebrush is the most common plant of the arid basins and semideserts west of the Rocky mountains, but juniper, nut pine and mountain mahogany are often on the slopes and low ridges. The desert, extending from southeastern California to Texas, is noted for the many cacti, some of which grow to the height of trees; the joshua tree and other yuccas, creosote bush, mesquite and acacias.

The United States is rich in the variety of its native forest trees, some of which, as the species of sequoia, are the most massive known C. S. Sargent described 717 species, together with numerous varieties; G. B. Sudworth gave the names and geographical distribution of 1,177 species and varieties Of these, 182 are of economic value, either because of the timber and other useful products which they yield or by reason of their importance in forestry.

Besides the native flowering plants, estimated to comprise from 20,000 to 25,000 species, many hundreds of species, introduced from other regions—chiefly Europe, Asia and tropical America—have become naturalized. A large proportion of these are common annual weeds of fields, pastures and roadsides. In some districts these naturalized "aliens" comprise 50% or more of the total plant population. W. L. Jepson enumerated 4,019 species, of which 3,727 are native to the state (1,416 species endemic) and 292 (7%) naturalized from other regions. In the northeastern United States from Minnesota to Kansas and eastward the proportion of introduced species is much greater, *Gray's Manual of Botany* (1950) giving 7,135 species and varieties of which 5,912 are native and 1,223 (17%) introduced.

V. POPULATION AND SOCIAL CONDITIONS

Geographical Growth of the Nation.—The achievement of independence found the people of the United States owning the entire country from the Gulf of Mexico to the Great Lakes, excepting Florida, as far west as the Mississippi river; but the actual settlements were, with a few minor exceptions, confined to a strip of territory along the Atlantic shore The depth of settlement, from the coast inland, varied greatly, ranging from what would be involved in the mere occupation of the shore for fishing purposes to a body of agricultural occupation extending back to the base of the great Atlantic chain, and averaging about 250 mi Westward, beyond the general line of continuous settlement were four extensions of population through as many gaps in the Appalachian barrier, constituting the four main paths along which migration westward first took place the Mohawk valley in New York; the upper Potomac—upper Ohio river connections; the Appalachian valley through southwestern Virginia into Tennessee; and, around the southern base of the Appalachian system. Four outlying groups beyond the mountains—one about Pittsburgh, one on the Great Kanawha river in West Virginia, one in northern Kentucky and the last along the Cumberland river in Tennessee—constituted perhaps a 20th part of the total population of the nation. Finally, there were in 1790 about a score of small trading and military posts, mainly of French origin, scattered over the then almost unbroken wilderness of the upper Mississippi valley and region of the Great Lakes.

The returns for the 17 decennial censuses of the United States are summarized in Table I.

TABLE I.—*Population of Continental United States*

Census years	Land area in square miles	Population	Decennial increase per cent	Population per square mile	Number of aliens admitted in preceding decade*
1790	867,980	3,929,214		4 5	—
1800 . .	867,980	5,308,483	35 1	6 1	—

*Figures represent number of immigrant aliens admitted, that is, gross immigration; deducting emigrant aliens departed, the net figure for the decade ending in 1910 are 5,167,504; for 1910–20, 3,588,827, for 1920–30, 3,062,233; for 1930–40, 68,693, and for 1940–50, 878,640

†Estimated total up to 1820.

‡Revised figure

Except for the isolated military or trading posts, which always preceded the settlement frontier, the population advanced across the prairie region of the midwest with a practically solid front until halted for a time at the eastern edge of the Great Plains. The north and the south sections of the country started out with population growths in the decade 1790–1800 very nearly equal (36 5% and 33.7%); but in every succeeding decade before the Civil War the rate of growth in the north was greater, and that of the south less, than its increment in the initial decade. In 1790 the two sections were almost of equal population; by 1800, the population of the north was practically double that of the south.

In the decade 1890–1900 the increase of the south exceeded slightly that of the north, because of the rapid development of the southern states west of the Mississippi, but in general the increase of the two sections thereafter was nearly equal

The temporary halt in the western advance at the edge of the Great Plains was caused by the comparative aridity of this region and the discovery of more desirable agricultural valleys and mineral wealth in the mountainous sections and Pacific coast states of the farther west Population, therefore, leaped over these more barren regions and formed in isolated islands beyond. The first of these overland migrations, which were to become a feature of American life in that generation, was the migration over the Oregon trail to the Oregon country (beginning 1832), the Mormon emigration to Utah (beginning 1847) and the gold rush to California, by sea and the Overland trail (beginning 1848). By the treaty of 1848, ending the war with Mexico, a number of old Spanish settlements in the southwest were added to the population. Discoveries of mineral wealth between 1858 and 1880 in Colorado, Nevada, Idaho, Montana and Wyoming created other isolated areas of settlement in these states which spread gradually into the more attractive agricultural valleys of the mountains. Between 1880 and 1890 a large part of the Great Plains was taken up. But a small portion of this region was used for farming purposes until after 1900 when the system of dry farming (*q v*) became generally known Settlement was then rapid up to the entrance of the United States into World War I, more land being settled than could be held during the period of agricultural depression which followed. Similarly the population of the mountain states to a large degree followed the rise or fall of prosperity in the mining industries, but the growth of agriculture in these states proved to be a stabilizing factor.

Growth of the Nation in Population.—Between 1790 and 1940 the population increased from 3,929,214 to 131,669,275, and then to 150,697,361 in 1950. The increase during the decade 1940–50 was thus 19,028,086, or more in absolute number than the increase in any earlier decade in the census history of the United States. On a percentage basis, the 1940–50 increase amounted to 14.5%, as compared with 7 2% between 1930 and 1940. The rate of increase, however, was lower than that in any census decade except the one just preceding. (*See* Table I) In 1800, every important European country, even including Spain and Turkey, exceeded the United States in population; in 1950, only the Union of Soviet Socialist Republics had a larger population (unofficially estimated at something over 200,000,000). The population of the United States in 1900 was more than 14 times as large as in 1800, while the population of Belgium, then the fastest growing of the European countries, had only a little more than doubled during this 100-year period. Natural increase, however, which in Europe was the only important source of population growth, was only one of several factors in the United States. There were also very large additions to the population through immigration and much less important gains through the annexation of territory.

In 1790 there were about 600,000 white families in the United States. Speaking broadly, there were few very rich and few very poor. Both the social traditions and the religious beliefs of the people encouraged fecundity. The land was largely unsettled, and conditions for almost 100 years were such as to encourage migration westward and the establishment of new families under pioneer conditions. Labour was scarce and even on the farm it was difficult to obtain hired help. Under these conditions, large families possessed a direct economic advantage Between 1790 and 1830 immigration contributed relatively little to the population increase of nearly 9,000,000, since the total immigration during this period was only about 250,000. The population increase, which amounted to about 34 5% per decade, was therefore mainly the result of the excess of births over deaths.

From 1830 to the Civil War the rate of increase in the total population of the country continued at the same rate as in the preceding 40 years, the decennial increase for the entire 70 years averaging 34.6% and in no case falling below 32.7%. But after 1830 an increasing proportion of this increase was the result of immigration, the accessions, especially in the decade 1840–50 from Ireland and Germany, being enormous, and the total immigration in that decade rising to 1,427,337 as compared with 538,-381 during the preceding decade. It would appear, therefore, that while the natural increase of the native population was actually slowing up, the heavy and increasing immigration concealed this from view at the time In 1850, 9.7% of the population was foreign-born, and in 1860, 13.2%.

The ten years from 1860 to 1870 witnessed the operation of the first great factor which reduced the rate of national increase, namely the Civil War. The superintendent of the ninth census, 1870, computed the effects of this cause, first, through direct losses, by wounds or disease, either in actual service of the army or navy, or in a brief term following discharge; secondly, through the retardation of the rate of increase in the Negro element caused by the privations, exposures and excesses attendant upon emancipation; thirdly, through the check given to immigration by the existence of the war; and finally, through the temporary reduction of the birth rate, resulting from the withdrawal of perhaps one-fourth of the national militia during four years—to be a loss to the population of 1870 of approximately 2,515,000.

The rate of population increase declined steadily from 26 6% in the decade 1860–70 to 20 7% in the last decade of the 19th century, though from 1900 to 1910 there was a slight rise to 21.0% resulting chiefly from a large immigration of 8,795,386 (net, 5,167,504). In the next decade, 1910 to 1920, the rate of growth dropped to 14.9%, with a net immigration of 3,588,817, and in the decade 1920 to 1930, with a net immigration of 3,062,-133, it increased somewhat to 16.1%. Between 1930 and 1940, the rate of increase was only 7 2%, or less than half the rate recorded in any earlier decade. This abrupt change was due in part to the practical cessation of immigration and in part to a continued rapid decline in the birth rate Between 1940 and 1950, however, the trend was reversed and the absolute number of persons added to the population of the United States was larger than in any earlier decade, though the rate of increase, 14.5%, or more than twice the 1930–40 rate, was still a bit smaller than the rate recorded for any of the pre-1930 decades Increased immigration (878,640, net) contributed a little to this more rapid growth, but the increase resulted in the main from unexpected increases in the numbers of births.

The causes of the decline in the rate of natural increase in the later decades have been a subject of much speculation by sociologists The decline was not peculiar to the United States, but was shared by practically all the industrialized countries in the world. It was not to be expected, of course, that the rate established from 1790 to 1830 by a vigorous and fertile race, in a new country endowed with tremendous natural resources, would continue indefinitely. Early in the 1870s Francis A. Walker, superintendent of the 1870 and 1880 censuses, upon noticing that in spite of increased immigration the population in 1860 was only 10,000 more than it would have been if the rate of natural increase up to 1830 had been maintained, expressed the opinion that the decline might be due to the "competitive shock" of immigration and that immigration had actually contributed little to the final total population but merely substituted foreign stock for native stock. A more generally accepted explanation, however, is that the decline in the rate of natural increase was due to industrial development and urbanization and the complex forces dependent upon these two. While large families are not so much of an economic asset, even in rural areas, as they were in the early days, they are at least less of an economic burden on the farms, where there is still much work that can profitably be done by the growing boys and girls, than in the cities, where almost everything that is used or enjoyed must be paid for in cash.

One other factor sometimes brought forward as an explanation of the decline in the birth rate is the growing tendency toward late marriages which seemed to prevail among the ambitious and intellectual classes. There is not much statistical support for the assumption of such a decline, however, since the percentage of the population married showed an almost continuous, though not rapid, increase from 1890 to 1940. In 1890, for example, 56.8%

TABLE II—*Population of the United States by Regions, Divisions and States*

of the female population 15 years old and over were married, in 1910, 58·9%, in 1930, 61·1% and in 1940 (at the close of the depression decade), 61·0%. During the next decade, however, this percentage increased greatly, standing in 1950 at about 66·8%, the official figure being 65·5% of the female population 14 years old and over

Mention is made in this connection also of the increase in the extent to which women, especially married women, are employed in a wide variety of business and professional pursuits. Here again, however, the change was most marked in the decade between 1940 and 1950. (*See* Table XIII below).

The much more rapid growth in population between 1940 and 1950 has already been noted. This increase in rate of growth was mainly the result of an unexpected increase in the birth rate (following a substantial increase in the marriage rate) The birth rate in 1920 (based on registered births) was 23·7; by 1930 the rate had declined to 18·9 and by 1933 to a minimum of 16·6, with slight fluctuations during the rest of the decade. A rate of 17·9 was recorded in 1940 The increases from that time on were rather rapid, with a high point of 21·5 in 1943 and then 23·3 in 1946, and a maximum of 25·8 in 1947, from which time to 1950 there was only a small decline. During the same period the death rate had gone down from 13·0 in 1920 to 11·3 in 1930; 10·7 in 1940, and 9·6 in 1950; and by 1946 there had been an appreciable resumption of immigration, the net immigration during the last five years of the decade ending July 1, 1950, amounting to more than 750,000

The birth rates and death rates prevailing in the United States from 1939 to 1950 are presented in Table III, together with the

TABLE III—*Vital Rates for the United States*

Year	Birth rate*	Death rate*	Marriage rate	Divorce rate
1939	17·3	10·6	10·7	2·9

*Rates per 1,000 of the population, based on registered births and deaths.

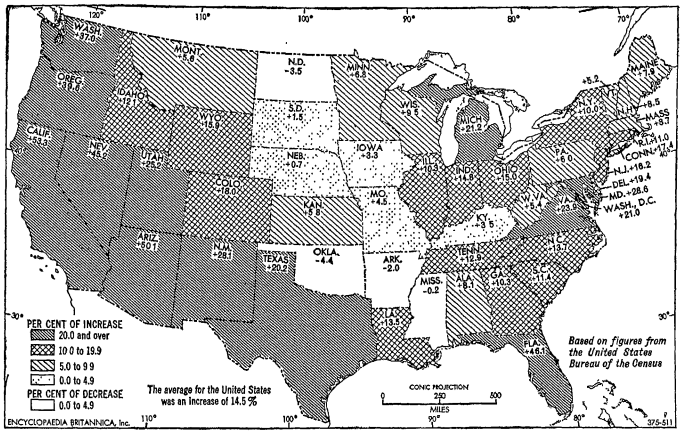

FIG. 1.—PER CENT OF CHANGE IN TOTAL POPULATION, BY STATES. 1940 TO 1950

closely related rates for marriages and divorces The total number of births in 1939, including an adjustment for underregistration, was 2,390,000; and the average for a number of years preceding was even smaller. By 1943, however, the number of births had increased to 3,209,000, followed by figures smaller by 200,000 or 300,000 in the next three years, then by the record number of 3,986,000 in 1947, or nearly 80% above the number recorded in 1933 (2,243,000), and around 3,700,000 in 1948, 1949 and 1950 The number of deaths, on the other hand, remained at about the same level, being 1,433,000 in 1939, 1,652,000 (the maximum) in 1945, and falling back to 1,467,000 in 1950.

While the population of the United States as a whole made unexpectedly large gains between 1940 and 1950, these gains were not by any means uniformly distributed over the country. Table II presents the population figures for 1940 and 1950, by states (grouped into divisions and regions), with rates of increase for the decade 1940–50 and for the preceding decade, 1930–40.

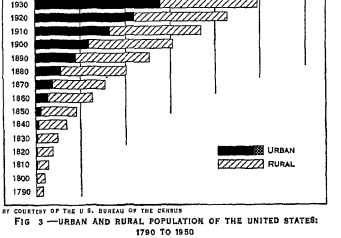
The total numerical increase between 1920 and 1930 was 17,064,426, of which again a very large fraction took place in the industrial states of the middle Atlantic and east north central divisions, New York recording a gain of more than 2,000,000, and Illinois and Michigan gains of more than 1,000,000 each. California, with an increase of 2,250,390, or 65.7%, showed the largest gain for any individual state, while Florida, with an increase of 51 6%, showed the next largest relative gain. Since the highest probable gain from natural increase, even under conditions existing in 1920, was less than 15%, it is obvious that gains such as those recorded for California and Florida must have resulted mainly from migration from other states.

The increase in the population of continental United States between 1930 and 1940 was 8,894,229, or 7.2% (as compared with 17,064,426, or 16 1%, between 1920 and 1930) While the contribution made to this increase by those states usually classified as industrial states was considerable, it was decidedly less in proportion to the total than in the three or four decades immediately preceding.

Two of the states showing the most significant increases between 1940 and 1950 were California and Florida; both had had heavy increases for several decades, largely because of in-migration from other states. Every state except Mississippi, Arkansas, Oklahoma and Idaho showed a higher rate of increase between 1940 and 1950 than in the preceding decade; and in many states, especially in the west, the current rate was two or three times the rate between 1930 and 1940. In California the absolute increase in population amounted to 3,678,836; and in four other states, New York, Texas, Michigan and Ohio, to

BY COURTESY OF U S BUREAU OF THE CENSUS

FIG. 2.—CENTRES OF POPULATION, 1790–1950



more than 1,000,000. Among the regions the increase was most rapid (40 9%) in the west, next (13.3%) in the south, with the north central (10.8%) and the northeast (9.7%) following.

The percentage increases during the decade ending in 1950 are indicated, by states, on the accompanying map of the United States (fig. 1). This map serves, incidentally, as a good indicator of the trends of internal migration within the United States, most of states with the black shading being states to which there was extensive movements of population from other parts of the

country between 1940 and 1950.

Centre of Population.—In 1790 the centre of population was located 23 mi E of Baltimore, Md, thus emphasizing the fact that the settlements were largely in the extreme eastern part of the country's area and also suggesting that the population was about evenly divided between the north and the south By 1850 the centre had moved westward about 260 mi. to a point 23 mi S E. of Parkersburg, W Va. By 1940 it had moved 320 mi. farther west, still following closely the 30th parallel, and was located 2 mi. S E. of the village of Carlisle, in Sangamon county, Ind The movement of the centre of population from 1790 to 1940 is shown on the accompanying map (fig 2)

Urban and Rural Population.—In 1790 the population of the United States was almost entirely rural and supported directly from the soil. There were no large cities, and no industry of importance other than agriculture. There were only two cities with

BY COURTESY OF THE U S. BUREAU OF THE CENSUS

FIG 3 —URBAN AND RURAL POPULATION OF THE UNITED STATES: 1790 TO 1950

The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition

more than 25,000 inhabitants, and only 24 places with more than 2,500. And it was not until toward 1820 that the largest city (New York) passed the 100,000 mark In 1850 there were 26 cities of over 25,000, including one with more than 500,000 and five others with more than 100,000 In 1910 there were 50 cities with more than 100,000, including three with more than 1,000,000, and in 1940 there were 92 cities of over 100,000, including five with over 1,000,000.

Table IV shows the urban population and the number of urban places on selected dates from 1790 to 1950. The figures given for urban population in 1940 and earlier years represent the number of inhabitants living in incorporated places (cities, boroughs, villages and, in some states, towns), supplemented by small areas classified as urban under special rule in states where there were many large population aggregates not incorporated as cities or villages. For 1950 a new definition of urban population was set up including, in addition to the incorporated places of the earlier

TABLE IV.—*Total and Urban Population of the United States*

Census year	Total population	Urban population		Number of urban places of		
		Number	Per cent of total	100,000 or more	25,000 or more	2,500 or more
1790	3,929,214	201,655	5.1	—	2	24
1820	9,638,453	693,255	7 2	1	5	61

1910	91,972,266	41,998,932	45 7	50	228	2,262
1940	131,669,275	74,423,702	56.5	92	412	3,464
1950*	150,697,361	96,440,548	64	106	477	4,270

*The definition of urban population was expanded for use in the 1950 census, as explained in the text. The 1950 figure given in the table (96,440,548) is a semifinal figure obtained by assuming that the proportion urban in the final population was the same as in the preliminary,

definition, 397 unincorporated places of 2,500 or more and the thickly settled suburban area, or "urban fringe," around all cities of 50,000 or more—these additional areas having an aggregate population of about 7,500,000 The rural population was in all cases that part of the total which was not classified as urban.

Up to 1830 the percentage of the population urban increased very slowly, which means that the growth of the urban population was little more rapid than that of the rural Between 1830 and 1840 the percentage urban in the country as a whole increased from 8.8 to 10 8, or by not quite one-fourth

TABLE V.—*Cities of 500,000 or More: 1950*
(Population for 1950 based on a preliminary count)

Washington, D C	797,670	663,091	134,579	20 3
Boston, Mass.	790,863	770,816	20,747	2 6
San Francisco, Calif.	760,783	634,536	126,227	19 9
Pittsburgh, Pa	673,763	671,659	2,104	0 3
Milwaukee, Wis.	632,621	587,472	45,279	7 7
Houston, Tex	594,321	384,324	209,807	54 6
Buffalo, N.Y	577,908	573,005	1,493	0 3
New Orleans, La	567,257	494,537	72,720	14 7
Minneapolis, Minn.	517,277	492,370	24,907	5 1
Cincinnati, O	500,510	455,610	44,900	9.9

In many individual states, however, the increase during this decade was much greater, the percentage urban in 1840 in some cases doubling that in 1830

Between 1840 and 1850 the percentage urban in the country as a whole increased from 10.8 to 15.3, or by nearly one-half This relative increase was exceeded in several of the older states, including Maine, New Hampshire, New Jersey and New York, but the most notable increases in urbanization during this period were in some of the newer states.

In the state of Ohio, for example, the percentage urban increased from 5 5 to 12 2; in Indiana, from 1.6 to 4.5; in Illinois, from 2 0 to 7 6; in Michigan, from 4.3 to 7.3; and in Missouri, from 4.3 to 11.8.

By 1850, settlement was well under way in most of the states which later attained a high percentage of urban population, and after that date the trend of the percentage urban in the country as a whole was less affected by the expansion of the settled area, or by the beginning of urbanization in the newer states, than it was in the decades preceding 1850.

In 1930 there were 21 states in which more than one-half of the population was urban. The census dates on which these states were first shown to have more than one-half of their population living in urban territory may be of some significance as indicating the geographic progress of urbanization over the country. Massachusetts and Rhode Island were the first of these states, their population being returned as more than 50% urban in 1850. New York was added to the list in 1870; New Jersey in 1880; Connecticut in 1890; and in 1900, Pennsylvania, Illinois and California. At the beginning of the 20th century, therefore, there were only 8 states in which the population was more than one-half urban. In 1910, New Hampshire, Ohio, Maryland, Colorado and Washington were added to the list; in 1920, Indiana, Michigan and Delaware; and in 1930, Wisconsin, Missouri, Utah, Florida and Oregon, though the percentage urban in Oregon had declined in 1940 to 48.8.

It is possible to compare the proportion urban in 1950 with that in 1940 and earlier on the basis of the 1940 definition, under which the urban population in 1950 would have been around 88,900,000, or 59.0% of the total On this basis it would appear that the rate of urbanization which had prevailed up to 1930, when the population was 56.2% urban, had not been resumed.

This notation is supported by the fact that the 1940–50 increase in the urban population on the 1940 basis was only 18.7%, as

TABLE VI—*Population of the U.S. by Colour, Nativity and Sex* (Figures for 1950 are based on the tabulation of a small sample)

Subject	1950	1940	Per cent of increase	Per cent distribution	
				1950	1940
Colour and Nativity					
Total	150,697,000	131,669,275	14·5	100·0	100·0
White	135,215,000	118,214,870	14·4	89·7	89·8
Native white	125,068,000	106,795,732	17·1	83·0	81·1

Sex ratio	98·1	100·7	—	—	—

compared with 14·5% for the total population.

The urban trend from 1790 to 1950 is shown graphically in the accompanying chart (fig. 3), which not only indicates the rapid increase in the relative importance of the urban population from 1860 to 1930, but also shows effectively that for the major part of the nation's history it has been dominantly rural. Incidentally, this chart also helps visualize the increase in total population over 160 years.

Large Cities.—Table V gives the population of the 18 cities which had more than 500,000 inhabitants in 1950, with comparable figures for 1940. Only five of these cities showed a percentage increase above that of the United States as a whole, the largest absolute increase, amounting to nearly 500,000, being made in Los Angeles

Racial Composition.—The population of the United States in 1950 comprised 135,215,000 white persons, 14,894,000 Negroes and 588,000 persons of other races, mainly Indians, Chinese, Japanese and Filipinos The white population thus represented 89·7% of the total and the Negro population, 9·9%, leaving for the minor races (*i.e.*, those of minor statistical importance) only 0·4%. The percentage Negro had declined steadily from 1790, when it was 19·3, to 1890, when it had reached 11·9; from 1890 to 1930 there was a slower decline to 9·7 on the latter date, followed by slight, but hardly significant increases in the two following decades, to 9·8 in 1940 to 9·9 in 1950 The percentage white, of course, increased as a result of the decline in the proportion Negro, since the total of the "minor" races had never exceeded 0·5%.

The population of the United States included, in 1950, only 10,147,000 foreign-born white, as compared with 11,419,138 in 1940. There was thus an actual decrease of 11·1% in this class, which may be compared with an increase of 17·1% in the native white population The distribution of the population of the United States by colour and nativity is shown for 1950 and 1940 in Table VI.

There were significant changes in the geographic distribution of the Negro population, especially after 1910, resulting from an extensive migration of southern Negroes to northern (and western) industrial centres. The percentage of Negroes of the population of the middle Atlantic states, for example, increased from 2·2 in 1910 to 4·6 in 1940, and in the east north central division, from 1·6 in 1910 to 4·0 in 1940 In the state of Michigan, taken alone, the increase was even more rapid, from 0·6% in 1910 to 4·0% in 1940, and 7·0% in 1950 Of the total population of Illinois in 1950, 7·3% was Negro, as compared with 4·8% in 1940, and 1·9% in 1910 Similar increases occurred in other industrial states and even greater relative increases in some important industrial cities.

The number of American Indians returned in the census year 1940 was 333,969 or practically the same number as in 1930. These figures may be compared with 265,683 in 1910, the last census prior to 1930 in which special effort was made to secure complete enumeration of all persons having any considerable proportion of Indian blood. The number of persons returned as full-blood Indians in 1930 (153,933), however, was only slightly larger than the 150,053 returned in 1910. These figures would indicate that most of the increase had been in persons of mixed Indian blood Because of the difficulty of identifying these latter or of establishing the dividing point at which such persons should be counted as Indians, it was difficult to get thoroughly dependable counts of the Indian population, especially in those states where the Indian population had become largely intermingled with the white.

Foreign White Stock.—Under the classification "foreign white stock" the bureau of the census includes foreign-born white persons and persons with one or both parents foreign-born In 1940 this classification included slightly more than one-fourth of the population, the number having decreased from 39,845,798 (or 32·5% of the total) in 1930, to 34,576,718, or 26·4% of the total in 1940 The foreign white stock in 1940 comprised 11,419,138 foreign-born white and 23,157,580 natives of foreign or mixed parentage; the latter, in turn, comprised 15,183,740 with both parents foreign-born; 5,267,140 with father foreign-born and mother native, and 2,706,700 with mother foreign-born and father native. It may be noted that all of these figures are smaller than corresponding figures for 1930. The distribution of the foreign white stock in 1940 by country of origin is shown in Table VII

TABLE VII—*Foreign White Stock by Country of Origin: 1940*

Country of origin	Total	Foreign-born	Native of foreign or mixed parentage			
			Total	Both parents foreign	Father foreign-born	Mother foreign-born

In terms of contribution to the total foreign white stock, Germany ranked first, with 5,236,612, or 15 1% of the total, and Italy second, with 4,594,780, or 13 3% of the total. It may be noted, however, that the number of Germans of the second generation was more than three times the number of German-born, while the number of second-generation Italians was less than twice the number of the first generation. Other comparisons of this kind can be made by referring to the detailed figures in the table.

Since less than 1% of the Negroes are foreign-born, and since the other racial groups constitute a very small fraction of the total population of the United States, the foreign white stock may be considered to represent practically the whole foreign element in the population of the United States

In the matter of geographic distribution, it may be noted that both the foreign-born and the children of the foreign-born are found mainly in the northern and western states, there being relatively few in any of the states south of Maryland except in Florida and Texas.

The highest percentages of foreign-born white were found in 1940 in New York, with 21 2%; Massachusetts, Rhode Island and Connecticut each with more than 19% and New Jersey with 16 7%.

In the early stages of large-scale immigration to the United States, a large proportion of the immigrants settled on the new farmland which was being opened up in the west, but after about 1890 when the supply of free land (or land nearly free) was practically exhausted, there was an increasing tendency for the foreign-born to settle in the industrial cities.

Thus, we find that while only 8 8% of the total population in 1940 was foreign-born, this class represented 12 5% of the urban population, 5 1% of the rural-nonfarm and only 3 1% of the rural farm.

With the disappearance of the frontier land, agitation for restriction of immigration began to appear. The newer immigrants created lasting problems of assimilation and housing and their competition with the native labourer was more keenly felt now that the latter had no frontier to which to escape. The problem became more acute after World War I, when the United States, faced with the problem of reabsorbing its own war veterans into normal industrial life, realized that some barrier should be erected to restrict immigration from Europe

Immigration increased from 141,132 in the year ending June 30, 1919, to 805,228 in 1921. Following somewhat lower figures in 1922 and 1923, immigration rose again in 1924 to 706,896. In this year the Immigration act of 1924 went into effect, with the result that in 1925 only 294,314 immigrant aliens were admitted to the United States. Admissions in the next few years were around 300,000, but further restrictions imposed as a result of the economic depression materially reduced the number admitted, so that the total for the decade ending in 1940 was only 528,431; and if from this figure be subtracted the number of emigrant aliens departing the net immigration for the decade would be only 68,693. Immigration remained at a low figure until 1946, in which year 108,721 immigrant aliens were admitted (net, 90,578); this figure increased gradually to 249,187 in 1950 (net, 221,589). Further information with regard to the general trend of immigration is given in the last column of Table I.

Sex Distribution.—The population of the United States in 1950, as shown in Table VI, comprised 74,633,000 males and 76,064,000 females, or 98.1 males per 100 females, as compared with 100.7 in 1940 and a maximum of 106.0 in 1910, which represented an excess of 2,692,288 males The excess of males had been reduced in 1940 to 453,909, and as the change in the sex ratio continued, the number of females passed the number of males around the middle of 1944, and by 1950 the excess of females, on the basis of the 1950 census count, amounted to 1,431,000.

In interpreting this figure, however, one should bear in mind the fact that in 1950 several hundred thousand males were in military service outside the United States and therefore not counted in the census.

Age.—The median age of the population of the United States —that is, the age which divides the population into two equal groups, one younger and the other older—showed an increase each decade from 1820, when it was 16 7 years, to 1950, when it was 30 1 years, the median ages for 1930 and 1940 being 26.5 years and 29 0 years respectively. The increase was chiefly the result of two causes: first, an increase in the average length of life; and second, a reduction in the birth rate which resulted in a decrease in the proportion of young persons in the population Immigration also tended to raise the median age since most immigrants were above 20 years of age The median age of the foreign-born white population in 1940 was 51.0 years, as compared with 26 9 years for the native white and 25.3 for the Negro population.

The age distribution of the population is shown for 1950 and 1940 in Table VIII

TABLE VIII.—*Population of the United States by Age*
(Figures for 1950 are based on the tabulation of a small sample)

Age	1950	1940	Per cent of increase	Per cent distribution	
				1950	1940
All ages	150,697,000	131,669,275	14 5	100 0	100 0
Less than 5 years	16,334,000	10,541,591	54 9	10 8	8 0
5 to 9 years	13,241,000	10,884,522	23 9	8 8	8 1
10 to 14 years	11,361,000	11,715,035	−3 3	7 5	8 9
15 to 19 years	10,739,000	11,311,523	−5 0	7 1	9 4
20 to 24 years	11,317,000	11,187,811	1 2	7 5	8 8
25 to 29 years	12,503,000	11,006,638	9 0	8 0	8 4
30 to 34 years	11,601,000	10,249,388	13 3	7 7	7 8
35 to 39 years	11,103,000	9,543,377	17 3	7 4	7 2
40 to 44 years	10,028,000	8,787,843	14 5	6 7	6 7
45 to 49 years	8,990,000	8,255,225	8 9	6 0	6 3
50 to 54 years	8,274,000	7,256,840	14 0	5 5	5 5
55 to 59 years	7,320,000	5,841,865	25 7	4 8	4 4
60 to 64 years	5,950,000	4,728,340	25 8	3 9	3 6
65 to 69 years	5,000,000	3,806,657	31 3	3 4	2 9
70 to 74 years	3,456,000	2,650,532	30 3	2 3	2 0
75 years and over	3,837,000	2,643,125	45 2	2 5	2 0
Median age, years	30 1	29 0	—	—	—

The most striking feature indicated by the figures in Table VIII is the great increase in the population under 5 years of age—an obvious result of the greatly increased numbers of births between 1945 and 1950, to which reference has already been made Against an increase of 14 5% in the total population, the population under 5 years of age increased by 54 9%, while the numbers of persons in the three 5-year groups representing persons from 10 to 24 years of age (those born during the extremely low birth-rate years) were actually smaller in 1950 than in 1940. While the population under 5 years of age formed 10 8% of the total in 1950, as compared with 8 0% in 1940, the population 15 to 19 years of age represented only 7.1% of the total in 1950, as compared with 9.4% in 1940.

At the other end of the age scale, persons 65 years old and over continued to show more rapid increase than those in any other age group except the youngest, and to increase their percentage of the total population, persons 65 years old and over representing 8.2% of the total in 1950, as compared with 6 9% in 1940.

Education.—Up to 1930 the census figures which offered the best index of educational attainment were based on a question with respect to literacy, though the figures shown in the census tables were usually the number or percentages of illiterates, that is, persons not able to read and write. The percentage of illiteracy in the total population decreased rather rapidly from 20 0 in 1870 to 6.0 in 1920 and 4.3 in 1930. On the latter date the percentage illiterate in the native white population was only 1.5, and when classified by age, it appeared that practically all of these illiterates were in the older age groups.

Partly because there seemed to be little room for further improvement in literacy in the major classes of the population, and partly to provide a classification more definite and tangible than the question on ability to read and write, a question on the number of years of schooling was substituted in 1940 for the traditional question on literacy. The results of this new inquiry, with respect to persons 25 years old and over, are presented in Table IX This age group was selected as comprising, for the most part, persons whose formal education had been completed, since many

of the persons under 25 years of age would be still in school and thus still in process of adding to their educational attainment.

Of the total population 25 years old and over in 1940, 4·6% had completed college, 14·1% had completed high school only, and 34·6% had completed grade school only, while 13·5% had completed less than 5 years of formal school attendance

The median number of years of school completed for the total population was 8·4. For the native white population alone, the median was 8·8, as compared with 7·3 for the foreign-born white, and 5·7 for the Negro population. A word of caution should be given with regard to the relation between these medians, which are expressed in tenths, and the basic classifications which are expressed in full years The median point for the total population is located at about the middle of the 8-year group, representing theoretically persons who have had 8·4 years in school, while the entire 8-year group includes also those who have had from 8·5 to 8·9 years (but less than 9 years). Note that these medians are purely theoretical index numbers, like the median size of family, for example, since the returns for school years completed are in full years and not in months or fractions. (L. E. T.)

TABLE IX.—*Persons 25 Years Old and Over by Years of School Completed: 1940*

Years of school completed	Total number	Per cent distribution				
		Total	Native white	Foreign-born white	Negro	Other races
Persons 25 years old or over	74,775,836	100·0	100·0	100·0	100·0	100·0
No school years completed	2,709,923	3·7	1·3	12·2	10·0	18·8
Grade school 1 to 4 years	7,204,689	9·7	6·1	16·1	21·3	17·1
5 and 6 years	6,525,111	11·4	9·7	14·3	21·5	14·0
7 and 8 years	25,897,052	34·6	36·0	36·4	29·8	22·6
High school 1 to 3 years	11,181,096	15·0	17·3	6·9	8·5	10·1
4 years	10,551,680	14·1	16·6	7·4	4·1	9·8
College 1 to 3 years	4,075,184	5·4	6·6	2·9	1·8	2·9
4 years or more	2,407,331	3·6	5·4	2·3	1·2	2·4
Not reported	1,041,970	1·4	1·5	1·5	1·8	2·4
Median school years completed	8·4	8·4	8·8	7·3	5·7	6·8
Per cent less than 5 years completed	13·5	13·5	7·6	28·3	41·3	15·9

Religious Bodies.—While the following statistics of membership may be used in a very general way for comparison of denominational strength, it must be remembered that membership is counted very differently in different denominations, the membership of children especially differing between Roman Catholic and most Protestant bodies. The Church of Christ, Scientist, is not included because the manual of that body forbids the numbering of the people and the reporting of such statistics for publication

According to the census of religious bodies taken by the United States bureau of the census in the year 1936 there were in the United States 256 religious denominations, represented by 199,302 organizations with 55,807,366 members.

By 1950, total church membership was estimated at 81,862,328 persons, according to the *Christian Herald*. Membership had been increasing for many years and this was the highest proportion of the total population ever reported—more than one out of two. Of this total, 50 larger denominations of more than 200,000 members each represented 97.2% of all church membership in the continental United States The remaining members, less than 3%, were in more than 200 bodies. Of the total church membership, 57·3% was Protestant, 32·6% Roman Catholic, 6.1% Jewish and 1.2% Greek Orthodox, Russian Orthodox, Armenian Orthodox and Polish National Catholic. Though Protestants as a group outnumbered Roman Catholics almost two to one, the Roman Catholic Church was far ahead of any other single denomination.

According to the 1936 federal census, the Roman Catholic was the leading denomination in membership in every one of the northern and western states, except in Idaho and Utah, where the Latter-Day Saints (Mormons) predominated by a large margin. In the southern states the leading denominations were either Baptist or Methodist. The Lutherans were relatively strongest in the north-central division of the country, their members consisting chiefly of Germans and Scandinavians. The other important Protestant bodies were widely and fairly evenly distributed over the country. Jewish congregations were most important in New York, Pennsylvania, Illinois, Massachusetts and New Jersey.

The immigration from southeastern Europe gave great strength to some sects which had no existence in the religious census of 1890, notably those of the Eastern Orthodox Churches (Russian, Serbian, Syrian and Greek). (X)

Employment Status.—One of the most important characteristics of any population is its relation to employment, with the various possible classifications by occupation, industry, etc. Of the total population of the United States 14 years old and over in 1950, which amounted to 111,915,000, 58,735,000, or 52·5%, were in the civilian labour force. Of this number, 55,843,000, or 95·1%, were employed, and 2,892,000, or 4·9%, were unemployed The percentage of males 14 years old and over in the civilian labour force was 77·3 (supplemented by an additional 1·5% in military service), while the corresponding percentage for females was 28·6, the major part of the women not in the labour force being engaged in caring for their own homes These figures are summarized, with percentages for the four main geographic regions into which the country is divided, in Table X

TABLE X.—*Employment Status of the Population 14 Years Old and Over, By Regions, By Sex: 1950*

(For composition of regions, see Table III Figures for 1950 are based on the tabulation of a small sample)

Sex and employment status	Total number	Per cent distribution				
		U S total	North east	North central	South	West
Total, 14 and over	111,915,000	100·0	100·0	100·0	100·0	100·0
Total labour force	59,597,000	53·2	53·6	51·7	52·3	51·6
Civilian labour force	58,735,000	52·5	52·8	51·4	51·4	52·2
Employed	55,843,000	49·9	49·6	51·4	49·3	48·4
Unemployed	2,892,000	2·6	3·2	1·1	2·0	3·8
Not in labour force	52,318,000	46·8	46·4	48·3	47·7	48·4
Male, 14 and over	54,078,000	100·0	100·0	100·0	100·0	100·0
Total labour force	43,268,000	79·8	78·1	80·3	78·1	77·7
Civilian labour force	42,446,000	77·3	76·5	79·8	76·4	75·0
Employed	40,317,000	73·1	71·7	77·7	73·6	69·6
Unemployed	2,130,000	3·9	5·1	2·1	2·9	5·4
Not in labour force	11,655,000	21·2	21·9	19·7	21·7	22·3
Female, 14 and over	57,997,000	100·0	100·0	100·0	100·0	100·0
Total labour force	16,329,000	28·6	30·1	28·0	27·2	29·6
Civilian labour force	16,289,000	28·6	30·2	27·9	27·1	29·5
Employed	15,526,000	27·3	29·1	26·9	25·8	27·4
Unemployed	763,000	1·3	1·1	1·0	1·3	2·1
Not in labour force	40,668,000	71·4	69·4	72·0	72·8	70·4

Since there is a definite relation between age and labour force participation, there is presented in Table XI a brief summary for the population, male and female, classified by age.

TABLE XI.—*Employment Status of the Population 14 Years Old and Over, By Age and Sex: 1950*

(Figures for 1950 are based on the tabulation of a small sample)

Age	Population 14 years old and over		Per cent in civilian labour force		Per cent of labour force employed	
	Male	Female	Male	Female	Male	Female
Total	54,078,000	57,663,000	83·2	16·4	98·4	97·4
14–19 yrs	7,431,000	7,243,000	49·4	15·0	98·0	92·4
20–24 yrs	7,167,000	6,904,000	91·0	33·3	95·7	95·5
25–34 yrs	11,379,000	11,374,000	97·6	28·5	98·2	98·0
35–44 yrs	11,533,000	11,434,000	96·3	21·4	99·0	99·3
45–54 yrs	8,329,000	8,233,000	94·6	17·4	99·1	97·7
55–64 yrs	6,127,000	6,129,000	88·6	11·5	97·9	99·0
65 yrs and over	2,985,000	2,772,000	63·6	5·2	100·1	97·7

It may be noted that from ages 25 to 54 years nearly the whole male population was in the civilian labour force—with considerable additional numbers, especially of those just above 20 years of age, in military service. In the female population the maximum labour force participation was in the age groups 20 to 24 years and 35 to 44 years, the intervening group containing many married women with young children

Another factor affecting labour force participation, especially for women, is marital status. A brief summary of the available data, classified in accordance with this factor, is presented in Table XII.

In accordance with these figures, 9,273,000 married women

TABLE XII.—*Labour Force Status of the Civilian Population 14 Years Old and Over, By Sex and Marital Status: 1950*
(Figures are based on a small sample survey)

Sex and marital status	Civilian population 14 and over	In labour force		Employed	
		Number	Per cent of pop.	Number	Per cent of labour force
Male	54,187,000	44,426,000	82 0	41,424,000	93 2
Single	14,213,000	8,808,000	62 0	7,710,000	88 0
Married, wife present	35,025,000	34,913,000	99 6	31,499,000	95 4
Married, wife absent	1,096,000	817,000	74 5	2,305,000	88 1
Widowed or divorced	3,853,000	1,790,000	46 0		
Female	56,613,000	17,705,000	31 4	16,674,000	93 7
Single	12,116,000	5,621,000	50 5	5,272,000	93 8
Married, husband present	35,023,000	8,550,000	23 8	8,038,000	94 0
Married, husband absent	1,536,000	703,000	45 4	3,364,000	92 8
Widowed or divorced	8,018,000	2,901,000	36 0		

were in the labour force in 1950, as compared with 5,621,000 single women. This represents a material change in the extent of employment of married women, even as compared with 1940, when the number of married women in the labour force was only 4,560,835, as compared with 6,349,474 single women Between 1940 and 1950, to be sure, the percentage of all women who were married had increased materially, but the increase in labour force participation on the part of married women was far greater.

Another fundamentally important classification of the labour force is that based on the industry in which employed. A brief summary of this distribution for employed workers in 1950 is presented in Table XIII, with percentages for the four regions as well as for the United States.

The largest single group in the series presented in this table is that designated "manufacturing," which gave employment to 25.3% of the whole number of employed workers in the United States as a whole, and an even larger percentage in the northeast and north central regions; the widest variation among the regions in the matter of industrial classification was that with respect to agriculture. In the country as a whole, 12.8% of the workers were in agriculture. In the northeast, however, only 3 8% were in this industry, as compared with 20.6% in the south and 14.5% in the north central region. All of these figures represent a marked decline (in the relative importance of agriculture, as measured by employment) from 1940, when corresponding percentages were as follows: 18.7 for the United States, 4.7 for the northeast, 19 5 for the north central region, 38 2 for the south and 15 9 for the west. Thus decline was largely the result of increased use of farm machinery and improvement in production methods.

Family Income.—A new inquiry on the 1950 census schedule was one relating to income—total income, as compared with wage or salary income alone, which was collected in 1940 A summary of the tabulation of family income, that is, of families classified by income, is presented in Table XIV.

A family, it may be noted, is defined for this purpose as a group of two or more related persons living in the same household or otherwise sharing the same accommodations. These figures, like those in the preceding table, are shown for the four regions, among which there are many significant differences. The median income of the 36,441,000 families for which data were obtained was $3,068. The regional medians ranged from $3,435 in the west and $3,362 in the northeast to $2,248 in the south The largest single group for the United States as a whole was the 3,989,000 families with income of $3,000 to $3,499, which formed 10 9% of the whole number of families. This same group included the largest number of families in all of the regions except the south, where the numbers of families in each of the four groups with incomes of less than $2,000 exceeded the numbers of families in any other income group.

Size of Household.—In 1850 there were 5.6 persons in the average U S. family or household. In 1890 the average population per family was 4 9; in 1900, 4 7; in 1910, 4.5, in 1920, 4 3; and in 1940, 3.8; these figures were obtained, in all cases, by dividing the total population by the number of families or households. In 1950 the average population per household or occupied dwelling unit was 3.5. The unusually large numbers of marriages in the decade ending in 1950 had obviously tended to increase the number of households, while the large numbers of births, being for the most part first or second births, had not accumulated to an extent sufficient to affect the average size of family or household.

Tenure of Home.—The whole number of occupied dwelling units or homes in the United States in 1950 was 42,520,000, this being the same as the number of households. Of these homes, 23,383,000, or 55 0%, were occupied by owners, while 19,136,000, or 45 0%, were occupied by tenants or renters Of the whole number of homes, 61.4% were single-family detached houses. In the rural-farm area, 95 1% of the homes were of this type; in the rural-nonfarm area, 81.9%; and in the urban area, 48 2%. Conversely, 10 0% of the urban homes were in structures containing 10 dwelling units or more, as compared with 0 5% in the rural-nonfarm areas, and practically none at all on the farms For the country as a whole, 6.7% of the homes were in these multifamily structures.

TABLE XIV.—*Families in the United States By Income, By Regions: 1949*
(Figures for 1950 are based on the tabulation of a small sample)

Income level	Total number	Per cent distribution				
		U S total	North-east	North central	South	West
Families reporting	36,441,000	100 0	100 0	100 0	100 0	100 0
Less than $500	3,129,000	8 6	7 0	7 0	12 4	6 3
$500-$999	2,630,000	7 2	5 6	5 4	12 0	4 5
$1,000-$1,499	2,664,000	7 3	4 9	6 3	10 8	5 7
$1,500-$1,999	2,777,000	7 5	5 8	6 5	10 0	6 2
$2,000-$2,499	3,378,000	9 3	9 0	9 0	9 9	8 5
$2,500-$2,999	3,707,000	10 2	9 6	8 0	8 1	11 2
$3,000-$3,499	3,989,000	10 9	12 9	11 5	8 0	11 6
$3,500-$3,999	3,179,000	8 7	9 4	10 0	6 1	10 6
$4,000-$4,499	2,620,000	7 2	8 5	7 8	4 0	8 6
$4,500-$4,999	1,786,000	4 9	5 2	5 5	3 7	5 8
$5,000-$5,999	2,864,000	7 9	9 0	8 8	5 3	9 4
$6,000-$6,999	1,557,000	4 3	5 0	4 6	3 0	5 3
$7,000-$9,999	1,714,000	4 7	5 6	5 0	3 3	5 5
More than $10,000	1,954,000	5 0	5 8	5 8	3 0	5 4
Median income	$3,068	$3,068	$3,362	$3,257	$2,248	$3,435

Of the owner-occupied homes, taken alone, 81.4% were single-family houses, as compared with 37.1% of the renter-occupied homes. These figures are presented in detail for urban and rural areas in Table XV.

Homes by Number of Rooms.—The median number of rooms in the occupied dwelling units in 1950 was 4.7, being 5.3 in the owner-occupied units and 3 8 in the renter-occupied units. These figures are summarized in Table XVI, from which it may be noted, in particular, that the 1-room, 2-room and 3-room

TABLE XIII.—*Employed Workers By Major Industry Groups, By Regions: 1950*
(Figures for 1950 are based on the tabulation of a small sample)

Industry group	Total number	Per cent distribution				
		U.S. total	North-east	North central	South	West
Total	55,843,000	100 0	100 0	100 0	100.0	100 0
Agriculture	7,138,000	12 8	3.8	14 5	20 6	9.6
Mining	971,000	1 7	1.4	3.0	2 8	1 8
Construction	3,480,000	6 2	5.8	5 3	6 8	8 1
Manufacturing	14,110,000	25.3	33 2	28 2	18.4	17.2
Durable goods	7,561,000	13.5	15.5	18 2	7 1	10 1
Nondurable goods	6,566,000	11.8	17 2	9 5	11.1	6.9
Not specified manufacturing	183,000	0 3	0 5	0.4	0 2	0.2
Transportation, communication, and other public utilities	4,259,000	7.6	7.8	7 9	6 8	8 7

All other industries	2,603,000	4 7	4.4	3 7	5 2	6.3
Industry not reported	850,000	1 5	1.3	1 7	1.5	1.8

dwelling units represented a much larger fraction of the whole number of tenant homes than of owned homes This is explained in part by the fact that dwelling units in apartment houses, which are practically all rented, are likely to be smaller, that is, to have fewer rooms, than the single-family detached houses.

Toilet Facilities.—An important current index of the quality of housing is the presence or absence of bathing and toilet facilities. Of the urban homes reporting in 1930, 86.9% had a flush toilet inside the structure for the exclusive use of the household; in the rural-nonfarm area, 55.6% of the homes were thus equipped, as compared with only 28.8% of the rural-farm homes Of the owner-occupied urban homes, 91.8% were provided with flush toilets, as compared with 82.0% of the renter-occupied homes and amount of rent paid, tend to support the assumption that the standard of living of the American people is relatively high The low and decreasing percentage of the working population engaged in agriculture, and the increasing percentages engaged in manufacturing, distribution and service activities (all evidences of further industrialization) indicate some of the reasons for the improving standards. And the increases in the rate of population growth doubtless represented in part the indirect result of this improved economic status.

TABLE XV.—*Occupied Dwelling Units By Tenure and Type of Structure· 1930*
(Figures for 1930 are based on the tabulation of a small sample)

Tenure and type of structure	Total number	Per cent distribution			
		U S total	Urban area	Rural nonfarm	Rural farm

TABLE XVI.—*Occupied Dwelling Units By Tenure and Number of Rooms· 1930*
(Figures for 1930 are based on the tabulation of a small sample)

Number of rooms	All occupied dwelling units		Owner-occupied dwelling units		Renter-occupied dwelling units	
	Number	Per cent	Number	Per cent	Number	Per cent
Total	42,520,000	—	23,383,000	—	19,136,000	—
Number reporting	41,863,000	100 0	23,033,000	100 0	18,830,000	100 0
1 room	1,021,000	2 4	21,000	0 0	807,000	4 3
2 rooms	2,958,000	7 1	578,000	2 5	2,378,000	12 6
3 rooms	6,025,000	14 4	1,421,000	6 2	4,604,000	24 5
4 rooms	9,176,000	21 9	4,133,000	18 0	4,853,000	25 8
5 rooms	9,233,000	21 8	5,877,000	25 5	3,356,000	17 3
6 rooms	7,290,000	17 4	5,530,000	24 0	1,760,000	9 3
7 rooms	3,055,000	7 2	2,437,000	10 6	599,000	3 2
8 rooms	1,795,000	4 3	1,485,000	6 4	310,000	1 6
9 rooms or more	1,433,000	3 4	1,169,000	5 1	264,000	1 4
Median number of rooms	4 7	—	5 3	—	3 8	—

Similar differences appeared in the other areas for which data are available These figures are presented, with additional details, in Table XVII.

Value or Rent.—Occupied homes in urban and rural-nonfarm areas combined (omitting farm homes, since it is difficult to obtain a separate value for the home on a farm), are classified in Table XVIII by value or rent The median value of the owner-occupied homes was $7,400 More than half of the whole number of homes were in three groups ranging in value from $6,000 to $14,999, while only 7.7% represented homes valued at less than $2,000. The median monthly rental of the tenant-occupied homes was $35. Considerably more than half the whole number of these homes carried rentals ranging from $30 to $49, and for only 4.4% was the rental less than $10.

Many of the items briefly presented above, including, for example, the figures on income, plumbing equipment in the homes and amount of rent paid, tend to support the assumption that the standard of living of the American people is relatively high The low and decreasing percentage of the working population engaged in agriculture, and the increasing percentages engaged in manufacturing, distribution and service activities (all evidences of further industrialization) indicate some of the reasons for the improving standards. And the increases in the rate of population growth doubtless represented in part the indirect result of this improved economic status.

VI. NATIONAL FINANCES

Establishment of the Financial System.—Under the Articles of Confederation, the federal government had been empowered to borrow and make requisitions on the states, but not to tax Thus, it was largely dependent upon the states, which levied all taxes. In the first two years of the confederation, congress asked for $10,600,000; the states responded with less than $1,600,000 During the entire period of the confederation, 1781–89, the federal government received barely enough to meet current expenses, and not enough to meet interest requirements on the continuously rising debt. The national finances finally broke down completely in 1786 Further borrowing had become virtually impossible and requisitions yielded practically nothing This collapse, caused by the financial impotence of the government, was the immediate reason for the call in 1787 for a constitutional convention.

The new constitution, which came into effect in 1789, gave the federal government power to lay and collect taxes, duties and excises; to borrow money, pay debts, and coin money and regulate its value The states, on the other hand, were deprived of the right to coin money, emit bills of credit, make anything but gold and silver legal tender in payment of debts or to lay any duties on imports or exports Federal expenditures were restricted to appropriations made by congress. These new financial powers of the federal government were implemented by the grant to congress of powers to provide for calling out the militia to execute the laws of the union, and by the provisions making the judicial power of the federal government coextensive with its legislative power

The creation of the treasury department, with a single head in preference to a proposed commission, and the appointment of Alexander Hamilton (*q v.*) as secretary of the treasury, settled the next important financial question. Attention was then directed to making provision for the public debt. In addition to gifts of nearly $2,000,000 from the French and Spanish treasuries, the United States had borrowed about $11,800,000 (including arrears of interest) in France, Holland and Spain In addition, the domestic debt of the federal government, consisting of a great variety of obligations, was estimated by Hamilton in 1790 at $42,400,000, exclusive of the continental currency Finally, the individual states, in the prosecution of the war, had contracted debts of various descriptions, aggregating approximately $18,300,000 Under the Funding act of Aug. 4, 1790, all of the foregoing indebtedness was converted into new federal loans. Despite the great previous depreciation in value of nearly all the obligations, they were all paid off at par and accrued interest in new bonds, with the single exception of the continental bills of credit About $6,000,000 of this continental currency, of which about $78,000,000 was estimated to be outstanding, was funded into the new debt at the rate of 100 to 1, the remainder was not presented This exceptional treatment was justified on the ground that the continental bills had long since ceased to circulate as currency, and as far back as 1781 had been bought and sold by speculators at rates ranging from 500 to 1,000 to 1.

The final step necessary for a stable financial system was the establishment of a uniform currency system. The Mint act of April 2, 1792, provided for a bimetallic monetary system, based upon a dollar consisting of $24\frac{3}{4}$ grains of pure gold or $371\frac{1}{4}$ grains of pure silver, a ratio of 1 to 15. The act provided for the unlimited and gratuitous coinage by the mint, to be established in Philadelphia, Pa., of both metals, at the option of any holder.

NATIONAL FINANCES 1792–1913

Until the Civil War, customs duties constituted the main source of revenue of the federal government The few internal revenue taxes that had been intermittently in force were largely abolished in 1817 Sales of public lands yielded varying amounts annually, ranging, after 1800, from $168,000 in 1801 to $25,000,000 in 1836 The national debt was extinguished in 1835—though the depression following the panic of 1837 and the Mexican War quickly created a new debt The Civil War, disrupting the economic as well as the political life of the nation, and waged relentlessly for four long years, created serious fiscal problems. The treasury was forced to suspend specie redemption of its legal tender notes (greenbacks), which, issued in the amount of $449,000,000 during the war, depreciated severely in terms of gold, this depreciation amounting to as much as 61% at one time Despite the introduction of a series of highly productive internal revenue taxes, heavy annual deficits were incurred The interest-bearing public debt rose from approximately $65,000,000 in 1860 to $2,322,000,000 in 1866. On June 30, 1860, the government's gross debt was only $2.06 per capita, by June 30, 1866, it had risen to $77 69 per capita—a figure not reached again until World War I. The National Banking act of 1863, which authorized the establishment of national banks and the issue by such banks of circulating notes secured by United States bonds, helped to provide a market for the Civil War bond issues Financial recovery was swift in the years following the Civil War The wartime excise taxes were largely retained, and the combination of these and the still growing customs receipts resulted in a long series of uninterrupted budget surpluses (1866–93) The treasury resumed specie payments in 1879, and the interest-bearing public debt was continuously reduced, falling below $1,000,000,000 by 1888.

The resumption of specie payments soon brought monetary controversies to the fore The original gold-silver mint ratio of 15 to 1 set in 1792 had closely approximated the actual market ratio Very soon thereafter, however, a decline in the market value of silver tended to send gold coins out of circulation and out of the country. After several years of discussion, congress in 1834 reduced the content of the gold dollar and in 1837 raised it slightly, without changing the weight of the silver dollar The resulting ratios, 16 002 and 15 988 to 1, both overvalued gold rather decidedly Silver dollars were melted and sold as bullion. Following discoveries of gold in California and Australia in 1848 and 1849, the value of silver rose so much in terms of gold that congress in 1853 had to reduce the bullion content of fractional silver coins to prevent their being melted and sold as bullion. In revising the list of coins to be struck by the mint, preparatory to the resumption of specie payments, congress in 1873 eliminated the silver dollar. This attracted little notice at the time because no silver dollars had been coined for many years. Soon afterward, the discovery of new silver supplies in the United States and the demonetization of silver by several European countries caused a decline in the market price of silver A strong movement arose in the United States for the resumption of unlimited coinage of silver dollars. Many supporters of this movement hoped thereby to check the current decline in general commodity prices Partial concessions to this movement were made by congress in 1878 and in 1890 when the Bland-Allison and the Sherman Silver Purchase acts, respectively, were passed. Under the former, the secretary of the treasury was directed to purchase $2,000,000 to $4,000,000 of silver bullion at market prices each month, and to issue therefor legal tender silver dollar coins, or silver certificates representing the deposit of such coins in the treasury. This act was succeeded by the Sherman act, whereunder the secretary of the treasury was directed to purchase 4,500,000 oz. of silver bullion per month and to pay therefor in legal tender treasury notes redeemable in either gold or silver, at his option. Neither of these acts provided for the unlimited coinage of silver and, therefore, left the monetary system on an essentially monometallic gold base The Sherman act was repealed in 1893, after the treasury's gold reserve had been greatly reduced by the repeated redemption of the Sherman notes in gold. The outstanding public question during the presidential campaign preceding the election of 1896 was

whether the United States should re-establish a bimetallic monetary system on the basis of both gold and silver, or maintain a single gold standard. Following Pres William McKinley's election, the silver movement lost much of its impetus, mainly because the increasing output of the South African gold mines and the expanding volume of credit provided by the banking system made possible a period of rising prices In the Gold Standard act of 1900, the monetary standard of the United States was formally declared to consist of 25 8 grains of gold nine-tenths fine; and the secretary of the treasury was directed to maintain all forms of money of the United States at par.

NATIONAL FINANCES 1913–30

Taxation.—A notable development in the federal revenue structure after 1913 was the adoption and entrenchment of direct taxes, levied at progressive rates, as the basic source of public revenues The 16th amendment, authorizing the federal government to "lay and collect taxes on incomes from whatever source derived" was ratified in 1913, and was utilized almost immediately in the Tariff act of Oct. 3 of that year. The entrance of the United States into World War I quickly caused income taxation, supplemented for a time by excess-profits taxes, to take preeminent rank in the revenue system In 1910, more than 96% of the total internal revenue and customs receipts of the federal government was derived from customs duties and excise taxes on tobacco and alcoholic beverages; in 1920, 69%, and in 1930, 66 5%, was derived from income and profits taxes. The principles of direct and progressive taxation were also applied to estates, beginning with the Revenue act of 1916.

World War I transformed the importance of federal revenues and expenditures in the economic life of the country. Prior to 1917, the total ordinary expenditures of the federal government had exceeded $1,000,000,000 only once During the next six years, in contrast, total ordinary expenditures aggregated more than $48,000,000,000. Similarly, prior to 1917, total ordinary receipts had never reached $1,000,000,000; but during the next six years they aggregated more than $26,000,000,000. Under the Revenue act of 1918, the rates of tax on individual incomes of the year 1918 started at 6%, after an exemption of $1,000 for a single person, $2,000 for a married person and $200 for each dependent, and rose to 77% (65% surtax) on net incomes of more than $1,000,000. The taxes on corporations included one-tenth of 1% on their capital stock in excess of $5,000, 12% on their net incomes, and combined war profits and excess-profits taxes ranging up to 80% of profits in excess of certain credits, for the taxable year 1918. Many new taxes were imposed on commodities and business transactions.

Public Debt.—The enormous increase in taxation in 1917–20, while unprecedented in the previous history of the country, did not provide revenues sufficient to pay even one-half of the immediate financial cost of World War I, inclusive of loans to foreign governments The deficit financing made necessary by the prodigious financial costs of the war was conducted with remarkable facility The federal reserve system, which had been placed in operation in Nov 1914, played a valuable role in this connection Bank loans secured by the government obligations were made eligible for rediscount by the federal reserve banks; and this fact enormously increased the disposition and ability of the U.S. public to purchase the government's obligations The treasury's principal practice was to obtain funds initially through the issue of short-term certificates of indebtedness, which were sold mainly to banks, and subsequently to fund these loans into large popular bond issues The five such War Loans issued during the war and post-Armistice periods raised an aggregate sum of approximately $21,000,000,000; and the number of separate subscriptions ranged from approximately 4,000,000 for the First Liberty Loan to nearly 22,800,000 for the Fourth Liberty Loan Immediately after the war, congress provided for the systematic discharge of the public debt, which attained a peak of $26,594,267,878 on Aug. 31, 1919. The debt was reduced about $10,000,000,000 over the next ten years.

A series of drastic tax reductions also followed After Pres. Warren G. Harding's inauguration, the excess-profits tax on corporations was repealed (this was partially offset by an increase in the corporation income tax), the rates on individual incomes were reduced and a number of excise taxes eliminated (Revenue act of 1921) In 1924, further reductions in individual income tax rates and excise duties were made In 1926 sharp reductions were made in the income tax rates applicable to large individual incomes. The maximum surtax on individual incomes, which had previously been successively reduced from 65% to 50% and to 40%, was now fixed at only 20%.

The Budget.—An important fiscal development of this period was the inauguration of an executive budget, under an act of congress of June 10, 1921. A bureau of the budget was established to prepare the annual budget and such supplemental and deficiency estimates as the president might desire to recommend to congress At first, the budget was largely an accounting document designed to secure economy in government Under the stress of depression and war, however, the budget became the main instrument for the presentation of the president's views on the requirements of fiscal policy for the economic well-being of the nation.

Loans to Foreign Governments.—During and after World War I, the United States made loans aggregating more than $10,000,000,000 to foreign governments. More than $7,000,000,000 of these loans were made to allied governments before the Armistice to assist them in purchasing war supplies in the United States. After the Armistice, about $2,500,000,000 of loans were made, and, in addition, about $740,000,000 of excess war supplies, foodstuffs and other relief supplies required for needy populations were sold on credit Funding agreements were reached with 15 of the 20 debtor countries providing for repayment over a period of 62 years. In Dec 1931 congress authorized a moratorium on these debts during the fiscal year 1932 At the expiration of this moratorium, six countries resumed their payments in full and two made token payments; in 1933 Finland continued paying in full but the other seven made only token payments After Dec. 1933 all remittances ceased except those of Finland, which continued payments in full, and Greece and Hungary, which continued to make certain partial payments. It was gradually recognized that war loans must be considered part of the cost of war and not readily collectable.

NATIONAL FINANCES 1930–39

The world-wide depression that began in 1929 produced effects upon the national finances comparable to those of a major war. The efforts of Pres. Herbert Hoover's administration were largely centred on government loans to financially embarrassed railroads, banks, insurance companies and other business enterprises. By the time of Pres. Franklin D. Roosevelt's inauguration (March 4, 1933), however, the rapid spread of banking "holidays" that had been declared in a number of states during the preceding month threatened the imminent collapse of the whole financial machinery of the country President Roosevelt met this situation by an immediate nation-wide suspension of banking operations, followed very shortly by the reopening of all banks that appeared to merit public confidence. In order to achieve greater monetary flexibility, and among other things to stimulate a recovery in commodity prices and an expansion of credit at low interest rates, the operation of the gold standard in the form prevailing before 1933 was suspended, and later the gold content of the dollar was reduced. The pressing problems of farm debts and extremely low agricultural prices were attacked by a broad program of agricultural adjustment and an increase of credit facilities for farmers. The heavy burden of urban as well as farm debt was lightened through the establishment of new credit agencies and the stimulation of old ones. Meanwhile, recognizing the enormous expenditures required for unemployment relief, congress made a greatly increased volume of federal funds available for direct and work relief and as grants-in-aid to the states and their subdivisions for the construction of public works The establishment for the first time of a nation-wide relief system was followed in 1935 by the initiation of permanent measures to provide security against the hazards of unemployment and old age on a national scale.

†Less than $500,000

Taxation.—To finance as large a proportion of the increased costs of government through taxation as was compatible with economic recovery, numerous steps were taken to strengthen the tax system. At the same time tax measures were adopted in conjunction with the agricultural, old-age security and unemployment insurance programs.

In 1932 a gift tax, a large group of manufacturers' excise and other miscellaneous taxes were enacted. In 1933 the capital stock tax, the excess-profits tax and taxes on beer, and in 1934 the alcoholic beverage taxes were added. Rates of the estate and gift taxes were increased and exemptions were decreased.

Numerous changes were made in the income tax beginning in 1932 Personal exemptions were reduced Rates of both individual and corporation taxes were increased The corporation tax was converted from a flat percentage to a graduated tax. The earned income credit, the deduction of capital losses and the carry-over of losses were restricted or eliminated but later restored in whole or part Dividends were made subject to the personal normal tax even though they came from corporations that had paid corporation income taxes, and 15% of intercorporate dividends were made taxable Corporations filing consolidated returns were for a while subject to an additional tax, and later the privilege of filing such returns was limited to railroad and street and interurban railway corporations. With a view to rendering the individual income tax more effective, special taxes were imposed on personal holding companies, and the tax on corporations accumulating surplus to avoid surtax on shareholders was strengthened. In 1936 a tax was imposed on undistributed profits, reduced in 1938 and eliminated in 1939 The compensations of the officers and employees of the states and their political subdivisions became taxable under the individual income tax in 1939.

Under the Social Security act of 1935 taxes were imposed on both employers and employees for old-age insurance and unemployment compensation purposes

TABLE II.—*Amount of Interest-Bearing Public Debt Outstanding, the Computed Annual Interest Charge, and the Computed Rate of Interest*
(millions of dollars)

1945	256,356	4,963	1.94
1950	255,209	5,613	2.20

Public Debt.—The successful management of the public debt became a matter of more than ordinary importance after 1932. By reason of the enormous emergency expenditures, the total gross public debt, which amounted to about $16,000,000,000 at its post-World War I low on Dec. 31, 1930, had risen to approximately $40,000,000,000 on June 30, 1939. The problem of arranging the maturities, interest rates and other terms of this large volume of new obligations was complicated by the great desirability of refunding more than $8,000,000,000 of Liberty Loan bonds which became callable during the period. Most of the First Liberty Loan bonds, outstanding in the amount of $1,933,000,000, were exempt from all surtaxes and this made their conversion into ordinary obligations the more desirable. The Fourth Liberty Loan bonds, outstanding in the amount of $6,268,000,000, bore interest at the rate of 4½%, and would have had to be redeemed by 1938 in any event The treasury was able not only to carry through the refunding program and to raise large sums of new money without difficulty, but also substantially to reduce the average rate of interest on the government debt. The reduction in the computed rate of interest that accompanied the growth in the interest-bearing debt between 1930 and 1939 is shown in Table II

Monetary Developments.—Major changes in the country's monetary and banking system took place in the years 1933 to 1935. The disastrous deflation of the period immediately preceding, coupled with the mounting tendency on the part of the public to hoard gold as well as other forms of currency, finally made necessary the temporary suspension of banking operations throughout the country on March 6, 1933. On March 9, congress passed the Emergency Banking act, whereunder it was quickly possible to reopen a large majority of the nation's banks. Confidence in the banking system was restored by the prompt action of the administration; money in circulation, which had mounted to a peak of about $7,500,000,000 in March in reflection of the hoarding movement, declined to about $5,600,000,000 by the end of August A repetition of such banking difficulties was made unlikely by the establishment of the Federal Deposit Insurance corporation pursuant to the Banking act of 1933. The first $5,000 of the commercial or savings deposits of any customer of an insured bank was guaranteed; and all member banks of the federal reserve system, as well as most other banks in the country, became insured banks.

Meanwhile, congressional and executive actions were taken to free the price level from the deflationary forces still conspicuous in gold-standard countries, through instituting a measure of deliberate management and control over the foreign exchange value of the currency The government took possession of and title to all gold coins, gold bullion and gold certificates, and all silver bullion held in the United States except that required for commercial purposes Dollar obligations providing for payment in gold were declared payable in any legal tender coin or currency, and all the outstanding coins and currencies of the country were made legal tender. In line with congressional measures authorizing the president to fix the weight of the gold dollar at not more than 60% and not less than 50% of the previous statutory weight ($25\frac{8}{10}$ grains nine-tenths fine), President Roosevelt, on Jan 31, 1934, proclaimed the weight of the gold dollar to be $15\frac{5}{21}$ grains nine-tenths fine, a reduction of 40 94% The dollar value of the gold held by the treasury was thereby increased by $2,811,000,000 Of this amount, $2,000,000,000 was allocated to a stabilization fund, under the control of the secretary of the treasury, to deal in gold, foreign exchange and other credit instruments for the purpose of stabilizing the exchange value of the dollar. The Gold Reserve act of 1934 prohibited further gold coinage, made the acquisition of gold for export or other purposes subject to regulations prescribed by the secretary of the treasury; and substituted gold certificates for gold coin in the reserve requirements of the federal reserve banks.

Meanwhile, pursuant to the Silver Purchase act of June 19, 1934, declaring it to be the policy of the United States to increase the proportion of silver to gold in the country's monetary stock to one-fourth, the treasury made large purchases of silver bullion at home and abroad By June 30, 1939, 284,000,000 fine ounces of newly mined domestic silver, 1,706,906,000 of foreign silver and 113,000,000 of silver in the United States prior to Aug. 9, 1934, had been purchased The price to be paid for domestic silver newly mined after July 1, 1939, was later increased from 64 to 71 cents per ounce

NATIONAL FINANCES 1940–50

The outbreak of war in Europe in Aug. 1939 ushered in the most spectacular decade thus far in the national finances of the United States. Government expenditures and receipts were raised to levels never before contemplated, not only in absolute terms but in proportion to the national product and income. The national debt, likewise, reached a height that previously would have been thought equivalent to national bankruptcy. In the years after World War II it was evident that government fiscal operations would remain a much more dominating factor in the nation's economy than before the war, even though the wartime levels were drastically curtailed.

Although initial steps to strengthen the nation's defenses were taken immediately after the outbreak of war in 1939, it was only with the fall of France in 1940 that the real threat to the nation and to the entire democratic world from nazi aggression was recognized. A large rearmament program was announced by President Roosevelt and the size of the program was steadily increased throughout the rest of 1940 and 1941.

Vigorous steps were taken to secure the economic mobilization of the nation and lay the groundwork for an overwhelming superiority of arms. As the nazi attack on Great Britain intensified, the lend-lease program was instituted under which assistance was given first to Britain and later to the USSR. when that country was attacked by Germany. President Roosevelt declared that the intention of the nation was to become the "arsenal of democracy and the production goals were made consistent with that aim Soon the U S was not only supplying war matériel to Great Britain but actually convoying the shipments to protect them from axis submarines.

Thus, when the attack on Pearl Harbor by Japan came on Dec 7, 1941, the nation had already made considerable progress toward rearmament and economic mobilization for war President Roosevelt announced a month later, in presenting his first wartime budget message to congress, that the goals for military production would be 50,000 planes per year and 8,000,000 tons of shipping Thereafter, the rapidity of total mobilization for war and the consequent increase in government armament expenditures were spectacular. It may be seen in Table III that total expenditures rose from a little less than $9,000,000,000 in 1939 to almost $99,000,000,000 in 1945 All of this increase grew out of wartime requirements even though, in the breakdown in Table III, it is partly shown under other categories of expenditures Outlays for direct national defense, including lend-lease and the required expansion of industrial capacity, increased to $84,569,000,000 in 1945 whereas they had been only a little more than $1,000,000,000 in 1939 The other large increases were for veterans' benefits transportation and communication and interest on the public debt all of which were an outgrowth of the war The item of transportation and communication is largely accounted for by the wartime merchant marine requirements, while the increase in interest on the public debt reflects the fact that so large a proportion of the government's outlays had to be financed by borrowing On balance there was a significant decline in the nonwar expenditures of the government primarily because the end of the depression of the 1930s under the stimulus of a wartime boom made it possible to curtail social welfare expenditures from almost $4,000,000,000 in 1939 to a little more than $1,000,000,000 in 1945

As soon as World War II ended, a rapid curtailment of war production and demobilization was begun By 1947 government expenditures had been reduced to approximately $40,000,000,000 and by the end of the decade, prior to the outbreak of war in Korea, they were still at that level.

Although national defense expenditures were curtailed much more drastically, it may be seen from the pattern of budget expenditures in 1949 that other activities had assumed a much larger place in the budget. Services and benefits to veterans required an expenditure of $6,669,000,000 in 1949, and while part of this was for such temporary purposes as education and peacetime training, it was apparent that the cost of veterans' benefits would remain high for many years to come Another significant increase shown in the 1949 pattern was for international affairs

and finance, with an expenditure of $6,462,000,000. The major part of this amount was utilized for economic assistance to foreign countries under the Marshall plan and for other types of foreign aid.

Taxation.—In order to meet the fiscal requirements of total war an extensive system of tax increases was instituted from 1940 to 1944. The detailed changes are too numerous to mention but the results of the various tax actions may be seen in the increase in government revenues from $5,103,000,000 in 1939 to $44,762,000,000 in 1945. The large revenue producers were the individual income tax and the taxes imposed on corporation profits, consisting of high wartime rates of surtaxes and a special wartime excess-profits tax. In addition, substantial excise taxes were imposed upon a wide range of luxury goods. Direct taxes on individuals produced almost $20,000,000,000 of revenues in 1945, while the corporation income and excess-profits taxes yielded more than $16,000,000,000. A perspective on the increase in the individual income tax over the years can be seen in Tables IV and V, which show the tax liability and the rate of tax for a typical family of four persons. It will be noted that as late as 1940 such families with incomes of $3,000 were untaxed whereas during World War II even families with as little as $600 had some tax liability. At the upper end of the income scale, the effective tax rate became as high as 88.6% and even in the middle-income brackets the tax rate ranged from 15% to almost 40%.

Taxes began to be lowered soon after the end of World War II. The excess-profits tax on corporations was abolished, income tax rates were generally

reduced and the exemption limit was raised from $500 to $600 Further reductions were made in the Revenue act of 1948 when the split-income provision was instituted, allowing a man and wife to count their joint income as having been earned in equal parts by each partner for income tax purposes.

National Debt.—Although revenues were increased substantially during World War II, the level of the government expenditures was so high that a substantial portion had to be financed by borrowing. The result was a precipitous increase in interest-bearing from $42,376,000,000 in 1940 to $256,357,000,000 in 1945. A major part of the treasury's borrowing was accomplished through a series of war bond drives in which great emphasis was placed on the sale of bonds to individuals By 1945 the savings bonds outstanding, which was the main type of security used for this purpose, amounted to more than $45,000,000,000. Throughout its tremendous financing program, the treasury maintained a low interest policy and secured a substantial part of its financial requirements through notes and other short-term securities. In this regard, the World War II experience was much different from that of World War I Whereas the computed rate of interest on all outstanding debts rose to 4¼% by 1920, the interest rate during most of World War II was less than 2% This low rate of interest was partly accounted for by the very low yields of short-term securities.

In the immediate postwar period, the main trends in the government debt are shown in Tables VI and VIII These consist (1) of the shift of the debt from banks to nonbank investors; and (2) in the refinancing of short-term securities The latter shift was accomplished largely by the increase in the special issues to government agencies and trust funds.

As the decade closed the nation appeared once again to be entering a protracted period of rearmament. With the outbreak of war in Korea, government expenditures were increased Individual and corporation income taxes were raised, and a new excess-profits tax on corporate income was enacted. It appeared that further huge increases in the government budget were certain to come.

Government Corporations and Credit Agencies.—A significant development of the depression years and later of the World War II and postwar periods was the large growth of government corporations and credit agencies. Essentially these instruments were used for operations that were business in character such as lending, investing and buying and selling, but which could not be carried out by private business because of their risk or their special relation to the public interest.

In attacking the varied financial problems created by the depression, the federal government made large loans and investments, directly and through governmental corporations and credit agencies; and it guaranteed a large volume of obligations issued by governmental corporations. Through the establishment of the government-owned Home Owners' Loan corporation and Federal Farm Mortgage corporation, the government provided facilities for the emergency refinancing of mortgages on homes and farms These corporations, together with the federal land banks, the Federal Housing administration, the Federal Savings and Loan system and the Federal Savings and Loan Insurance corporation operated to stem the flood of foreclosures on farms and homes and to reduce rates of interest on mortgage loans. In addition, emergency aid was provided for railroads, banking, insurance, industrial and commercial corporations by the Reconstruction Finance corporation. Also, the corporation instrument was used for such purposes as the rural electrification program and the power and flood control program in the Tennessee valley

During World War II the Reconstruction Finance corporation was given broad authority to assure the required expansion of war production facilities and the output of scarce materials In the postwar period the Commodity Credit corporation engaged in large operations to stabilize the prices of farm products through

the credit facilities of the housing agency were utilized for housing purposes

From Table VIII, showing the assets and liabilities of government corporations and credit agencies as of June 30, 1950, it will be seen that the government interest in these agencies was $21,679,000,000 On June 30, 1939, the comparable figure was only a little more than $3,600,000,000, indicating the huge war and postwar growth of these operations. (M. Gt.)

VII. INDUSTRY AND COMMERCE

Introduction.—The industry and commerce of the United States from the early 19th century to the middle of the 20th century were characterized by successive waves of growth and development, retarded periodically by crises and depressions. Normally the dates of these waves are fixed by the troughs of the depression, but the more significant activities are represented by the crests of the waves During this time there were approximately 11 periods of marked prosperity, during which trade and commerce increased by leaps and bounds The panic years most frequently mentioned are 1825, 1837, 1847, 1857, 1873, 1893, 1907, 1913, 1920 and 1929. In reviewing this sequence it appears that trade and commerce moved in approximately ten-year cycles except for the more profound disturbances caused by the Civil War and World Wars I and II.

In addition to the ten-year cycles there seemed to be longer swings in U.S industrial expansion during which certain industries developed with great rapidity and appeared to dominate the industrial activity of the country. From 1840 to 1860, for example, railroads, agriculture and the textile and iron industries spread over great areas of the country with remarkable rapidity Starting with 23 mi of railroads in operation in 1830, there was a rapid annual increase, to 2,818 mi in 1840, 9,021 mi. in 1850 and 30,626 mi. in 1860. Agricultural products practically doubled in volume during the 27 years between 1839 (when census crop statistics first became available) and 1866 (when regular crop reports were begun in the department of agriculture). The corn harvested for grain in 1839, for example, was 377,532,000 bu., and in 1866 corn production for all purposes was 730,814,000 bu The wheat harvested for grain in 1839 was 84,823,000 bu and in 1866 was 169,703,000 bu Oats harvested for grain in 1839 totalled 123,071,000 bu and in 1866 totalled 232,360,000 bu.

The textile industry had an equally rapid development during that period. Cotton production, despite the war years of 1861–65, held its own. In 1839 it totalled 1,654,000 bales, and in 1866 it was 1,948,000 bales. During that 27-year period, however, its best year was 1859, with a yield of 4,508,000 bales In the factories cotton was being spun into thread and cloth to the busy hum of spindles. In 1840 there were about 2,284,631 spindles preparing for consumer use 236,525 bales of cotton. In 1860 the number of spindles had practically doubled to 5,235,727, and these were busy at a more than tripled bale count of 845,410.

Pig iron production had kept pace. In 1840 the total was 321,331 tons; by 1860 it had almost tripled with 919,770 tons; and by 1866 it was 1,350,343 tons

From the end of the Civil War in 1865 to the beginning of World War I in 1914 the growth in trade and commerce continued to show astonishing progress Agricultural production in-

525,477 in 1914 Pig iron production totalled 1,461,526 net tons in 1867; in 1914, 26,132,113 net tons

But manufactured products set an even faster pace of development than any of the above Steel production figures—available for the first time in 1867—showed for that year an output of 19,643 long tons, in 1914, an output of 23,513,030 long tons. The output of cotton manufactures jumped from 796,616 bales in 1870 to 5,884,733 bales in 1914. A grand total value of all finished commodities, excluding construction materials, gives the financial picture of this growth In 1869 the value totalled $2,723,582,000, by 1914, the value totalled $14,231,028,000 and had increased more than fivefold

The period from the beginning of World War I through World War II saw two depressions: (1) a postwar depression striking its low in 1921, when the index of industrial production declined to 58 (it had been 72 in 1919); and (2) a country-wide depression reaching its low in 1932 with an identical index of 58. (*See* Table I) From 1933, however, when the index was 69, to 1943, when the index was 239, each year except 1938 saw an increase over the preceding year. In 1944 with an index of 235 it began taper-

*Preliminary estimate
Source Figures for 1919 through 1938 from Simon Kuznets *et al*, *National Income and Its Composition, 1919–1938*, (National Bureau of Economic Research (1941). Figures for 1939 through 1949 from U S Department of Commerce, "Survey of Current Business" (July 1950)

ing off after the huge output of World War II, until in 1946 it had receded to a more normal 170. It then climbed to 187 in 1947, to 192 in 1948, receded to 176 in 1949 but reached 200 again in 1950

These industrial production index figures become more tangible when some of their elements are considered. To cite but one example, each census of manufactures taken from 1849 to 1947 (*see* Table V) furnishes figures for the value added by the manufacturers to the products which they processed. In 1914 this figure was $9,385,622,000 In 1919 it jumped to $23,841,-624,000. In 1921 it declined to $17,252,775,000, but by 1929 it reached a peak of $30,591,435,000. Ten years later in 1939, following a low of $14,007,540,000 in 1933, it had climbed to $24,487,304,000, and in 1947 had reached an all-time high of $74,425,825,000

The agricultural production index, begun in 1909 by the department of agriculture (*see* Table II) shows an interesting pattern with less fluctuation than does the industrial production index—a difference patently explainable by the very nature of agricultural and industrial production. From a 1914 figure of 86, the index reached 90 in 1918; and although it declined to 83 in 1921, it reached 100 by 1926. It stayed in the upper 90s or low 100s through 1933, dropped to 91 in 1935, began then to climb and by 1940 reached 110. The World War II years pushed it up and there it stayed in the postwar period. By 1949 it reached 140, declining to 137 in 1950

The gross farm income figures, which include (1) cash receipts from farm marketings and (2) value of home consumption, but which do not include income from any farm rentals, are shown in Table III for the years 1910 through 1950 The figure for 1914 was $7,212,000,000. It climbed steadily until 1919, when it reached a peak of $16,998,000,000, then fell to $9,717,000,000 in 1921, climbed slowly to $13,002,000,000 in 1929, fell off sharply to $5,756,000,000 by 1932, began to climb back through the next decade, but not till 1942, even with government payments which began in 1933, did the figure of $17,160,000,000 surpass the earlier peak of 1919. From then on it climbed steadily to a peak of $33,480,000,000 in 1948, receded to $30,631,000,000 in 1949 and again receded slightly to $30,100,000,000 in 1950.

National Income.—The department of commerce began to publish official national income figures for the years in 1929 From 1919 through 1938 Simon Kuznets in his *National Income and Its Composition, 1919–1938* (National Bureau of Economic Research), gave figures based on the original estimates of the National Bureau of Economic Research Table IV includes his figures for 1919 through 1928 and then picks up the official figures in 1929. Kuznets' figures indicated a post-World War I depression trough of $59,400,000,000 in 1921 and a climb to $81,600,000,000 in 1926; the official figures indicated a 1929

1939	173,302	7,808,205	8,097,515	24,487,304
1947	240,881	11,916,188	20,242,383	74,425,825

*Value of products less cost of materials, supplies, fuel, electricity and contract work For 1849–1933, cost of contract work was not subtracted from the value in calculating value added by manufacture
†From 1849 to 1899, inclusive, this table includes factories and hand and neighbourhood industries From 1904 on this table includes factories, but excludes hand and neighbourhood industries
‡Data for 1849–1914 include all establishments having products valued at $500 or more, from 1914 on, those having products at $5,000 or more
§Reduced to gold basis.
Source U S Department of Commerce, Bureau of the Census, 1947 "Census of Manufactures"

peak of $87,355,000,000 A yearly decline followed, to a low of $39,584,000,000 in 1933 Then came a steady climb, with a slight drop in 1938, until by 1941 the national income totalled $103,-834,000,000 Slight recessions occurred in 1945 and 1946, but 1948 marked a peak of $223,466,000,000, a figure surpassed only by an all-time high of approximately $235,000,000,000 in 1950 These national income figures include compensation of employees (both civilian and governmental), income of unincorporated enterprises (including business, professional and farming), rental income and net interest

On the basis of comparative 1949 figures released by the statistical office of the United Nations "for purposes of economic analysis," it becomes evident that the United States, with its $216,831,000,000 national income for 1949, provided for the average American the world's best annual income of $1,453. The average Russian was about one-fifth as well off with an annual income of $308, and the average Chinese was almost the world's poorest with $27 On the basis of total income, the ten "richest" nations in 1949 were as follows.

United States	$216,831,000,000
U S S R	59,300,000,000
United Kingdom	28,911,000,000
France	19,857,000,000
India	19,574,000,000
West Germany	13,300,000,000
China	12,384,000,000
Canada	11,797,000,000
Italy	10,800,000,000
Japan	8,260,000,000

Manufactures.—During the period 1849–1947 the number of manufacturing establishments almost doubled, from a total of 123,025 to 240,881. (*See* Table V.) During this same period the number of production workers in these establishments had multiplied 12 times from a total of 957,059 in 1849 to a total of 11,916,188 in 1947. The value added to the products processed

by manufacturers multiplied 160 times As reported by the 1947 "Census of Manufactures," this value in 1849 was $463,983,000 and in 1947 was $74,425,825,000 Wages paid the workers multiplied 128 times from an 1849 figure of $236,755,000 to a 1947 figure of $30,242,343,000.

Table VI shows that in number of establishments the middle Atlantic area led with 75,363 for 1947, the east north central area

TABLE VI—*Density of Manufacturing in the United States*
(money figures in thousands of dollars)

Region	Number of establishments		Value added by manufacture	
	1939	1947	1939	1947
New England	14,301	20,274	$ 2,413,068	$ 6,811,800
Middle Atlantic	53,226	75,363	7,308,760	20,790,620
East north central	38,013	50,570	7,744,496	21,473,363
West north central	14,966	17,403	1,348,167	4,110,409
South Atlantic	16,657	24,001	2,216,976	6,942,054
East south central	7,921	10,997	811,101	2,875,128
West south central	9,309	13,181	815,276	3,027,709
Mountain	1,787	3,049	169,187	839,029
Pacific	16 119	24,133	1,146,951	5,844,924
Total	173,802	240,881	24,487,312	74,495,825

Source: U.S. Department of Commerce, Bureau of the Census, 1947 "Census of Manufactures"

was second with 50,570; and the Pacific area was third with 24,133 From the measurement of value added by the manufacturer, the east north central area led with $23,473,563,000 for 1947; the middle Atlantic area was second with $20,790,626,000, and the south Atlantic area was third with $6,942,054,000.

In Table VII is shown a breakdown by industry groups for the years 1939 and 1947 on three items. the number of establishments, the number of production workers and the value added by manufacture

In the number of establishments, those manufacturing food and kindred products led all others with a count of 39,993 for 1947 In second place were establishments manufacturing apparel and related products with a 1947 figure of 30,960 and in third place were printing and publishing industries with 28,986 for 1947

In the number of production workers, establishments manufacturing nonelectrical machinery such as tractors, construction and mining machinery, machine tools and office equipment led with 1,244,135 for 1947. In second place were establishments manufacturing textile and mill products with 1,147,194, and in third place were establishments manufacturing food and kindred products, with a 1947 figure of 1,099,478

Establishments manufacturing food and kindred products also led in value added, with a 1947 figure of $9,024,912,000 In second place stood the nonelectrical machinery manufacture, with $7,812,455,000. In third place was the manufacture of transportation equipment, including among other items motor vehicles, aircraft, ships and railroad locomotives, with a 1947 figure of $5,869,196,000.

Wholesale Trade.—A comparative study of wholesale establishments for the years 1929 (with its first official "Census of Wholesale Distribution"), 1939 and 1948 shows a steady increase in the number of wholesale establishments In 1929 there were 168,262; in 1939, 199,726, an increase of almost 19% over 1929, and in 1948, 243,366, an increase of 22% over 1939 The sales of these establishments, however, showed more than a 17% decline from the 1929 figure of $66,739,607,000 to the 1939 figure of $54,888,480,000, but a sharp rise of 244% from this 1939 figure to the 1948 figure of $188,688,801,000

Included in the 243,366 wholesale establishments for 1948 were 146,518 merchant wholesalers (*see* Table VIII) with sales of $79,766,589,000, up 254% from the 1939 figure of $22,537,832,000; 23,768 manufacturers' sales branches and offices with sales of $52,738,577,000, up 270% from the 1939 figure of $14,253,609,000; 29,451 petroleum bulk stations with sales of $10,615,650,000, up 179% from the 1939 figure of $3,807,908,000; 24,361 merchandise brokers or agents with sales of $34,610,093,000, up 194% from the 1939 figure of $11,779,499,000, and 19,268 assemblers of farm products with sales of $10,957,893,000, up 337% from the 1939 figure of $2,509,632,000.

The number of employees in all wholesale establishments increased from 1,605,347 in 1939 to 2,382,789 in 1948, an increase of about 42% The pay roll for all wholesale establishments in 1948 amounted to $7,990,713,000.

Retail Trade.—The first complete measure of retailing was contained in the 1929 "Census of Retail Distribution." For that

TABLE VII—*Comparative Summary of Industry Groups*

Group	Number of establishments		Number of production workers		Value added by manufacture (in thousands of dollars)	
	1939	1947	1939	1947	1939	1947
Food and kindred products	43,667	39,993	802,133	1,099,478	$3,484,696	$9,024,912
Tobacco manufacture	761	1,086	87,325	103,289	350,152	641,356
Textile mill products	6,388	8,185	1,081,710	1,147,194	1,817,906	5,340,876
Apparel and related products	20,275	30,960	752,829	972,897	1,386,004	4,443,373
Lumber and products, except furniture	23,208	26,231	422,047	506,118	731,208	2,497,192
Furniture and fixtures	5,178	7,687	189,382	282,780	417,785	1,377,968
Paper and allied products	3,328	4,103	270,239	388,401	880,350	2,874,058
Printing and publishing industries	24,878	28,986	324,371	438,135	1,765,314	4,260,416
Chemicals and allied products	8,830	10,073	275,669	466,458	1,818,041	5,365,201
Petroleum and coal products	1,227	1,387	107,695	169,610	697,273	2,015,307
Rubber products	595	875	120,740	214,533	466,155	1,302,863
Leather and leather products	3,505	5,308	327,189	348,290	582,015	1,532,803
Stone, clay and glass products	6,678	11,650	267,094	405,755	836,321	2,306,480
Primary metal industries	3,512	5,363	672,438	1,010,055	2,168,809	5,765,434
Fabricated metal products	9,332	16,734	451,087	822,514	1,400,883	4,021,476
Machinery (except electrical)	8,860	17,906	536,082	1,244,135	2,036,965	7,812,455
Electrical machinery	1,079	3,073	247,030	639,147	941,469	3,894,115
Transportation equipment	2,012	3,711	544,553	987,142	1,772,573	5,869,196
Instruments and related products	1,292	2,297	84,867	181,030	333,409	1,080,336
Miscellaneous manufactures	8,084	14,132	241,725	327,570	629,094	2,000,168

Source: U.S. Department of Commerce, Bureau of the Census, 1947 "Census of Manufactures"

year the total sales of retail stores stemming from 1,543,158 establishments amounted to $49,114,653,000. The trough of the depression in retailing came in 1933, when sales dropped to $24,517,000,000 By 1935 from a total of 1,587,718 stores came sales of $32,791,212,000 and by 1939 from a total of 1,770,355 stores came sales of $42,041,790,000. Nine years later, however, in 1948, from a slightly lower number of stores—1,769,540—came a record sales figure of $130,520,548,000, an increase of more than 200% over 1939 Table IX shows in detail the kinds of business making up these sales figures for 1939 and 1948 The table includes figures not only for the retail outlets themselves but also for the warehouses, administrative offices and other auxiliary units serving these retail stores.

The 1948 annual pay roll for retail establishments represented about 11% of the estimated total paid to all wage earners and salaried employees in the United States for that year In 1939 to a total of 4,933,141 employees was paid the sum of $4,763,076,000; in 1948 to a total of 7,083,315 employees was paid the sum of $14,186,159,000. A comparative check of the two years shows an increase of almost 8% from 1939 to 1948 in the number of active proprietors, but virtually no change in the number of unpaid family members

It is interesting to note that about 56,000 fewer food stores were in operation in 1948 than in 1939 but about 41,000 more eating and drinking places and about 14,000 more liquor stores, the latter showing an increase of almost 75% over 1939.

The accelerated increase in population, in the building of new homes and in the migration of families was indicated in the 62% increase of 1948 over 1939 of furniture, furnishings and household appliance stores. In 1939 there were 52,827 such stores; in 1948 there were 85,585. The number of lumber, building and hardware stores likewise showed an increase over 1939, when

TABLE VIII.—*Comparative Summary of Merchant Wholesale Establishments*

Merchant wholesalers	Number of establishments			Sales for entire year (in thousands of dollars)			Number of paid employees*

Source U S Department of Commerce, Bureau of the Census, 1948 "Census of Business."

there were 79,313 such stores, in 1948 there were 98,038, an increase of more than 24%. Practically half of this increase was accounted for by farm equipment dealers.

There was a 22% decrease in the number of gasoline service stations from 1939, when there were 241,858, to 1948, when there were 188,253 such stores. The number of establishments in the automotive group, on the other hand, increased In 1939 there were 60,132; in 1948 there were 86,162, an increase of more than 44%

Service Trades.—In the nine years following 1939, the first year for which the census bureau issued figures on service trades, the country showed a slight decrease in the number of service establishments, from 570,057 in 1939 to 559,559 in 1948 (*See* Table X) Florida, however, showed a 43% gain in the number of establishments; Arizona a 40% gain, and New Mexico a 38% gain Furthermore, the number of business services such as advertising agencies and private employment agencies showed a gain of 22%, and automobile repair services and garages showed a gain of 21%.

Although the number of establishments decreased, the receipts did not Service trades reported receipts for 1948 of $8,578,162,000, an increase of 188% over the 1939 figure of $2,973,593,000 New Mexico was first, reporting a gain of 345%; Florida second with 305%; and Alabama third with 300%. Employment also increased during the period. For the work week ended nearest to Nov. 15, 1939, the count was 936,271; for the comparable 1948 period it was 1,342,496.

For the country as a whole, the annual pay roll more than tripled, increasing from a 1939 figure of $911,248,000 to a 1948 figure of $2,861,214,000.

Mineral Products.—From 1880 to 1948 the total value of all mineral products in the United States multiplied about 42½ times. The total value in 1880 was $367,463,000; in 1948 it was an estimated $15,620,000,000. (*See* Table XI.) From 1900 through 1910, with minor declines in 1904 and 1908, the total climbed from $1,108,936,000 to $1,987,844,000. By 1920, with minor declines in 1911, 1914 and 1919, the total climbed to $6,981,340,000. Beginning the next decade with a decline in 1921, there were four others. 1924, 1927, 1928 and a 1930 decline to $4,764,800,000 Beginning the next decade with a decline in 1931, which carried over to 1932, and another in 1938, the 1940 figure climbed to a total of $5,613,900,000. Through 1944 the total climbed, receded in 1945 and hit an estimated $12,393,000,000 in 1947 to achieve a high in 1948.

Of the 1948 totals, $3,690,000,000 represented the value of the production of metallic minerals, some of which are listed in Table XIII; $11,930,000,000, the value of the production of nonmetallic products, and $10,180,000,000 the value of fuels. Table XIII shows that for 1947 the most valuable metallic mineral was pig iron, with a valuation of $1,770,659,000, and the most valuable nonmetallic mineral was petroleum, with a 1947 figure of

$3,548,266,000, followed by coal, with a 1947 total of $2,975,394,000.

It is interesting to note that in 1880 (*see* Table XI) the value of fuels—including coal, natural gas, natural gasoline and allied products and petroleum—made up only 33% of the total value of all mineral products, but in 1948 the value of fuels made up 65% of the total. A glance at the petroleum value figures given in Table XII for selected years will explain one element entering into the fuels value. For example, the 1947 petroleum figure of $3,548,266,000 (*see* Table XIII) constituted 28% of the entire value of mineral production for that year, amounting to $12,393,000,000 (*see* Table XI).

In the matter of employment, there was a 37% decrease from 1911 to 1947. In 1911 there were engaged in quarries and related industries 110,954 production workers; in coal mines 728,348; and in mines other than coal 165,979, a total of 1,005,281 production workers in mineral products. In 1947 the comparable group figures were 80,300 for quarry and related industries, 469,100 for coal mines and 84,000 for mines other than coal, a total of 633,400. In 1947 wages and salaries paid to workers in the mining industries were estimated at $2,920,000,000.

Shifts in Occupations.—In 1820 the population of the continental United States was 9,638,453; of this number 6,487,875 were ten years old or more. Within this age group 2,881,000, or 44.4%, were gainfully occupied. In 1940 the United States had a population of 131,669,275, of whom 110,443,129 were ten years old or more Within this age group, 52,148,251, or 47.2%, were gainfully occupied.

While the percentage figure had increased only slightly during this 120-year period, the accelerated production and distribution of agricultural, industrial and mineral products had brought about important changes in the occupations of U.S. workers. Perhaps nowhere was this occupational change more marked than in agriculture. In 1820, for example, 71.8% of the gainfully occupied persons were engaged in agricultural pursuits. By 1880 the percentage had decreased to 49.4%, by 1900 to 34.9%, by 1920 to 25.9%, by 1940 to 22.7% and by 1948, with a labour force of 62,748,000 and with 7,973,000 engaged in agricultural pursuits, the percentage had dropped to 12.7%.

The trend in manufacturing, as would be supposed, was the opposite In 1820 only 12.2% of gainfully occupied persons were engaged in manufacturing, hand trades and construction By 1880 the percentage had increased to 18.5% By 1900, with the quickened pace of commodity processing and marketing, not only had employment in manufacturing increased, but employment in the wholesale, retail and service trades had become an important factor. In these three categories and for the period between 1900 and 1940 (*see* Table XII) manufacturing stood first in the number of employees. The figure of 6,090,000 in 1900 accounted for 22.2% of all gainfully occupied persons, and the 1940 figure of 11,288,000 accounted for 24.3% of total employment. For a comparison of the number of production workers in the various manufacturing groups for the years 1939 and 1947 *see* Table VII.

Employment in the service trades stood second to that of manufacturing, rising steadily from 1900 with 3,942,000, or 14.4% of the total, to 1940 with a high of 10,432,000, or 22.4% of the total The group including trade, distribution and finance was third, increasing from the 1900 figure of 3,224,000, or 11.7% of the total, to the 1940 figure of 7,631,000, or 16.4% of the total.

Within the larger several groupings, there were of course employment variations for individual occupations The same was true for the years 1939 to 1948 In the wholesale trade area, for example, total employees of the dairy and poultry products establishments numbered 52,342 in 1939 but 103,476 in 1948. Employment figures for these same years in furniture and home furnishing establishments rose from 18,817 to 32,187; in automotive establishments from 67,380 to 136,329; in electrical goods establishments from 38,592 to 90,448, and in hardware, plumbing and heating wholesale houses from 62,715 to 102,740. On the other hand, employment decreased in general dry goods establishments, wallpaper stores and in establishments selling farm products (raw materials).

In the retail field, women's ready-to-wear stores employment rose during this nine-year period from 143,985 to 228,881, but millinery stores employment fell from 24,569 to 11,374 Household appliance stores employment increased from 69,818 to 118,176 but that for grocery stores not selling meat decreased from 131,543 to 89,043 Radio stores employment increased from 5,783 to 14,399 and hardware stores from 57,998 to 113,165.

In the service trades for this period, there were also employment shifts In personal service shops as a whole there was increased employment, from 653,072 in 1939 to 851,024 in 1948; but there was a decline in employment both in barber and in beauty shops. Employment in cleaning and dyeing plants rose from 87,421 to 210,026. Laundries and laundry services increased employment from 266,528 to 329,728, but shoe repair shops, shoeshine parlours and hat cleaning shops decreased employment from 23,447 to 22,900.

From 1910 to 1940 the percentage of professional persons to the *total* number of employed persons increased from 4.4 to 6.5, that of proprietors, managers and officials decreased from 13.0 to 11.8; that of clerks and kindred workers increased from 10.2 to 17.2; that of skilled workers was the same at 11.7; that of semi-skilled workers increased from 14.7 to 21.0; and that of unskilled workers (there were 13,457,151 in 1940) decreased from 36.0 to 25.9.

Not only was there a shifting in occupations, but more women were employed in various jobs throughout the country. In 1890 there was a total of 3,596,615 employed women In 1940 the total was 13,770,000, an increase of 282.8%. In each age group there was a proportionate increase. In 1890 there were 2,986,668 women employed whose ages ranged from 16 to 44; in 1940 there were 10,710,000, an increase of 258.6%. In the age group from 45 to 64 the rise was from 493,750 in 1890 to 2,750,000 in 1940,

an increase of 458 6%. In the age group of 65 and over, the increase was from 98,158 in 1890 to 310,000 in 1940, or 216 2%.

Wages and Salaries.—Of the 1942 total of income from all private industry, $120,436,000,000, almost 55%, or $65,788,000,000 was paid out in wages and salaries. Of the 1949 total of income, $194,529,000,000, 58%, or $113,733,000,000, was paid out in wages and salaries.

In 1949 this average of more than 50% held true for seven of the nine classifications listed in Table XIV. Transportation payments were highest, with 77.5% of income paid out in wages and salaries. Manufacturing came next, with 69.8%, and was followed in turn by contract construction with 66.7%, mining with 66.1%, communications and public utilities with 61.2%, wholesale and retail trade with 60.9% and services with 51%. The two

Source: U S Department of Labor, Bureau of Labor Statistics.

rate nation, had its genesis in Colonial trade, of which it was in fact but a continuation under altered political auspices The early commerce of the United States was largely water-borne and consisted of coastwise traffic and trade with foreign lands. Internal commerce was decidedly primitive and confined to certain wholesaling activities of importers, the business of fur trading posts and the distribution of a limited variety of manufactures, often on a barter basis in exchange for the crude produce of the frontier, by general stores or itinerant merchants There were in existence as late as 1929, according to the "Census of Distribution," a half dozen wholesale grocers who could trace the lineage of the businesses they operated back to these early times, one having been established in 1787.

While few statistics are available on the extent of the early commerce of the United States, it appears quite certain that by far the greater portion of the total commerce was foreign trade until well into the 19th century The transition from a predominately foreign trading nation to one in which domestic trade accounted for nine-tenths or more of the total, as it did by mid-20th century, was gradual, a transition attuned closely to the waves of westward migration which settled and developed the American continent

Estimates of Total Commerce.—It is difficult to find adequate quantitative measures of the total U.S. commerce. It has been estimated that the total value at point of production or importation of all goods marketed at wholesale in the United States amounted to slightly in excess of $15,000,000,000 in 1899. The total had nearly doubled by 1910, redoubled by 1916 and reached a high point of nearly $98,000,000,000 in 1920. The depression following World War I brought the total down to less than $54,000,000,000 in 1921 The 1929 level showed recovery to nearly $84,000,000,000, after which there was a steady drop to $35,000,000,000 in 1932, the low point of the great depression of the 1930s Recovery carried the total up to more than $72,000,000,000 in 1935 but the following year saw a recession to $60,000,000,000 By 1939 the figure had grown to $67,534,000,000 World War II carried it to extreme heights By 1948 it was $215,848,000,000.

The dollar value figures are somewhat misleading because they conceal the influence of price changes When allowance is made for the price factor, much of the fluctuation is reduced. An index of the physical volume of goods marketed at wholesale in the United States stood at 36.7 at the turn of the 20th century (1935–39 = 100). Instead of doubling in ten years as the dollar value figures indicated, the physical volume index did not double until after 1916. The index stood at 78, the World War I high, in 1917, dropped to 69 7 in 1921 and rose to 111.8 in 1929. The

physical volume of goods marketed fell off to 69.1 in 1932 (or to about the same low point reached in 1921). This was a much less serious decline than was recorded by the unadjusted value figures. From 1932 the index revealed steady progress upward to 106.7 in 1937 and to 111.1 in 1939. At the World War II peak it reached 216.7 (1943). Following that war the index climbed steadily to 176 in 1948, after falling to 159.8 in 1946.

FOREIGN COMMERCE OF THE UNITED STATES

Comparison with Domestic Commerce.—It is difficult to make an adequate and equitable comparison between U.S. domestic and foreign commerce. At best, statistics are likely to mislead because of the failure to include all necessary qualifications. A few comparisons are hazarded, nevertheless, as throwing some light on this phase of United States commerce.

Since many commodities produced in the United States cannot enter export trade at all, estimates have been made of the proportion of movable goods exported Estimates of the proportion of movable goods exported for selected years after 1899 suggest an average of a little less than 10%.

A more equitable comparison lies in the figures for individual commodities because the over-all figures conceal the great importance of export markets for some of the more important products of the United States. Thus in 1933, prior to World War II, 66% of all raw cotton produced in the United States was exported. This ratio had fallen to 30% by 1938. In the latter year exports of the gum rosin production amounted to 38% In 1937, 43% of the prunes, 29% of the sardines, 19% of the production of tractors and parts, 43% of the borax and 36% of all dried

*Unilateral transfers indicate amount of contributions in kind or in cash through lend-lease, United Nations Relief and Rehabilitation administration, personal and institutional remittances and similar channels. Thus, payments or receipts under unilateral transfers in most cases effect exports or imports, respectively, of goods and services for which present or future compensation is not required

fruits were exported Furthermore, industries exporting only a small fraction of their total output sometimes found that foreign sales enabled them to step up production to a higher point with resulting reductions in unit costs of production Export sales may indeed account for a substantial part of the net earnings of a company, even though they make up only a fraction of total sales During and after World War II, however, normal foreign trade patterns were so distorted that such figures were of little value

Balance of Payments.—Widespread misunderstanding of foreign commerce arises from the overemphasis placed on exports and imports of commodities Tangible merchandise transactions are more easily observed than are other perhaps equally or even more important but less obvious transactions, which are fully as much a part of foreign commerce as is the traffic in physical goods. When service items, capital transfers and gold and silver movements as well as commodity trade are taken into account, the resulting balance of payments, as distinguished from the balance of trade, shows necessarily an equality between total export, or credit, items and total import, or debit, items Thus, in 1948 exports of goods amounted to $13,445,000,000 and imports of goods came to $7,697,000,000, while total receipts for all goods, services, capital transfers and investments were $18,373,000,000 and total payments were $18,689,000,000 Exact equality is difficult to achieve because of errors and omissions in the basic statistics. (*See* Table XVI)

One reason for the widespread ignorance of the true nature of international trade was the fact that adequate data formerly were unavailable. Estimates of the balance of international payments for the United States were compiled only from 1919, and other nations were generally behind the United States in the issuance of similar data. The United Nations attempted to fill the gap. In sharp contrast were the statistics on merchandise exports and imports, which, for the United States, were first compiled in 1790 and became available in great detail thereafter

Merchandise Trade.—Exports of merchandise from the United States averaged $42,000,000 annually during the last decade of the 18th century. By the corresponding period of the 19th century, the average approached $1,000,000,000, and that figure was exceeded in each of the three last years of that century. A rapid expansion followed which carried the total value of exports of commodities to $8,228,000,000 in 1920, a figure, however, which reflected a wartime price inflation. The $5,240,995,000 value for exported goods in 1929 probably represented a larger physical volume of merchandise, since the price level in 1920 was about 62% above that prevailing in 1929 The depression years which followed saw exports drop sharply to $1,611,016,000 in 1932 with 1933 showing very little improvement. Thereafter a steady recovery was registered to $3,349,167,000 for 1937, followed by a setback in 1938 to $3,094,440,000. The upward trend was resumed in 1939 By 1941, the year in which World War II struck sumed in 1939 By 1941, the year in which World War II struck with the products and services of other lands. The United States is ordinarily no exception Merchandise imports usually follow the trend of exports, varying with the cycles of business and of war, but expanding with the progress of the national economy Average yearly imports of merchandise were valued at $55,895,000 during the decade 1790–1800. They had doubled in value by the fourth decade of the 19th century, more than doubled again in the ten years before the Civil War and doubled a third time in the 1870s The $1,000,000,000 mark was first reached in 1903 and $5,278,000,000 was achieved in 1920. Between 1925 and 1929 merchandise imports exceeded $4,000,000,000 each year. The depression which began in late 1929 saw imports of merchandise fall off to less than $1,323,000,000 in 1932. Recovery began in 1933 and continued through 1937, when commodity im-

*General Imports 1926–33, imports for consumption 1934–49 †Not shown separately 1926–33 ‡Two-year average
Source: U.S. Department of Commerce, *Monthly Summary of Foreign Commerce* Dec 1927–49.

ports were valued at $3,009,852,000 By 1941 imports had climbed to $3,221,954,000. During World War II they ranged from $2,769,285,000 in 1942 to slightly more than $4,000,000,000 in 1945 After the war imports continued to expand steadily, exceeding $7,000,000,000 in 1948 By 1950 the differential between merchandise exports and merchandise imports had been reduced to the lowest level in many years For the month of August imports of goods actually exceeded exports in value by $58,000,000 Changes in the price level explained a part of the shifts recorded in these figures, as was noted for the export data (*See* Table XVII.)

A further consideration of importance is the fact that merchandise imports are divided into the sheep and the goats, those which are admitted into the country free and those upon which customs duties are levied Many shifts took place in the relative proportion of these two classes during the history of the United States Less than 6% of all merchandise imports on the average were free of duties in the decade 1821–30, while more than 38% came in duty free during the following ten years. At the close of the 19th century about 46% of total imports came in on the free list, while 61% were free by 1920, a ratio which held with minor variations up to the depression era of the 1930s By 1933 the ratio of free imports to the total was 63%, while by 1936 it had fallen to 57% By 1938 it had recovered to 60%. Following World War II it remained close to 60%.

The chief significance of these shifts in the proportion of duty-free imports to the total lies in the fact that they reflected changes in the structure of the economy of the United States. The upward trend in the proportion of duty-free imports paralleled a trend in commercial policy toward higher import duties Thus the explanation lies in the shifts in the kinds of goods imported rather than in any liberalization of the import restrictions

Principal Imported Commodities.—With the shift in emphasis from an agrarian to a manufacturing nation, the composition of the imports of the United States underwent extensive changes Manufactured goods gave way to raw materials and semimanufactures The expanding wealth of the country also stimulated importation of such products as coffee, tea, spices, sugar, bananas and many luxury items such as diamonds and other precious stones The discovery of new processes and the foundings of new industries were reflected in the statistics of imports and explained such items as the tremendous expansion in crude rubber imports and, later, the downward drift in silk imports.

A selected group of 27 leading commodity classifications (Table XVIII) made up more than 72% of total merchandise imports in 1949 Coffee was first on the list that year with 2,923,000,000 lb. imported, valued at $795,500,000 Petroleum and petroleum products ranked second at $477,700,000, followed in order of size by paper and paper manufactures, cane sugar, rubber and allied products and copper and copper manufactures. The rank of these items contrasted with those which predominated 20 years earlier. Raw silk was definitely the leader then, followed in order by crude rubber, coffee, cane sugar, newsprint, petroleum and products, hides and skins, furs and manufactures and fruits and nuts Fluctuations in raw silk imports illustrated what was happening continuously in a dynamic economy for many other commodities The United States imported 24,000,000 lb. of raw silk on the average in the years 1910–14 By the period 1921–25, the average had risen to 52,000,000 lb., a trend which carried the average to 75,000,000 lb. for the years 1926–30 The depression years 1931–35 reduced this average very little to 70,000,000 lb. but after 1935 there was a steady shrinkage to 60,000,000 lb in 1936, 58,000,000 lb. in 1937 and 55,000,000 lb. in 1938. By 1949 only 3,000,000 lb were imported The appearance of nylon and its wide acceptance by consumers made the future of raw silk imports look black indeed.

Leading Commodity Exports.—The trend of merchandise exports reflects the same dynamic forces continuously reshaping the contour and content of the economy of the United States In the years 1910–14 unmanufactured cotton was the number one item on the list of merchandise exports Machinery was second in rank, followed by packing-house products, petroleum and products thereof and wheat and flour. Just before the depression of the 1930s cotton continued in first place, but petroleum and its products had taken second place from machinery, which occupied third place, followed by automobiles, parts and accessories, wheat and flour and packing-house products The outstanding change in this period was the rise of the automotive industry Exports from this industry, which averaged only $24,000,000 between 1910 and 1914, had risen to $406,000,000 on the average for the years 1926–30. The postdepression year 1937, a year of business strength generally, showed exports of machinery in first place with petroleum and its products in second position. Cotton had dropped to third place with exports of $369,000,000, less than half of the 1926–30 average Automobiles, parts and accessories were in fourth place, followed by iron and steel mill products. World War II altered this pattern, and the postwar emphasis on reconstruction of Europe and Asia through the Marshall plan, combined with relief shipments, caused shifts in U S. exports. Thus, in 1949 machinery was by far the largest single export group with total sales in excess of $2,000,000,000 Grain and grain products (more than half flour) ranked second with a volume of nearly $1,500,000,000 Third in rank was unmanufactured cotton, with exports valued at $874,200,000. With more than $750,000,000, chemicals and related products ranked fourth, but very little above automobiles, parts and accessories Following close in sixth place were iron and steel mill products, valued at $732,100,000. (*See* Table XIX.)

The outstanding fact revealed by analysis of the merchandise export statistics of the United States was the growing shift in emphasis from agricultural products to manufactured products. This shift, exactly opposite to that noted in the import statistics, reflected the movement of the underlying economic structure and the increasing industrialization of the national economy.

Sources and Destination of Foreign Trade.—A study of the geographical sources of imports and destination of exports illuminates still more the changing character of U.S. foreign trade In the years between 1876 and 1880 more than half of United States imports of merchandise originated in Europe, while 83.1% of all exports went to Europe Other countries on the North American continent supplied 23.5% of U.S. imports of commodities and absorbed 19.4% of all merchandise exports. South and Middle America supplied the United States with 31.4% of all commodities imported and purchased 8.7% of all exports. Asia was a source of supply for 11.3% of all merchandise imports but took only 1.7% of all goods exported by the United States in those years. After that period, Europe became a less important source of supply relatively and a comparatively smaller market for United States exports of merchandise U S imports from Europe, which averaged 49.5% of the total in the five-year period immediately preceding World War I, had fallen to 30.3% by 1929, to 29.5% by 1932 and to 27.3% in 1937. Exports to Europe fell even more in proportion. Averaging more than three-quarters of the total by 1900, they were 62.3% in 1910–14, 44.7% in 1929 and 40.6% in 1937. This trend continued after World War II. By 1949 Europe took 34.3% of U.S. exports and supplied but 14% of total imports.

Canada (including Newfoundland) continued to take about 15% of U.S. exports, the average for the years 1926–40 being 16.5% and the post-World War II (1946–49) average being 15.3% Imports from this area trended upward from an average of 13.5% of total U S imports (1926–40) to 21% on the average following World War II and to 23.4% in 1949. Slight increases in percentages of both exports and imports were registered by North American countries south of the Rio Grande. South America, which took less than 10% of U S exports in the years between World Wars I and II, averaged 14% in the years 1946–49. Imports from South America rose from an interwar average of less than 14% of U.S. totals to more than 22% following World War II (1946–49). Exports to Asia, which had been rising prior to World War II, averaged only little above the interwar rate after 1945. Imports from Asia fell from a prewar level of about 30% of U.S. totals to an average of about 18% for 1946–49.

Apart from World Wars I and II, these geographical shifts

stemmed from the same causes which accounted for shifts in commodity content of the foreign trade of the United States The relative decline of Europe as both a market and a supplier is explained by the fact that the industrial growth of the United States paralleled that of Europe although with a time lag As the United States became an exporter of more and more manufactured goods, markets had to be sought in Asia, Latin America and Canada, since Europe had its own industrial products. Similarly, as the United States expanded industrially it had less need for European manufactures and more need for raw materials (*See* Table XX.)

Commercial Policy.—Entwined with the economic changes just discussed, and exerting a varying degree of influence upon them, were the changes in the political policy of the United States government toward its foreign trade Between 1839 and 1951, approximately 15 tariff acts were passed by the U.S. congress.

The policy of a protective tariff on some U.S products was well established by 1820. Textile products and some metals, for example, were definitely protected by that time. In 1824 duties were increased on cotton and woollen goods from 25% to 33½%. The duty on raw wool, however, reduced the protection on woollens to about 18%. The Tariff act of 1828, which was definitely protective along many lines, made a bitter issue out of the tariff, which continued intermittently thereafter. The Tariff act of 1832 continued the protective principle of the previous act. On an average, rates of duty on dutiable articles in this act were about 33% ad valorem. In the act of 1833 provision was made for a graduated reduction in duties down to a uniform rate of 20%, which was reached in 1842. Within two months after the base rate was reached, however, the Tariff act of 1842 was passed and high duties were re-enacted

The act of 1846 was moderate in its rates; most of the controversial articles paid 30% duty Cotton textiles were dutiable at 25%. This act remained in force until 1857, when still further reductions in the duties were made The rates on most articles were reduced to 24% This act continued in force until the Civil War

During the Civil War period the customs tariffs were used as one of the many means of raising revenue. The necessity for revenue backed up by the protective principle established tariff rates on a plateau that continued without a substantial decline for 50 years. Although the customs duties on imports were enacted during the Civil War, partly as compensation for internal taxes on most domestic products, the excise taxes were quickly removed after the war on most important products, leaving the tariff rates highly protective after the need for the revenue had declined

The Civil War tariffs continued with minor revisions until the general revision of 1883. This act increased the duties on some products and reduced them on others The general average of the rates, however, was not greatly changed. Under the act of 1890 the protective system was greatly extended; duties were increased and many products were removed from the free list. Compound or mixed duties were freely used, and the duties on many products were higher than ever before.

The high protective duties in the McKinley act of 1890 were strongly contested in the political campaign of 1892 and after a change of administration with the election of Grover Cleveland, congress set about revising the tariff downward. Substantial changes were made in the act of 1894 but it was far from being a free-trade bill.

In 1896 the administration changed again and a highly protective act was passed in 1897. This continued in effect for an unusually long period; namely, until 1909 when duties were increased on the average still further.

With another change of administration in 1913, a new and lower tariff act was passed which continued in effect until 1922, at which time duties were again increased all along the line in the tariff act of that year. The act of 1930 still further increased the duties on most dutiable products.

Reciprocity in Foreign-Trade Policy.—On June 12, 1934, Pres F. D. Roosevelt approved an act of congress which amended the Tariff act of 1930 and empowered him for a period of three years: "(1) to enter into foreign trade agreements with foreign governments or instrumentalities thereof, and (2) to proclaim such modifications of existing duties and other import restrictions, . . as are required or appropriate to carry out any foreign trade agreement that the President has entered into hereunder." No reduction or increase in rate of duty was permitted beyond 50 per centum, nor could any item be transferred from or to the dutiable and free lists. The importance of this act, which was extended for additional three-year periods by successive congresses, lay in the radical departure from congressional tariff making to what was called scientific tariff making. The law provided that, before concluding any trade agreement, the president should seek information and advice from the United States tariff commission, the departments of state, agriculture and commerce and such other sources as he might deem appropriate. An interdepartmental committee, headed by the department of state, was established to work out the details of the program and to prepare the basis upon which the United States was willing to enter into agreements with other nations Aid and suggestions from industry were also sought and utilized

The underlying purpose of reciprocity was to offer inducements to individual foreign nations to co-operate in a program of mutual reduction of trade barriers in the form of lower United States tariffs on items which others wished to sell, in exchange for concessions from other nations on items which the United States sought to sell. A reduction of tariff barriers generally was sought by recourse to the most-favoured-nation formula hitherto applied Originally negotiations were conducted by the U.S. with individual nations. Later the principle of multilateral negotiations was applied. Under this approach the U.S. undertook to work out reciprocally advantageous trade arrangements with several nations at the same time

The principal purpose upon the foreign trade of the United States were difficult to appraise because of the many conflicting forces at work in the world. A comparison of the statistics of U S trade with countries which entered into reciprocal agreements and those which did not indicated that the program had beneficial results.

Foreign-Trade Zones.—A further significant change in U S. foreign-trade policy dated from 1934, when congress passed "an Act to provide for the establishment, operation, and maintenance of foreign trade zones in ports of entry of the United States, to encourage foreign commerce, and for other purposes" This act was designed to encourage imports for re-exporting after sorting, grading and manipulating. No provision was made in the original act for manufacturing or exhibiting. In 1950, manufacturing and exhibiting in foreign-trade zones were authorized.

Foreign-trade zone 1 was approved Jan. 30, 1936, for New York city. This zone had a successful history, although World War II interfered with its normal activity. Apart from a shortlived zone 2 at Mobile, Ala , approved Sept 23, 1937, and revoked April 14, 1939, no other zone was established until 1946. On July 16 of that year New Orleans, La., was granted foreign-trade zone 2 Four additional zones were later approved. Foreign-trade zone 3 at San Francisco, Calif., on March 10, 1948, 4 at

Los Angeles, Calif., and 5 at Seattle, Wash., both on June 27, 1949, and 6, the first privately operated and the first inland zone, at Municipal airport, San Antonio, Tex., Nov. 29, 1949.

VIII. DEFENSE

ARMY

When George Washington took command, on July 3, 1775, of the lines of colonial militia besieging Boston, Mass., the United States army was born. Although it was still a year and a day before the Declaration of Independence, the event marked the union of the forces of the 13 separate Colonies under one head. These men were largely militia and minutemen of local communities, given to going home whenever a particular danger was past. In Jan. 1776 the Continental Congress wisely decided that the troops it had directly raised and equipped should be separate in organization from those of local communities. These "Continentals" were enlisted for longer terms, were trained more thoroughly and thereafter provided Washington with a small, but comparatively more stable, nucleus to work with, and they proved his chief reliance in the dark hours of the war. They were the beginning of a regular army.

Washington's force varied from 8,000 troops in the operations around New York to as low as 4,000 after the winter at Valley Forge and as high as 26,000 in Nov. 1779. Other generals seldom had more than 6,000 men at their command, while some of the most important work of the war was done by bands of a few hundred under Thomas Sumter or the Catawba, Francis Marion in the Peedee swamps and George Rogers Clark in the northwest.

When peace was declared, congress ordered the disbandment of the entire army except "twenty-five privates to guard the stores at Ft. Pitt and fifty-five to guard the stores at West Point." Indian disturbances on the frontier soon caused an increase, and, when Washington was inaugurated president, the number of men in service was 595.

Until 1812 the army passed through swift periods of rise and fall, an index of national fear. From a bare single regiment when the constitution went into force, it changed to 2 in 1779, 3 in 1792, 6 in 1796, 9 in 1798, 6 in 1800, 3 in 1802, 11 in 1808, though the number authorized was always much higher than the number actually in service. Under stress of the War of 1812 the army increased from 21 regiments in Jan. 1812 to a paper strength of 51 regiments a year later, though it is doubtful if a sixth of the authorized 58,000 men were ever recruited. Counting militia and local combatants, possibly 60,000 men at the most served during the war.

The regular army was reduced to 6,600 by 1820, the artillery stationed largely in the coast fortifications and the infantry in the northern, western and southern frontier posts. Just before the Mexican War the army had shrunk to an actual strength of 5,300 men, occupying more than 100 posts. When war was declared, the regular army was recruited to war strength, and about 20,000 volunteers responded to the call, many of whom had to be sent home again because they could not be outfitted. About 20,000 troops took part in the war altogether, Winfield Scott having about 10,500 with him in the Valley of Mexico.

In 1848 the troops were reduced to 8,000, scattered over the immense area to which the country had grown. The task of dealing with the Indians in the far west increased the army to a strength of 12,698 men by 1855, which it retained up to the Civil War.

Civil War to World War I.—Enlistments in the Federal army during the Civil War numbered 2,898,304, including re-enlistments. The number in service at one time was probably a little more than 1,500,000. Estimates of the men in Confederate service varied from 700,000 to 885,000. Reduction on the usual scale in the regular army was impossible after the Civil War because of the large number of troops (about 19,000) stationed in the south to support the military governments of the Reconstruction period, because of the threat of Maximilian in Mexico which sent Philip Sheridan to the border with a large command, and because of increased Indian outbreaks in the west during the Civil War and immediately afterward.

The act of 1866 provided for a regular army of 54,000 men paper strength. The actual strength was 38,540 men, which decreased until in 1878 the effective strength was less than 20,000 men. The force was well trained, however, because it saw almost constant service against the Indians in the west. At the beginning of 1896 the army numbered slightly less than 25,000 men, the smallest force in proportion to the total U.S. population at any time since the Revolutionary postwar period.

Calls for volunteers in the Spanish-American War increased the army to 216,029 men on Aug. 31, 1898. An act in 1899 authorized the president to keep the strength of the regular army at a maximum of 65,000, and in 1901 the allowable maximum was raised to 100,000 (X)

Following the Spanish-American War the army launched upon a slow but increasingly accelerated struggle to bring itself up to the forefront as a military organization. To what extent this goal was achieved was demonstrated upon the entrance of the United States into World War I in the spring of 1917. While modernization of equipment and specialized training of troops had much to do with the army's progress, two radical changes in the military organization during the first decade and a half of the 20th century had a lasting effect upon the defense establishment. The first was the establishment of a general staff corps in 1903 which provided for a policy-making group of officers to co-ordinate the specialized activities of infantry, artillery and other arms and services, and to act as a liaison organization between the field soldiers and the secretary of war and members of his civilian staff. The second, occurring in 1914, was congressional authorization for an aviation section of the U.S. army signal corps. This was the beginning of the United States air force, a sister service holding comparable rank with its historic predecessors, the army and the navy.

World Wars I and II.—After the experiences gained by the concentration of a big segment of the regular army and the mobilization of the National guard for duty on the Mexican border in 1916, and in view of the threatening aspects of the war in Europe, which had been in progress since the summer of 1914, the U.S. government realized the necessity of building up its military strength as rapidly as possible. On June 3, 1916, congress passed a national defense act which raised the authorized strength of the regular army to 287,846 officers and enlisted men and provided for a reorganized military establishment which included the national guard, the organized reserve corps and a volunteer, or emergency, army.

The dress rehearsal for the army's participation in World War I started with the mobilization of the bulk of the regular establishment and the national guard in 1916. During the war the army grew from 100,000 officers and men to 4,000,000—up until then a high-water mark of U.S. military manpower. Approximately 2,000,000 soldiers went to France under the leadership of Gen. John J. Pershing and joined forces with the French, English and other Allies to crush the Central Powers in a struggle that was primarily a trench war of relatively fixed positions. At the same time, however, these troops participated in the combat de-

velopment of effective aircraft, tanks and other fighting equipment that was destined to change the tactics, strategies and doctrines of warfare

After World War I, the U.S army experienced the usual contraction that had followed in the wake of every other conflict in which it had taken part. In World War I approximately 75% of the personnel requirements of the army were met through conscription as provided by the Selective Service act of May 18, 1917.

Another big percentage came from the citizen soldiers who comprised the national guard and those who enlisted "for the duration." With the advent of World War II, the army again went through the process of expanding from a force of about 200,000 regulars and a national guard of about the same size to an organization of more than 8,000,000 at peak strength. Its main component parts were the army ground forces, the army air force and the army service forces. The latter group was comprised of the administrative and technical services, such as the quartermaster corps, the adjutant general's department and other supply and procurement services

World War II experiences, from the outset, pointed out new lessons as well as new experiences for the U S people; and the combined political, economic, industrial, diplomatic and military representatives of the nation began to make adjustments and rearrangements in the over-all defense organization even before the war drew to a close Technological progress, electronic developments, atom- and hydrogen-bomb advancements, guided-missile inventions, aircraft perfection and other world-shaping factors contrived to "shrink" the U.S.'s protecting oceans on the east and the west. Previously, the army's history had been one of great expansion in time of emergency upon a mainland protected from attack by two wide water areas and supported by friendly neighbours, only to contract after each national crisis had been met and overcome World War II pointed up the fact that homeland security could no longer depend entirely on the protection of geography, nor could national interests remain centred exclusively in its particular section of the North American continent.

The new era of fast intercontinental transportation imposed upon the nation's military leaders a new concept of security which called for plans that would effect an extremely rapid mobilization of a strong, well-trained, modernly equipped army, as well as a full industrial and civilian mobilization to back up the fighting forces

The Army at Mid-20th Century.—Forced into an accelerated program of implementing its revised plans and policies by the large burden assumed by the United States in the United Nations' intervention in Korea, the mission of the Army at mid-20th century was threefold in its major aspects

The first was constant preparation to maintain by timely and effective military action on land the security of the continental United States, its possessions abroad and other areas vital to its interests.

Second was the formulation of workable plans for organizing, training and combining with Allied forces for land operations.

Third was the development of organization, tactics, techniques and equipment for use by army personnel in amphibious and airborne operations. These were the missions enumerated by the National Security act of 1947, the Key West and Newport agreements among the armed forces and the National Security act amendments of 1949.

Under the provisions of the Armed Services Unification act of July 26, 1947, the air force was established as a separate organization and was divorced from the control of the United States army The same act created the national military establishment (later called the department of defense), in which the secretaries of the army and the navy relinquished presidential cabinet status and, along with the secretary of the air force, reported to the secretary of defense instead of directly to the president.

At mid-century the U.S. army was reorganized in accordance with the provisions of public law 581 passed by the 81st congress on June 28, 1950. This law, known as the Army Organization Act of 1950, established the civilian control, the military directorate and the component elements of the nation's ground fighting service

Under the act, the army's civilian head is the secretary for the army His immediate assistants are an undersecretary of the army and two assistant secretaries The military head is the chief of staff He is the chief of the general staff and reports directly to the secretary of the army. On the immediate staff of the chief is a vice-chief and an allowable maximum of three deputy chiefs

In addition, there are four assistant chiefs of staff, each having supervision over a major element of the army organization. The assistant chief of staff, G-1, is in charge of personnel. Reporting to him are chiefs of the administrative services. the adjutant general, the provost marshal general and the chief of chaplains G-2 directs military intelligence activities. G-3 heads planning and operations G-4 is the logistics chief and reporting to him are the heads of the technical services, which include the chemical, medical, quartermaster, ordnance, transportation, engineer and signal corps.

The administrative and technical services listed above were included in the army service forces during World War II. While the signal corps and the corps of engineers are generally considered to be technical services, they are also classified as an arm, or combat branch, because they carry out missions as combat troops as well as engage in procurement, development and research

Each of the three combat arms provided for under the reorganization act—infantry, artillery and armour—is especially equipped and trained for its specific type of work Training of troops in the field is the responsibility of the chief, army field forces In the training programs emphasis is placed on teamwork with other arms and with elements of the sister services The results of the training are tested in combined manoeuvres and exercises held at frequent intervals

Territorial Organization.—The continental area of the United States at mid-20th century was divided into six army areas, plus the military district of Washington (D.C.), as follows:

(1) 1st army, with headquarters at Governor's Island, N.Y., and consisting of the New England states, New York and New Jersey.

(2) 2nd army, with headquarters at Ft. George G. Meade, Md., including Delaware, Pennsylvania, Maryland, Virginia, West Virginia, Kentucky and Ohio.

(3) 3rd army, with headquarters at Ft McPherson, Ga., and including North and South Carolina, Georgia, Florida, Tennessee, Mississippi and Alabama

(4) 4th army, with headquarters at Ft Sam Houston, Tex., and including Texas, New Mexico, Louisiana, Arkansas and Oklahoma.

(5) 5th army, with headquarters at Chicago, Ill., and including Illinois, Michigan, Indiana, Wisconsin, Minnesota, Iowa, Nebraska, Kansas, Missouri, Wyoming, Colorado and North and South Dakota.

(6) 6th army, with headquarters at the Presidio of San Francisco, Calif., and including California, Oregon, Washington, Montana, Idaho, Utah, Nevada and Arizona

Outside the continental limits of the United States the army had specific missions carried out by the following commands: U.S. army, Caribbean; European command; far east command; U.S forces, Austria; U.S. troops, Trieste; U.S. army, Alaska; and U.S army, Pacific.

Combat Organization.—The basic combat organization in the field is the division. It is the smallest fighting team that contains representation of all the arms and most of the services and is capable of sustaining itself over an extensive period of time in combat. Divisions are of three types—infantry, air-borne and armour—depending on the type of troops that make up the main element of the organization. An infantry division, for example, consisted at mid-century of three infantry regiments (the major element) augmented by five battalions of artillery, a tank battalion and an engineer combat battalion, a reconnaisance company, a signal company and the necessary service and supporting units.

The United States's strong military leadership and participation in the United Nations' action in Korea, which began in the latter part of June 1950, provided a realistic combat test for the organizational setup as well as the equipment and techniques of the country's land warfare establishment—just as the mobilization of the army along the Mexican border in 1916 provided a

proving ground for the evaluation of the national strength prior to World War I In view of the practical experiences gleaned from the Korean campaign, further readjustments in the make-up and mission of the army were made from time to time to keep it in combat readiness for every foreseeable emergency.

(M. B H.)

NAVY

"The genesis of the United States Navy is to be found in the maritime origins and early development of the country," wrote Commodore Dudley W. Knox in *History of the U S. Navy* (G P Putnam's Sons), recording that 2,342 U S -built vessels were included in the total of 7,694 engaged in the commerce of Great Britain in 1775. The earliest sea battles of the American Revolution were fought by small vessels armed for service by 9 of the 13 Colonies, after the battle of Lexington, and intended for the protection of local water-borne commerce

When Washington took command of the Continental army before Boston, Mass., in July 1775, he found his troops without ammunition and arranged for a ship of the Rhode Island navy to go to Bermuda for powder Soon afterward, Washington fitted out seven small vessels and manned them with seagoing troops in order to interfere with British supply ships Commodore John Manly directed this force and commanded the most successful of the vessels, capturing in one British ship a quantity of munitions which was equivalent to the manufacturing capacity of the Colonies for about 18 months On Oct 13, 1775, the Continental Congress voted to fit out ships, and the marine committee, later appointed, sent the first Continental squadron to the Bahamas for the purpose of capturing munitions The ships came back with 71 cannon, 15 brass mortars and considerable powder.

Congress declared all British vessels subject to capture and authorized privateering.

In the aggregate, the Continental navy comprised about 60 ships and made an impressive showing Among the former merchant seamen who commanded the ships, Esek Hopkins, John Paul Jones, John Barry, Lambert Wickes, Nicholas Biddle, Joshua Barney, Samuel Nicholson, Gustavus Conyngham, Henry Johnson and Abraham Whipple were especially competent. Jones was the hero of the most notable exploit, and his reply, "I have not yet begun to fight," gave the navy an imperishable tradition. In addition to cruising against enemy merchantmen and British blockaders, the Continental vessels were required to make many voyages carrying diplomatic representatives and essential cargoes Arrangements for the administration of the Continental vessels were not efficient, and the shortage of money imposed severe handicaps. Privateering offered much better financial inducements, and made recruiting difficult

Together the Continental navy and the privateers touched the pocketbook-nerve of British merchants and each one of the many petitions to the king praying for ending of the war stressed the severe losses which the English mercantile community was suffering

In 1776, after their retreat from Canada, Benedict Arnold and his troops built a flotilla of small vessels on Lake Champlain Ships of the royal navy in the St. Lawrence river contributed trained men and enabled the British to outbuild Arnold and to destroy his vessels off Valcour Island, in Oct. 1776, in the only "fleet" action involving Americans during the war Arnold had so delayed the British, however, that they were unable to advance southward until 1777, by which time Washington and the Continental Congress were able to assemble the army which captured Gen. John Burgoyne at Saratoga, N Y. This victory led to the alliance with France.

The royal navy enabled the British army to reduce Savannah, Ga., Charleston, S.C., and Wilmington, N.C.; it ravaged the coast of Connecticut, burned Norfolk, Va., Falmouth, Me., and other coastal towns while enabling the British army to strike at will along the seaboard. By 1778 Washington realized that he needed a superior French fleet to enable him to inflict a truly decisive defeat on the British, and thereafter he constantly urged on Benjamin Franklin in Paris the need for ships rather than French troops In the battle of the Capes of Virginia, Sept. 5, 1781, a powerful British fleet was defeated by the comte de Grasse. The presence of the French fleet prevented the royal navy from rescuing the British from the Yorktown peninsula, and Washington forced the surrender of Lord Cornwallis.

After the Revolution the Continental navy was disbanded and the vessels sold The first congress, under the constitution, provided for an army but decided that a navy was not necessary. Destruction of U.S commerce by the Barbary States caused congress to authorize the building of six frigates in 1794 and to establish the navy department in 1798.

Successes in the quasi war with France in 1798 and in the Barbary Wars gave Thomas Truxtun, Edward Preble and Stephen Decatur national reputations and provided the young navy with experience and self-confidence

The War of 1812 grew out of British impressment of U.S. seamen and other grievances connected with U.S. commerce New England was not enthusiastic about the war, while the whole country was disappointed by the U S army's failure to occupy Canada The overwhelming size of the British navy made possible a damaging blockade of all principal ports, enabled the British to capture and burn Washington, D.C, to attack Baltimore, Md., New Orleans, La., and various coastal towns, while driving U.S shipping from the seas U S. victories in a number of frigate actions were helpful in keeping up the national spirit; they added to the prestige of the navy and to the reputations of John Rodgers, Charles Stewart, Isaac Hull and David Porter. Thomas Macdonough defeated a British squadron on Lake Champlain and prevented an invasion. Oliver Hazard Perry captured a British naval force on Lake Erie, thus forcing British troops out of Ohio and Detroit, and preserving the states to the westward These timely naval victories on the lakes made possible the favourable peace terms of the treaty of Ghent In the battle of New Orleans, Andrew Jackson acted on sound advice from Commodore Daniel T. Patterson and employed naval forces in a decisive manner.

Between 1815 and 1861 the U.S. navy appeared in seaports all over the world, assisted commerce, made treaties in the near east and far east, explored and surveyed unfamiliar areas, conducted many scientific expeditions and had a major share in ending piracy as well as suppressing the slave trade. The Naval academy was established in 1845 by George Bancroft, the historian, then secretary of the navy.

In the Mexican War, 1846–47, the navy took over California and administered the government, besides escorting and landing the army at Vera Cruz for the capture of Mexico City.

When the Civil War began in 1861, the navy had about 10,000 officers and men and 90 ships. Only 42 of these ships were in commission and only 12 in the home squadron. Many able and experienced officers "went south" and built the Confederate navy, with the assistance of about 2,000 guns and 11 ships captured with the Norfolk navy yard On April 19, 1861, Pres. Abraham Lincoln proclaimed a blockade of all southern ports To many it seemed absurd to propose to blockade 3,000 mi. of seacoast with a small navy. Secretary of the Navy Gideon Wells, ably seconded by Gustavus Fox, assistant secretary, started immediately at the mouth of the James river, and before the end of Dec 1861, more than 150 ships had been captured in attempting to evade the blockade In November, Adm Samuel du Pont took Port Royal sound and established a base for blockading vessels. The blockade isolated the Confederate states, cut off overseas supplies of munitions, and was the most decisive factor in the Union victory. On Nov. 7, 1861, Mississippi river gunboats assisted in a victory at Belmont, Mo., and close co-operation between Commodore Andrew Foote of the navy and Gen. Ulysses S. Grant began The navy closed the Mississippi to Confederate use and cut off the southern states west of the river. David G Farragut distinguished himself in the capture of New Orleans, in operations on the lower Mississippi and at Mobile bay. He became the first rear admiral and later the first admiral David D. Porter, S. F du Pont, S. P. Lee and others also distinguished themselves in a navy which grew enormously before the war's end in 1865.

On March 8, 1862, the steam frigate "Merrimac," converted by the Confederates into an ironclad, appeared in Hampton Roads, Va., and sank two Union vessels, the "Cumberland" and the "Congress." For a time it was feared that the "Merrimac" could destroy the blockade, but on the very next day she was met by the "Monitor" in an epic fight, and she did not attack again Southern cruisers and privateers did not destroy large numbers of Union vessels, but the actual destruction combined with the very high insurance rates ruined the U.S. merchant marine, which never recovered its previous prosperity

Although the Union navy had been the decisive element in the Civil War, it was neglected for many years In spite of naval stagnation the U.S. Naval institute was established in 1873, for the advancement of professional, literary and scientific knowledge in the navy. The Naval War college was established by Commodore Stephen B Luce in 1885, and, in 1890, a member of its staff, Capt. Alfred Thayer Mahan, published *The Influence of Sea Power upon History, 1660–1783* Mahan's writings brought him academic honours at home and abroad, and the presidency of the American Historical association in 1902.

In 1883 congress appropriated money for building four steel warships and the navy took the radical step of insisting that the steel be of domestic manufacture, thus requiring the production of better steel in the United States. The navy assisted in two notable arctic expeditions, "Jeannette" and "Greely," and continued to foster overseas commerce. In the Spanish-American War, 1898, Adms. William Sampson and W. S. Schley defeated the Spanish fleet outside Santiago de Cuba, while Commodore George Dewey won a complete victory over another Spanish fleet in Manila bay. These two naval victories, at a cost of one man killed, practically ended the war.

The U S navy grew steadily in power and efficiency between 1898 and 1917. Pres. Theodore Roosevelt provided much of the impetus for the growth and aided in the national popularity of the service He ordered a cruise around the world in 1907–08 which improved efficiency and had valuable diplomatic effects. In 1915 the office of the chief of naval operations was established, and in 1916 an important shipbuilding program, influenced largely by Japanese actions, was begun. During World War I, U S. naval vessels did not participate in any sea battles, but the navy was expanded eightfold and performed many important duties. The sea power of Great Britain, seconded by French and Italian fleets, had prevented a German victory in spite of the successes of the German armies. In April 1917, just after the U S entry into the war, German submarines were sinking Allied merchantmen at an alarming rate, but the assistance of U.S destroyers, the adoption of the convoy system and a huge shipbuilding program in the U S. overcame this threat. The navy laid an enormous anti-submarine mine field in the North sea, sent a battleship division to join the British grand fleet and a second division to Bantry bay to guard against heavy raiders, sent a naval aviation bombing squadron to France, provided a battery of heavy guns on railway carriages for the western front and transported more than 1,000,000 troops to France.

World War II.—After the beginning of World War II in 1939, the U S. navy began a huge building program of planes, warships, merchant ships, landing craft and various special types. A patrol was instituted in the Atlantic in 1939, Iceland was occupied in 1941 and the escort of convoys began in 1941. After the disastrous Pearl Harbor attack of Dec. 7, 1941, the U.S. navy helped seize French Morocco in Nov. 1942, and landed U.S. troops in Morocco and Algiers. It furnished sea and naval air strength for the seizure of Sicily, Salerno, Anzio and southern France . While combatting German undersea warfare in the Atlantic, the navy furnished convoy escorts and special search groups including aircraft carriers, planes, destroyers and special anti-submarine vessels. In the Normandy landings of June 1944, the navy supplied large numbers of amphibious ships, landing craft, etc., as well as combat ships for fire support for troops. German Gens Erwin Rommel and Karl von Rundstedt reported, at the time, that the close fire support delivered by war vessels was decisive in aiding U S. troops to seize and hold positions. After the Pearl Harbor attack, Japanese amphibious forces made landings in Malaya, the Philippines, South Pacific islands, New Guinea and the Netherlands Indies. Early in 1942 the Japanese were building up Rabaul as a great base and on May 8, 1942, in the battle of the Coral sea, fought by carrier planes, the U S navy checked the Japanese in their expansion southeastward On June 4, 1942, the decisive battle of Midway was fought Japanese battleships, cruisers, destroyers and submarines, as well as amphibious vessels, were in the area, and U.S. cruisers, destroyers and submarines; but the heavy blows were struck by carrier planes, and Japan lost its four best carriers together with all their planes and almost all their pilots The U S navy suffered heavy casualties among carrier pilots and lost one of three carriers present, but to the Japanese the result was devastating.

Both the U.S. and Japanese navies had done far more than other navies in integrating aviation in their fleets Japan began the war with excellent carriers and well-trained carrier pilots The heavy losses in pilots at Coral sea and Midway were augmented in the battle of Santa Cruz and by misusing carrier pilots on shore at Rabaul later on In consequence, Japan never replaced its "first team" of carrier pilots. In Aug. 1942 the U.S. marines landed on Guadalcanal in the Solomons, and this area became a battleground for six months. The naval battles of Savo Island, eastern Solomons, Cape Esperance, Santa Cruz, Guadalcanal and Tassafarongo were costly to the U.S. navy but even more costly to the Japanese Later, the U.S navy, with amphibious, carrier task forces and gunfire support forces, fought westward through the Solomons, Bismarcks, Admiralty Islands, Marshall Islands and Carolines, while Gen Douglas MacArthur's troops were working westward on New Guinea On June 15, 1944, Adm. R. A. Spruance struck the inner ring of Japanese defenses by landing marines on Saipan, and on June 19 fought the battle of the Philippine sea, which resulted in a further heavy loss of Japanese carrier pilots and planes, as well as two Japanese carriers sunk by submarines In anticipation of heavy attacks by planes coming from the westward, Spruance placed battleships, cruisers and destroyers in position many miles from his more vulnerable carriers, under Adm. Marc S. Mitscher, and suffered only minor damage to his ships. Other important battles, involving large forces, were fought at Lingayen gulf, Iwo Jima and Okinawa The battle for Leyte gulf, fought Oct. 25, 1944, and involving three important separate engagements, was one of the decisive naval victories of the war, along with Midway and the Philippine sea. Sea power was decisive in the Pacific, bringing Japan to impotency by destroying its merchant marine through submarine warfare, destroying its fleet and leaving great bases like Rabaul and Truk with large garrisons to die on the vine, throttled by U S. naval control of the seas and the air above them. Adms. E. J. King, C. W. Nimitz, W. F. Halsey, R A. Spruance, H. K. Hewitt, T. C. Kinkaid and R. K. Turner gained fame by their successes (*see* also WORLD WAR II).

IX. CONSTITUTION AND GOVERNMENT

The following pages contain the constitution of the United

States and the 22 amendments (with dates declared effective)

CONSTITUTION OF THE UNITED STATES OF AMERICA

PREAMBLE

We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

Article. I.

Section. 1. All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives

Section. 2. The House of Representatives shall be composed of Members chosen every second Year by the People of the several States, and the Electors in each State shall have the Qualifications requisite for Electors of the most numerous Branch of the State Legislature.

No Person shall be a Representative who shall not have attained to the Age of twenty five Years, and been seven Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State in which he shall be chosen.

Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three fifths of all other Persons The actual Enumeration shall be made within three Years after the first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct. The Number of Representatives shall not exceed one for every thirty Thousand, but each State shall have at Least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose three, Massachusetts eight, Rhode Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies

The House of Representatives shall chuse their Speaker and other Officers; and shall have the sole Power of Impeachment.

Section. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote

Immediately after they shall be assembled in Consequence of the first Election, they shall be divided as equally as may be into three Classes. The Seats of the Senators of the first Class shall be vacated at the Expiration of the second Year, of the second Class at the Expiration of the fourth Year, and of the third Class at the Expiration of the sixth Year, so that one third may be chosen every second Year; and if Vacancies happen by Resignation, or otherwise, during the Recess of the Legislature of any State, the Executive thereof may make temporary Appointments until the next Meeting of the Legislature, which shall then fill such Vacancies.

No Person shall be a Senator who shall not have attained to the Age of thirty Years, and been nine Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State for which he shall be chosen.

The Vice President of the United States shall be President of the Senate, but shall have no Vote, unless they be equally divided.

The Senate shall chuse their other Officers, and also a President pro tempore, in the Absence of the Vice President, or when he shall exercise the Office of President of the United States

The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation When the President of the United States is tried, the Chief Justice shall preside. And no Person shall be convicted without the Concurrence of two thirds of the Members present.

Judgment in Cases of Impeachment shall not extend further than to removal from Office, and disqualification to hold and enjoy any Office of honor, Trust or Profit under the United States· but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Law

Section. 4. The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by Law make or alter such Regulations, except as to places of chusing Senators.

The Congress shall assemble at least once in every Year, and such Meeting shall be on the first Monday in December, unless they shall by Law appoint a different Day.

Section. 5. Each House shall be the Judge of the Elections, Returns and Qualifications of its own Members, and a Majority of each shall constitute a Quorum to do Business; but a smaller Number may adjourn from day to day, and may be authorized to compel the Attendance of absent Members, in such Manner, and under such Penalties as each House may provide.

Each House may determine the Rules of its Proceedings, punish its Members for disorderly behaviour, and, with the Concurrence of two thirds, expel a Member

Each House shall keep a Journal of its Proceedings, and from time to time publish the same, excepting such Parts as may in their Judgment require Secrecy; and the Yeas and Nays of the Members of either House on any question shall, at the Desire of one fifth of those Present, be entered on the Journal

Neither House, during the Session of Congress, shall, without the Consent of the other, adjourn for more than three days, nor to any other Place than that in which the two Houses shall be sitting

Section. 6. The Senators and Representatives shall receive a Compensation for their services, to be ascertained by Law, and paid out of the Treasury of the United States They shall in all Cases, except Treason, Felony and Breach of the Peace, be privileged from Arrest during their Attendance at the Session of their respective Houses, and in going to and returning from the same; and for any Speech or Debate in either House, they shall not be questioned in any other Place.

No Senator or Representative shall, during the Time for which he was elected, be appointed to any civil Office under the Authority of the United States, which shall have been created, or the Emoluments whereof shall have been increased during such time, and no Person holding any Office under the United States, shall be a Member of either House during his Continuance in Office.

Section. 7. All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as on other bills.

Every Bill which shall have passed the House of Representatives and the Senate, shall, before it becomes a Law, be presented to the President of the United States; If he approve he shall sign it, but if not he shall return it, with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House, by which it shall likewise be reconsidered, and if approved by two thirds of that House, it shall become a Law. But in all such Cases the Votes of both Houses shall be determined by yeas and Nays, and the Names of the Persons voting for and against the Bill shall be entered on the Journal of each House respectively If any Bill shall not be returned by the President within ten Days (Sundays excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law.

Every Order, Resolution, or Vote to which the Concurrence of the Senate and House of Representatives may be necessary (except on a question of Adjournment) shall be presented to the President of the United States; and before the Same shall take Effect, shall be approved by him, or being disapproved by him,

shall be repassed by two thirds of the Senate and House of Representatives, according to the Rules and Limitations prescribed in the Case of a Bill

Section. 8. The Congress shall have Power To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all Duties, Imposts and Excises shall be uniform throughout the United States;

To borrow Money on the credit of the United States;

To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

To establish an uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;

To provide for the Punishment of counterfeiting the Securities and current Coin of the United States;

To establish Post Offices and Post Roads;

To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

To constitute Tribunals inferior to the supreme Court;

To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captures on Land and Water;

To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

To provide and maintain a Navy;

To make Rules for the Government and Regulation of the land and naval Forces;

To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;

To provide for organizing, arming, and disciplining the Militia, and for governing such Part of them as may be employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress;

To exercise exclusive Legislation in all Cases whatsoever, over such District (not exceeding ten Miles square) as may, by Cession of particular States, and the Acceptance of Congress, become the Seat of the Government of the United States, and to exercise like Authority over all Places purchased by the Consent of the Legislature of the State in which the Same shall be, for the Erection of Forts, Magazines, Arsenals, dock-Yards, and other needful Buildings;—And

To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof

Section. 9. The Migration or Importation of such Persons as any of the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight, but a Tax or duty may be imposed on such Importation, not exceeding ten dollars for each Person.

The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it.

No Bill of Attainder or ex post facto Law shall be passed.

No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken

No Tax or Duty shall be laid on Articles exported from any State.

No Preference shall be given by any Regulation of Commerce or Revenue to the Ports of one State over those of another: nor shall Vessels bound to, or from, one State, be obliged to enter, clear, or pay Duties in another.

No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law, and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time

No Title of Nobility shall be granted by the United States. And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince, or foreign State.

Section. 10. No State shall enter into any Treaty, Alliance, or Confederation, grant Letters of Marque and Reprisal, coin Money; emit Bills of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts; pass any Bill of Attainder, ex post facto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility.

No State shall, without the Consent of the Congress, lay any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing its inspection Laws and the net Produce of all Duties and Imposts, laid by any State on Imports or Exports, shall be for the Use of the Treasury of the United States; and all such Laws shall be subject to the Revision and controul of the Congress

No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War, unless actually invaded, or in such imminent Danger as will not admit of delay.

ARTICLE. II.

Section. 1. The executive Power shall be vested in a President of the United States of America He shall hold his Office during the Term of four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows

Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress, but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector

The Electors shall meet in their respective States and vote by Ballot

[illegible]

tinct[illegible] the States, and a Majority of that[illegible] shall be necessary to a Choice In every Case, after the Choice of the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But if there should remain two or more who have equal Votes, the Senate shall chuse from them by Ballot the Vice President.

The Congress may determine the Time of chusing the Electors, and the Day on which they shall give their Votes, which Day shall be the same throughout the United States.

No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any Person be eligible to that Office who shall not have attained to the Age of thirty five Years, and been fourteen Years a Resident within the United States.

In Case of the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the Same shall devolve on the Vice President, and the Congress may by Law provide for the Case of Removal, Death, Resignation or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be encreased nor diminished during the Period for which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any of them

Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation —"I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States."

Section. 2. The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any Subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment

He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur, and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided for, and which shall be established by Law: but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the President alone, in the courts of Law, or in the Heads of Departments.

The President shall have Power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

Section. 3. He shall from time to time give to the Congress Infor-

mation of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the Time of Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers, he shall take Care that the Laws be faithfully executed, and shall Commission all the Officers of the United States

Section. 4. The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

ARTICLE. III

Section. 1. The judicial Power of the United States shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behavior, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

Section. 2. The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority;—to all Cases affecting Ambassadors, other public Ministers and Consuls;—to all Cases of admiralty and maritime Jurisdiction;—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and Citizens of another State,—between Citizens of different States,—between Citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects

In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make

The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed, but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed

Section. 3. Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court

The Congress shall have power to declare the Punishment of Treason, but no Attainder of Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attainted

ARTICLE. IV.

Section. 1. Full Faith and Credit shall be given in each State to the public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof

Section. 2. The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States

A person charged in any State with Treason, Felony, or other Crime, who shall flee from Justice, and be found in another State, shall on Demand of the executive Authority of the State from which he fled, be delivered up, to be removed to the State having Jurisdiction of the Crime.

No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.

Section. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the Jurisdiction of any other State; nor any State be formed by the Junction of two or more States, or Parts of States, without the Consent of the Legislatures of the States concerned as well as of the Congress.

The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States, and nothing in this Constitution shall be so construed as to Prejudice any Claims of the United States, or of any particular State.

Section. 4. The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened) against domestic Violence.

ARTICLE. V

The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress; Provided that no Amendment which may be made prior to the Year One thousand eight hundred and eight shall in any Manner affect the first and fourth Clauses in the Ninth Section of the first Article; and that no State, without its Consent, shall be deprived of its equal Suffrage in the Senate

ARTICLE. VI.

All Debts contracted and Engagements entered into, before the Adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation

This Constitution, and the Laws of the United States which shall be made in Pursuance thereof, and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding

The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution, but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States

ARTICLE. VII.

The Ratification of the Conventions of nine States shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same

done in Convention by the Unanimous Consent of the States present[1] the Seventeenth Day of September in the Year of our Lord one thousand seven hundred and Eighty-seven and of the Independence of the United States of America the twelfth In Witness whereof We have hereunto subscribed our Names,

AMENDMENTS TO THE CONSTITUTION OF THE UNITED STATES

"*Resolved*, By the Senate and House of Representatives of the United States of America, in congress assembled, two-thirds of both Houses concurring, that the following articles be proposed to the Legislatures of the several States, as amendments to the Constitution of the United States, all or any of which articles, when ratified by three-fourths of the said Legislatures, to be valid to all intents and purposes, as part of the said Constitution, namely "

THE TEN ORIGINAL AMENDMENTS
(Dec. 15, 1791)

Article I—Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press, or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances

Article II—A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed

Article III—No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war, but in a manner to be prescribed by law

Article IV—The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

Article V—No person shall be held to answer for a capital or other infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war or public danger, nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law, nor shall private property be taken for public use without just compensation

Article VI—In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which districts shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him, to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defence.

Article VII—In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law

Article VIII—Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted

Article IX—The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

Article X—The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

Article XI—(Jan 8, 1798)—The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States, by citizens of another State, or by citizens or subjects of any foreign state.

Article XII—(Sept 25, 1804)—The electors shall meet in their respective States and vote by ballot for President and Vice President one of whom, at least, shall not be an inhabitant of the same State with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice President, and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate;—The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted;—The person having the greatest number of votes for President, shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice President shall act as President, as in the case of the death or other constitutional disability of the President.—The person having the greatest number of votes as Vice President, shall be the Vice President, if such number be a majority of the whole number of electors appointed, and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

Article XIII—(Dec. 18, 1865)—1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

2. Congress shall have power to enforce this article by appropriate legislation

Article XIV—(July 28, 1868)—1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws

2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male members of such State, being of twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

3 No person shall be a Senator or Representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid and comfort to the enemies thereof But Congress may, by a vote of two-thirds of each House, remove such disability

4. The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection and rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave, but all such debts, obligations, and claims shall be held illegal and void.

5. The Congress shall have power to enforce by appropriate legislation the provisions of this article.

Article XV—(March 30, 1870)—1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude

2 The Congress shall have power to enforce the provisions of this article by appropriate legislation.

Article XVI—(Feb 25, 1913)—The Congress shall have power to lay and collect taxes on incomes, from whatever sources derived, without apportionment among the several States, and without regard to any census or enumeration.

Article XVII—(May 31, 1913)—1 The Senate of the United States shall be composed of two Senators from each State, elected by the people thereof, for six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislatures

2. When vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the people fill the vacancies by election as the Legislature may direct

3. This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

Article XVIII—(Jan. 29, 1919)—1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation

3 This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several

States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress

Article XIX—(Aug 18, 1920)—1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex.

2. The Congress shall have power by appropriate legislation to enforce the provision of this article.

Article XX—(Feb. 6, 1933)—1. The terms of the President and Vice-President shall end at noon on the 20th day of January, and the terms of Senators and Representatives at noon on the 3rd day of January, of the years in which such terms would have ended if this article had not been ratified, and the terms of their successors shall then begin.

2. The Congress shall assemble at least once in every year, and such meeting shall begin at noon on the 3rd day of January, unless they shall by law appoint a different day.

3. If, at the time fixed for the beginning of the term of the President, the President elect shall have died, the Vice-President elect shall become President. If a President shall not have been chosen before the time fixed for the beginning of his term, or if the President elect shall have failed to qualify, then the Vice-President elect shall act as President until a President shall have qualified, and the Congress may by law provide for the case wherein neither a President elect nor a Vice-President elect shall have qualified, declaring who shall then act as President, or the manner in which one who is to act shall be selected, and such person shall act accordingly until a President or Vice-President shall have qualified

4. The Congress may by law provide for the case of the death of any of the persons from whom the House of Representatives may choose a President whenever the right of choice shall have devolved upon them, and for the case of the death of any of the persons from whom the Senate may choose a Vice-President whenever the right of choice shall have devolved upon them.

5. Sections 1 and 2 shall take effect on the 15th day of October following the ratification of this article.

6 This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission

Article XXI—(Dec. 5, 1933)—1. The Eighteenth Article of amendment to the Constitution of the United States is hereby repealed.

2 The transportation or importation into any State, Territory, or possession of the United States for delivery or use therein of intoxicating liquors, in violation of the laws thereof, is hereby prohibited

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by conventions in the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

Article XXII—(Feb 26, 1951)—1 No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of the President more than once But this Article shall not apply to any person holding the office of President when this Article was proposed by the Congress, and shall not prevent any person who may be holding the office of President, or acting as President, during the term within which this Article becomes operative from holding the office of President or acting as President during the remainder of such term.

2. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission to the States by the Congress.

GOVERNMENT

An account of the governmental system of the United States must be largely descriptive of the organization of national and state governments But it must also analyze certain of the fundamental characteristics that distinguish the United States government from other governments. Bearing this twofold object in mind, it will be convenient to discuss the general characteristics first, and to follow with a description of governmental organization. Under this plan, the discussion of the constitution and government of the United States is organized on the following plan:

(1) Federal system; (2) written constitutions; (3) judicial construction of written constitutions; (4) separation of powers; (5) presidential system of executive organization; (6) national government; (7) state governments; (8) local government in the states; (9) elections and political parties.

1. FEDERAL SYSTEM

By the Declaration of Independence in 1776, the 13 American colonies of Great Britain expressed their action as that of "these united colonies," but the terms of the declaration implied that each became an independent state. The 13 united in declaring independence and in the conduct of war, though their co-operation was largely ineffective The Articles of Confederation, adopted in 1781, constituted a legal symbol of union, but the central government under these articles had no coercive power over the states and no power whatever capable of exercise directly upon the citizens of the states The national constitution, framed in 1787 and put into effect in 1789, was intended to remedy this situation by creating a central government with large powers and with authority to exercise these powers, not merely upon the states, but directly upon all citizens of the country When the first congress of the United States under the constitution of 1787 assembled in New York in April 1789, the union had a membership of 11 states North Carolina and Rhode Island soon joined their sisters of the original 13 states

Share of States in the Government of the Nation.—Under the federal principle in the United States, the states, as such, are constitutionally guaranteed their territorial integrity and are expressly recognized as units in the organization of national government They have equal representation in the United States senate. They are treated as units in the election of president and vice-president and of members of the federal house of representatives. They have a decisive share in the amendment of the constitution of the United States.

When the national government was being formed, a sharp conflict of interests arose between the small states and the large states The smaller states contended for complete equality among the states in the organization of the national government, and the larger states contended for influence in proportion to population A compromise was reached by which the states are equally represented in the United States senate, irrespective of population, and in proportion to their population in the house of representatives By the terms of the constitution no state may without its consent be deprived of its "equal suffrage in the Senate"

Representation in the national house of representatives is based upon population. Under the constitution, each ten years, after the decennial federal census, the congress of the United States determines how many members will constitute the house of representatives. This number is then divided into the total population of the 48 states. In this manner a ratio of representation is obtained. Each state is entitled to as many representatives as this ratio is contained in its population, although each state, no matter how small its population, is entitled to at least one representative. After the division of the representative ratio into the population of each of the states, large fractions of population may remain; and the states having the largest remainders received additional representatives, as long as the number agreed upon was not exceeded. The problem of fractions presented difficulties. A method known as the method of major fractions was used in 1910; choice of several methods of computation was provided by an act of 1929; and by act of 1941 the method known as the method of equal proportions was adopted No apportionment was made after the census of 1920, and provision was made in 1929 for automatic reapportionment of the existing number of representatives in case congress did not enact an apportioning act within 60 days after receiving the decennial statistical information on which apportionment is based. By act of 1941 automatic decennial reapportionment was provided without change in the existing number of representatives. The number of representatives and the method of apportionment are subject to change by congress

In the election of the president and vice-president of the United States, the framers of the national constitution provided for so-called electoral colleges. Each state chooses a number of presidential electors equal to the number of its members in the national house of representatives, plus its two senators The plan of the constitution was that these electors should actually exercise a choice as to who should be president. However, almost since the beginning of the government, candidates for the presidency and vice-presidency have been nominated by the great political parties of the country in advance of the choice of electors. These political parties also nominate within each state their candidates for presidential electors. The candidates of any party for electors are definitely pledged in advance to vote for the candidates nominated by that party for president and vice-president. For this

reason, everybody knows who will be president immediately after the November election, at which the electors themselves are chosen In this respect, unwritten law, developed by usage, has altered the operation of the written text of the constitution In recognition of the fact that presidential electors are merely a device for casting a certain number of votes allotted to the state, at least one-third of the states now provide for a direct vote for candidates for president and vice-president and omit from their ballots the names of candidates for presidential electors. Although each state has power to appoint its presidential electors in such a manner as the legislature thereof may direct, each state has, except in a few cases, chosen such electors by popular vote, its electoral vote then being cast for the presidential candidate with the larger popular vote in the state, even though such vote may not have been a majority.

A constitutional amendment submitted by Sen. Henry Cabot Lodge of Massachusetts would alter this plan By it, for example, if a state having eight house members together with two senators (constituting ten electoral votes) had 400,000 votes for presidential candidates, 200,000 for one candidate, 160,000 for another and 40,000 for another, the whole electoral vote would not go for the first candidate. Instead, the first candidate would receive five electoral votes, the second four and the third one.

The great political parties nominate candidates in national nominating conventions, which usually meet in June or July preceding the November election for the choice of presidential electors These conventions are composed of delegates chosen either by primary elections or by party conventions in the states. In the Democratic convention each state is represented by a number of delegates equal to twice the number of the state's combined representation in the senate and house of representatives of the United States. In the national Republican convention the representation of the states in the two houses of congress is also taken as a basis. But additional representation is given in each convention for favourable popular voting in the preceding presidential election The states may, however, properly be regarded as units in the machinery for nominating party candidates. And in the nomination of presidential candidates, a populous state wields a large influence—an influence greatly magnified if the state is both populous and politically doubtful

Two methods are provided for amending the constitution of the United States An amendment may be proposed by two-thirds of the members of both houses of congress and goes into effect when ratified by the legislatures of three-fourths of the states, or by conventions in three-fourths of the states, as congress shall determine Congress is required by the constitution to call a convention for proposing amendments, on the application of the legislatures of two-thirds of the several states No such convention has ever been called, and until 1933 congress always provided for the ratification of federal amendments by state legislatures rather than by conventions called for this purpose. In 1933 congress chose the alternate method of ratification by state legislatures and submitted the question of repealing the 18th amendment to state conventions Adopted later in the year, this proposal became the 21st amendment.

The states as governmental units still have a decisive influence with respect to any change in the national constitution. In other respects, so far as they influence the organization and government of the nation, they have tended to become merely units for national election purposes. The state has to a large extent lost its political individuality as a unit in the government of the nation. The decreased political importance of the state as a unit in national affairs was caused mainly by the development of rapid means of travel and of communication. The constant shifting of population from one state to another prevented the newer states from developing the solidarity possessed by the original 13. The very increase in the number of states also reduced the importance of each as a unit in the national government.

Not only this, but, since the establishment of the federal system, national politics has dominated. The ambitious political leader looks to advancement from state to national office. Nominations for the presidency are the most conspicuous prizes in the political organization. The popular election of United States senators by each state under the 17th amendment itself tended to reduce emphasis upon the state as a political unit and to treat it as merely an electoral area in the organization of the national government While the states still determine affirmatively who shall vote in state and national elections, the 15th and 19th amendments forbid discrimination because of race, colour, previous condition of servitude or sex, and the United States supreme court held that the 14th amendment forbids state legislation with respect to like discriminations in party primaries. Of all the states, Maine alone still adheres to a date for state elections different from that for national elections As soon as national and state elections came generally to be held upon the same day, there was a full establishment of the dominance of national politics

Powers of the States and Nation.—In powers within their own borders and in senatorial representation the states are equal.

The states under the federal system are units in the formation of a nation, not governments independent of a nation Before the Civil War a number of conflicts arose between national and state power, in which first one group of states and then another asserted its authority to proceed independently of the nation. Pennsylvania, Massachusetts, Virginia, South Carolina and other states in turn opposed the supremacy of national power under the constitution. The Civil War settled finally and conclusively that the states are merely units, although indispensable units, in the formation of a single national organization

The limitations imposed upon the states by the constitution of the United States clearly indicate the purpose to establish a single national organization with the states as units in that organization States are forbidden, without the consent of congress, "to keep troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent Danger as will not admit of delay." They are forbidden to enter into treaties, alliances or confederations. These types of limitations upon the states indicate a definite purpose to deprive the states of any independent existence as organizations in themselves, and this purpose is supported by the language making the "Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States" the supreme law of the land.

The power of congress to consent to an agreement or compact by one state with another state is important, particularly where states are close to each other. Such consent has authorized cooperation between states in the construction and use of bridges and tunnels, the apportionment of waters, harbour development, improvement of navigation, flood control, sanitation or abatement of pollution, conservation of fisheries, recreation, crime prevention and the regulation of oil production Political compacts, however, have not been undertaken between states.

The powers of the national government are such as are granted to it by the constitution of the United States. They must be found within the terms of that document It has no others. This basic principle was implied but not expressed in the constitution as first adopted. So important was its expression in the constitutional text regarded that the 10th amendment, adopted in 1791, provides that "powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." Yet, as late as 1941, the United States supreme court said that this amendment was but a truism. The states gave up certain powers in establishing the national government. They set out these powers in a written document and expressly reserved all other powers to themselves or to the people. The powers of the nation, found within the terms of this written document, are superior to the powers of the states.

Who is to determine, in case of doubt or conflict, whether such a superior power, asserted by the government of the United States, is within the terms of the constitution? Before the Civil War, states often asserted the authority to determine for themselves what powers belonged to the national government, but such assertions were unsuccessful. Since 1816 the legal principle has

been established that the line between national and state powers is to be drawn by the United States supreme court, an organ of the national government.

What are the powers granted to the nation? Express powers, couched in most cases in broad language, are conferred on congress, by a series of 18 paragraphs in article I, section 8, of the constitution. In even more general terms powers are conferred on the executive and judicial departments of the United States. In only one case is the power granted to the national government expressed as an exclusive power. Certain powers are of such a character that they must be exercised exclusively by the national government, as, for example, the levying of federal taxes, borrowing money on the credit of the United States, constituting federal tribunals inferior to the supreme court and the establishment of a uniform rule of naturalization. Others are made exclusively national by constitutional prohibitions upon the states The federal power to coin money is supplemented by forbidding states to coin money. The federal war powers are made exclusive by prohibitions upon the states. The federal treaty-making power is supplemented by forbidding state treaties and by inhibiting state compacts without the consent of congress. Other powers are of such a character that they may be exercised by either of two governments, but not by both The grant of such a power to the national government makes it exclusive.

Of necessity, many of the powers granted to congress are not exclusive In such matters, states may exercise power also, provided state action does not conflict with the superior powers of the national government in the same field Congress has complete power to regulate bankruptcies, but during a good part of the time since 1789 there has not been a federal bankruptcy law, and the matter has been left to the states. Congress has only in small part exercised its power to fix the standard of weights and measures, and there is valid state legislation upon this subject in all the states.

The constitution itself expressly provides for concurrent authority over the militia.

Under a general grant of power to regulate interstate commerce, congress has full power, but the states may legislate in regard to local needs and circumstances, unless congress otherwise directs.

Although all powers of the national government must be found within the terms of a written document, this by no means implies that all powers must be expressly granted by that document. The constitution of the United States grants a number of important powers in broad terms to congress and to the other departments of the national government. It further empowers congress "to make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof."

Throughout the earlier decades of government under this constitution, political and legal contests centred about the meaning of the words "necessary and proper," one party emphasizing the word "necessary" as narrowing the powers conferred and the other the word "proper" as broadening them. The rule of broad and liberal construction announced by Chief Justice John Marshall in 1819 has prevailed:

"Let the end be legitimate, let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, and which are not prohibited, but consistent with the letter and spirit of the Constitution, are constitutional."

Substantially all powers not national belong to the states, and such powers must be determined in large part by a process of subtraction Naturally no precise result can be obtained when the powers to be subtracted are based on broad implications and are not definitely determined The important national powers with respect to interstate commerce, taxation, treaties, post offices and post roads and maritime jurisdiction have been construed broadly, almost without exception.

The United States supreme court has long been engaged in determining the line between national and state power. This is a continuing duty. It is impossible to draw any definite or permanent line between national and state functions The steamboat and the railroad, the telephone and the telegraph, the aeroplane, the radio and television were potent factors in the development of national power. Railroad regulation began with the states but has tended to come almost completely under national control. Rapid progress in this direction has been made since the creation of the Interstate Commerce commission in 1887. The so-called antitrust movement began with the states, but restrictive commercial practices have largely come under national supervision with the Sherman Anti-Trust act of 1890 and the creation of the Federal Trade commission in 1914. Where a problem is national in character, its solution will by some means fall to the national government. The broad and flexible powers of that government are capable of further expansion as new needs develop with economic, social and engineering changes.

Along with the increase in national powers and in the activities of the national government has come also a similar increase in the functions performed by the state government. State governments today do more than ever before and cost more in proportion.

Powers of state governments are broad and comprehensive. Subject only to the condition that the government shall be republican in form, the states organize their own central and local governments and provide revenues for the support of these governments The state courts administer the great body of law affecting the rights of individuals and for the suppression of crime. Education, though aided by the national government, is under the control of the states and of the local governments created by them. The same statement applies to the construction and maintenance of highways and to the great mass of governmental details with which the citizen comes in daily contact. Indeed, except for the fact that the national government reoccupied the field of bankruptcy in 1898, the American is still in much the position described by James Bryce in the 19th century·

"The State, or local authority constituted by State statutes, registers his birth, appoints his guardian, pays for his schooling, gives him a share in the estate of his father deceased, licenses him when he enters a trade (if it be one needing a license), marries him, divorces him, entertains civil actions against him, declares him a bankrupt, hangs him for murder. The police that guard his house, the local boards which look after the poor, control highways, impose water rates, manage schools—all these derive their legal powers from his State alone."

But attention should be called to the fact that developments after 1933 greatly increased the importance of the national government, not only in the functions which it performs but also in its dominance over state governments. Unemployment compensation and old-age pensions are theoretically under state control, but in fact, federal control over state action is maintained through conditional federal subsidies and through a federal tax subject to 90% credit upon state compliance with federal requirements. Through a broad construction of federal power to regulate "commerce . . among the several States" there came a federal control over labour disputes and over hours and wages of labour where a substantial part of the articles dealt with has passed from one state to another or is to be marketed across state lines, or where the transaction is associated with the means of interstate traffic. Through the same power the national government came to determine the planting acreage of crops and the conditions and prices in the marketing of milk Through the enormous funds spent on relief the national government also established a substantially complete dominance over the states. The states remain, and will remain, as instruments of government; but the dominating control of the national government will also remain. The functions enumerated by James Bryce will remain state functions, but the states will be largely dominated in the performance of these functions The maintenance of state functions must, however, depend (1) upon the more efficient conduct of state governments and (2) upon the more effective co-operation with each other by the states as to problems which extend beyond the boundaries of a single state. Insurance was in 1944 held subject to control by congress as interstate commerce; but congress left control to the states, and the continuance of such state control is likely to

depend upon the efficiency and uniformity of state regulation.

Crime also came to be regarded as interstate, and thus more largely under federal control

Separate Administrative and Judicial Systems of Nation and States.—Throughout the territory of each state two governments operate—the nation with its administrative and judicial organizations for the enforcement of national law, and the state with its administrative and judicial organizations for the enforcement of state law. Federal revenues are collected through officers controlled from Washington; state revenues are collected by independent state and local officers Taxes levied by the two are in some cases similar in character. The nation and a number of states impose income taxes, but their administration is independent Violations of state law are tried and punished in state courts, violations of national law, in separate federal courts. However, a decision by the United States supreme court in 1945 makes violation of state law by a state officer punishable in federal courts where the disobedience of state law by the state officer is violative of due process of law under the 14th amendment. In some cases the laws of the two are directed to the same purpose, and are substantially identical. The constitutions of both forbid that a person be twice put in jeopardy for the same offense, but in legal theory the two governments are so distinct that one act, forbidden by substantially identical laws of each, may be punished by each as a separate offense

The reasons for this sharp distinction between the two governments are historical. The Articles of Confederation (1781–89) sought to act through the governments of the several states and not directly upon the citizens of the states. Government under these articles failed because each state finally determined for itself whether it would enforce the policies of congress. The national government, organized under the constitution of 1787, had it thought proper, might have sought to use the states as agencies for the enforcement of national law, as is largely done under the federal system of Switzerland But under the circumstances it was natural to build up an independent administrative and judicial system This system has steadily grown with the expansion of national activities

Taxation of Employees and Securities of One Government by the Other.—For many years it was the established principle in the United States that the exercise of independent powers by the nation and the state forbade either government to tax the employees or securities of the other. This principle, which was based on the theory that "the power to tax is the power to destroy," was later in large part replaced by the principle that each government may without discrimination tax the income of employees of the other; and the same principle may be applied to the taxation of securities issued by the national, state and local governments. However, the U.S. supreme court expressed the view that the national government may enter upon an enterprise personal in nature and forbid state taxation thereon, but that a similar state enterprise may be taxed by the national government.

2. WRITTEN CONSTITUTIONS

Under the federal system it is substantially necessary to have a written document defining the organization of the central government and determining the respective powers of the states and the central government. It was natural that articles of confederation should be framed for the creation of the first union of the American states, and that, when improvement was needed, these articles should be replaced by the national constitution of 1787.

There was no similar legal necessity that written constitutions be framed for the government of the American states. Yet the Colonies were accustomed to written instruments of government. Certain of them operated under royal charters. Massachusetts largely remained under its charter government until 1780, Connecticut until 1818 and Rhode Island until 1842. In other colonies the royal commissions to governors gave some written basis for government. Moreover, the leaders in the Colonies were familiar with and largely adherents of the theory that government is a result of social compact, and theories of natural rights were strong

It was therefore natural that, upon separation from England the several Colonies should embody in written form a declaration of their rights and the general organization of their governments. Before the framing of the national constitution in 1787, constitutions had been framed and adopted by all the original 13 states except Connecticut and Rhode Island. The framers of the national constitution therefore had before them the texts of state constitutions and were familiar with the experience under these constitutions. Each state is now governed by a written constitution.

3. JUDICIAL CONSTRUCTION OF WRITTEN CONSTITUTIONS

The constitution was regarded from an early date as law of a superior order and of a more permanent character than legislative acts Under the first state constitutions legislatures were the dominant organs of government. They abused their wide powers and helped develop a feeling that legislative authority should in some measure be curbed. In New Jersey in 1780 a statute was declared invalid as violative of the state constitution. Other decisions of this character gradually accumulated Apparently the framers of the federal constitution were in 1787 of the opinion that it would be the function of the federal courts to preserve the powers of state and nation under the federal constitution Such a power in the federal courts carries with it authority, in a case involving the issue, to declare either a federal or a state law invalid as violative of the constitution of the United States. Since Chief Justice Marshall's opinion in 1803, in *Marbury* v. *Madison*, the principle of judicial power to declare laws unconstitutional has been established in the federal system The authority of state courts to declare state laws invalid as violative of state constitutions is equally well established Except for a few provisions which are regarded as committed to the political organs of government, it may therefore be said that placing language in a written constitution makes such language judicially enforceable as against the legislative bodies. Whereas parliament is the supreme lawmaker under the English system of government, in the United States the written constitution as finally construed by the courts is supreme. Where constitutional provisions are clear and precise, this supremacy of the constitution as judicially construed makes little difficulty. But where language is used that is not capable of precise definition, as that of the 14th amendment that no state shall "deprive any person of life, liberty, or property without due process of law," the court may in fact determine not only the constitutionality but also the wisdom of legislative action.

The exercise of broad judicial power in such a manner as to control legislative policy has, however, largely ceased; the "due process of law" clause, the principle of the separation of powers and the broad language of the constitution with respect to federal powers are now construed not only in such a manner as to enlarge national authority but also in such a manner as to leave larger powers in the hands of the political departments of government—the president and the congress in the national system.

4. SEPARATION OF POWERS

National and state governments in the United States are each organized into three departments. The theory of separation of powers is formally announced in 40 state constitutions In the remaining eight state constitutions and in the constitution of the United States the same constitutional result arises from the fact that these nine documents create three departments of government and vest the legislative power in one, the executive power in another and the judicial power in a third.

There are no clear lines separating one governmental function from another, and the courts have therefore been unable to develop any logical lines of division Legislative power having been delegated to congress and the state legislatures, the courts frequently say that legislative power may not be delegated, but the very necessities of modern life have forced in the United States, as in England and on the continent, the vesting of a large amount of subordinate legislative authority in permanent administrative bodies within the executive department. In order to avoid terming this a delegation, the courts have come to designate such powers as "quasi-legislative," rather than "legislative." In the same manner, administrative bodies within the executive department have come

to exercise powers that are sustained on the ground that they are "quasi-judicial" rather than "judicial." The result is therefore not dissimilar from that in countries that have not attempted to set up three separate departments through judicially enforceable constitutions. But such flexibility as develops under the U S plan comes more slowly and can be achieved only with judicial approval. A study of U.S political institutions must, therefore, always take into account the greater rigidity in governmental structure resulting from the constitutional principle of separation of powers, although that rigidity has been to a large extent abandoned through less strict judicial construction.

5. PRESIDENTIAL SYSTEM OF EXECUTIVE ORGANIZATION

The federal government and the states of the United States have adopted the presidential system of executive organization, as distinguished from the cabinet or ministerial system found in England and most other countries. Under the presidential system there is an independent executive (president or governor) elected for a fixed term and holding office during that term irrespective of whether he is or is not in political harmony with both legislative bodies or either of them. The members of the legislative bodies are elected at fixed times and for fixed terms, and no power is vested in the executive to dissolve them or to force elections at any other times than those fixed. The principle of separation of powers as applied in the United States precludes any member of the executive department from having a seat in a legislative body Under this system the president or governor has real executive authority, and in all states but North Carolina has and exercises large power to control legislation by an executive veto. The presidential system presupposes that the executive and the legislature may at times not be in political harmony. And in fact this is the case in many of the states and in the national system. In the states of New York and New Jersey, for example, the governors have often been members of the Democratic party, while both houses of the state legislature have been controlled by the Republican party. The power ordinarily vested in the legislative bodies to impeach and remove the executive is judicial in character, and efforts have only occasionally been made to employ the power of impeachment to remove an executive politically hostile to the two houses of the legislature Such an effort was made, unsuccessfully, to remove Andrew Johnson from the presidency of the United States

The presidential system is more rigid than the ministerial plan of government, but it accords with the U.S doctrine of separation of powers When the country faces a crisis, as during the Civil War and the World Wars, popular sentiment maintains political harmony between the president and congress; and the executive tends to become the dominant factor in government The presidential system of the United States in fact met the serious problems of World Wars I and II with less difficulty than did the ministerial systems of England and France.

6. NATIONAL GOVERNMENT

National Constitution.—The constitution of the United States, framed in 1787 and adopted in 1789, is a brief and well-drafted document. Its influence has been felt, not only in the United States, but in the federal systems of Switzerland, Argentina, Brazil, Canada and Australia. The constitution outlines the organization of the three departments of the national government, defines the powers of that government and the relationship between the nation and the states. It provides a method of amendment and up to mid-20th century had been amended 22 times since its adoption. The first ten amendments, adopted in 1791, were the direct results of criticisms of the constitution at the time of its adoption and may almost be regarded as parts of the original document. Of the other amendments, the 11th, adopted in 1798, overcame a decision of the United States supreme court to the effect that a state might be sued by a citizen of another state. The 12th amendment, adopted in 1804, corrected a defect in the original constitution as to the method of choosing the president and vice-president. The 13th, 14th and 15th amendments were the immediate outcome of the Civil War. The 13th abolished slavery, the 15th forbade denial of the right to vote "on account of race, color, or previous condition of servitude." The 14th amendment, regarded for a while by the courts as limiting itself to the protection of the freed slaves, has become, by expansion of the terms "due process of law" and "equal protection of the laws," the means through which the United States supreme court determines the policy of state enactments in the field of social legislation The 16th amendment in 1913 gave congress an effective power to levy a federal income tax Popular election of United States senators under the 17th amendment, adopted in 1913, has somewhat reduced the importance of the state, as did the 18th (1919) transferring the liquor problem to the national government The 19th amendment (1920) nationalized women's suffrage The 20th amendment altered the time of beginning of terms of president, vice-president, senators and representatives; changed the time for sessions of congress, and provided for certain contingencies which may arise as the result of the death or failure to qualify of a president-elect. The 21st amendment repealed the 18th amendment and restored the control of intoxicating liquors to the states. The 22nd limited the presidential tenure of office to two elective terms. On the whole, the process of amendment, while to some extent enlarging federal powers, has been less influential in this direction than the decisions of the U S. supreme court.

Congress.—Legislative power in the national system is exercised by a congress composed of two houses The two houses have grown—the senate from 26 to 96 members, and the house of representatives from 65 to 435 members.

With respect to the house of representatives, article I, section 2 of the constitution provides that: "when vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies." With respect to the senate, the 17th amendment provides that: "when vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the people fill the vacancies by election as the Legislature may direct." Temporary appointments to the senate are infrequent.

United States senators are elected for six-year terms, and terms are so arranged that one-third of its members retire each two years. Since 1913 the elections in each state are by popular vote of the whole state, except that temporary appointments to fill vacancies are permitted. Members of the house of representatives are elected for two years, and the whole membership changes each two years. Each state is required to be divided into districts equal to the number of members it has in the house of representatives; but if the number of representatives apportioned to a state is increased, and the state legislature makes no reapportionment of districts within the state, then the additional representative or representatives are elected by the state at large; if the number of representatives apportioned to a state is decreased, and the state legislature makes no reapportionment of districts within the state, then all representatives are elected by the state at large. Each member of the house of representatives is required to be a resident of the state from which he is chosen; political and sectional interests make it practically impossible for a person to be elected for a district within the state in which he does not reside The result is that an able and experienced person ceases to be a member of congress if he fails of re-election by his district. In addition to the elected members, territorial delegates sit without vote in the house of representatives—one each from Alaska and Hawaii. One resident commissioner from Puerto Rico also has a seat in the house.

Beginning in Jan. 1947, the compensation of senators, representatives in congress, delegates from the territories and the resident commissioner from Puerto Rico is at the rate of $12,500 per annum each; from 1949 the compensation of the speaker of the house of representatives and the vice-president of the United States is at the rate of $30,000 per annum each, Whenever there is no vice-president, the president of the senate for the time being is entitled to the compensation provided by law for the vice-

president Starting also in Jan. 1947, each member of either house receives an additional $2,500 per annum as an expense allowance for which no accounting is made. Beginning at the same time the government contributes to an annuity which a retiring member of congress may receive after six years of service and attainment of the age of 62 years, or upon retirement for disability after five years of service

Prior to the adoption of the 20th amendment, on Feb 6, 1933, the president, vice-president, senators and members of the house of representatives assumed office on March 4 following their election; and the congress met annually on the first Monday of December. Under this plan newly elected members of the senate and house, elected in November of an even-numbered year, did not take office until March 4 of the succeeding year; and, unless the president called a special session of congress, the newly elected members did not actually begin to function until the regular session in the succeeding December, more than a year after their election. It was possible that the session meeting from Dec. 3 of the even-numbered year until March 4 of the odd-numbered year be controlled by members who had already failed of re-election, and who might therefore be regarded as no longer representing their constituents. In order to avoid control of a session of congress by defeated members, who were termed "lame ducks," the 20th amendment was adopted, under which the terms of the president and vice-president begin on Jan. 20 following their election; the terms of senators and representatives begin on Jan 3 following their election and congress assembles each year on Jan. 3. The regular sessions of congress usually adjourn in the early summer. The president may on extraordinary occasions convene the two houses in special session

The organization and procedure of the two houses of congress are to a limited extent determined by congress and to a larger extent by the size and traditions of the two houses. The rules of the senate permit great freedom of debate; those of the house of representatives restrict debate and expedite business. Under the senate rules obstructive tactics may be and are often resorted to, though such tactics relate in fact to relatively few measures. The house of representatives, with its larger membership, would be helpless with complete freedom of debate, yet both houses accomplish a large amount of legislative business.

The house of representatives elects from its own members a speaker as presiding officer. The vice-president of the United States is the presiding officer of the senate The work of both houses is largely done in committee The committee systems of both houses developed largely by accident; and many committees in each house, once created for important tasks, remained long after their usefulness had ceased The senate, in 1921, and the house of representatives, in 1927, reorganized their committees and materially reduced their number. But further increases immediately began, and multiplicity of committees, with conflicts of their jurisdiction in each house, led to confusion and interfered with joint action by committees of the two houses. With legislation enacted in 1946, 15 standing committees replaced 32 in the senate and 19 replaced 48 in the house. The act also specifically defined the authority of each committee, and encouraged co-operation between the two houses.

Committees in each house are controlled by the political party having a majority of the members of that house. Appointment to important committees is based largely on seniority in term of service, and a member serving continuously over a long period is likely to become chairman of an important committee, if his political party is in control. Seniority as such naturally plays a larger part in the house of representatives than in the senate with its smaller number of members, though the business of the senate is in good part controlled by a small group of experienced members. Leadership in the two houses is always exercised by a few members of the politically dominant party. In the house of representatives for many years before 1911, the real leadership was largely vested in the speaker, who made the appointments to standing committees. After 1911 the speaker was relegated more distinctly to the position of presiding officer, and committees were elected by the house itself on the basis of selections first made by the party organizations The majority and minority floor leaders have large influence. In the senate there is less individual leadership than in the house of representatives

Federal Executive.—In discussing the presidential system, the relation between the president and congress has been generally described. There were no constitutional limitations upon a president's succeeding himself, but a tradition long existed that a president should not serve for more than two terms, a tradition based on the example set by George Washington and other early presidents This tradition was broken by Franklin Delano Roosevelt, who was elected successively in 1932, 1936, 1940 and 1944, and who served from 1933 until his death on April 12, 1945. The 22nd constitutional amendment, proposed in 1947 and ratified by three-fourths of the states in 1951, provides that: "No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of the President more than once." This amendment was made specifically inapplicable to the person holding the office of president during the time of proposal and adoption of this amendment.

The constitution expressly authorizes the president to make certain appointments to office and the expansion of the national administration has greatly increased the number of officers owing their appointments to him. The more important appointments are subject to confirmation by the senate. The United States supreme court has determined that where power to appoint to an executive office is vested in the president, this carries with it a complete power to remove from office. Efforts upon the part of congress to impose restrictions upon the president's power to remove even his more direct advisers in 1868 led to the impeachment of Pres. Andrew Johnson, who escaped conviction by one vote. However, the president's power of removal may be limited by act of congress with respect to quasi-legislative or quasi-judicial officers, who are required to discharge their duties independently of executive control; and the use of such officers (particularly as members of independent commissions) has greatly increased with the extension of federal control with respect to commercial transactions of various types, including labour disputes and hours and wages of labour.

The president's control over the national executive administration is primarily exercised through the heads of ten executive departments, appointed by the president. These departments are department of state; department of the treasury; department of defense; department of justice, post office department; department of the interior; department of agriculture; department of commerce; department of labour, department of health, education and welfare. Department heads (the cabinet) are responsible to the president, and the extent to which he meets with them and seeks their advice rests entirely on his discretion In addition to these ten departments there are numerous boards and offices. The federal executive organization under the president is not systematically organized, and plans for its reorganization came under consideration early in the 20th century. During World War I and World War II the creation of new governmental agencies was necessary, and wide powers were conferred upon the president to redistribute the functions of governmental agencies. The need for reorganization in time of peace had become increasingly apparent with the expansion of activities of the national government Definite steps toward such reorganization were taken by an act of congress in 1933 which vested some power in the president for a two-year period and by an act approved April 3, 1939, which vested authority in the president to submit reorganization plans to congress before Jan. 21, 1941, the organization submitted by the president to take effect within 60 days after submission unless the two houses should disapprove by concurrent resolution. Substantial improvements were obtained under this act. Some readjustments were obtained under a similar act of 1945, which, however, did not give sufficient power to the president. A reorganization act of 1949 was based upon investigation by a commission headed by former Pres. Herbert Hoover. Under this act the presi-

dent might submit reorganization plans to take effect upon the expiration of the first period of 60 calendar days of continuous session of congress, unless rejected by one of the two houses of congress. Twenty-seven such plans were submitted to congress by May 31, 1950.

The great mass of the lesser employees are selected under a merit system, for whose conduct a civil service commission was first created in 1883 (*See* CIVIL SERVICE: *United States*) The finances of the national government were to a large extent systematized through the creation of a bureau of the budget in 1921 and through an improved committee organization effected in the house of representatives in 1927 for the consideration of national appropriations and expenditures.

The president's influence in the national government rests upon (1) powers granted him by the constitution and by federal statute; (2) political factors not found in constitutions or statutes; (3) the personality of the president

The president's position as head of a large executive organization, with wide powers of appointment and removal, in itself makes the position important. The authority to veto legislation, subject to being overridden by two-thirds of the two houses, gives him a power that may be employed with effect The authority to recommend measures to congress is only of such value as may be given to it by the position and influence of the president making the recommendation He is charged with the conduct of foreign relations, though here his authority is materially crippled by the requirement that two-thirds of the senators concur in treaties.

But the president's political position is equally as important as his constitutional power. He is in effect the chieftain of his party. He is also the outstanding figure in U.S. politics.

The possibilities of exercising power are great. The extent to which power is actually exercised depends upon the personality of the president and his capacity for political leadership The influence of the presidency varies with the man who occupies the office and with the circumstances that surround him, as in time of war.

Little need be said about the vice-president. His chief official duty is to preside over the senate, though he has substantially no influence in the deliberations of that body The machinery for nominating party candidates ordinarily chooses a vice-presidential candidate almost purely on the basis of political expediency and with little consideration of the fact that the vice-president may succeed to the presidency.

Yet within the first half of the 20th century three vice-presidents—Theodore Roosevelt, Calvin Coolidge and Harry S. Truman—succeeded to the presidency as a result of death, and thereafter were elected to the office In the case of death or disqualification of both president and vice-president, it was provided by the Presidential Succession act of 1947 that succession to the presidency be first to the speaker of the house of representatives; next to the president pro tempore of the senate; and successively to members of the cabinet who are heads of the departments listed several paragraphs above.

The president receives for his services the sum of $100,000 per year. The salary of the vice-president is $30,000 per year

Federal Judiciary.—The constitution of the United States provides for a supreme court and "such inferior courts as the Congress may from time to time ordain and establish." For the enforcement of federal law, congress has provided a complete judicial system paralleling that of the states. The judges of these courts are appointed by the president of the United States and hold their offices during good behaviour. They are removable only by the cumbersome machinery of impeachment.

At the head of the judicial system is the supreme court of nine judges, which sits at Washington. There are 11 judicial circuits of the United States, each with at least 3 judges, one being the District of Columbia with 9 judges, the 11 together having 65 circuit judges. To each circuit is assigned a justice of the United States supreme court, one of the justices being assigned to two circuits and the chief justice being assigned to both the District of Columbia and an additional circuit. The pressure of business in the United States supreme court, however, made it impossible for the judges of the supreme court to go on circuit. The district court is the court of original jurisdiction. In erecting districts for the organization of this court, state lines are regarded The smaller states constitute single districts, the larger are divided For the districts in which federal judicial business is especially heavy, more than one district judge is provided. For example, four districts with 26 judges exist in New York There are 93 districts with more than 200 judges, and the number of judges constantly increases. In addition to the general system of courts here outlined, there are a court of claims, court of customs and patent appeals, the tax court of the United States and federal courts for the District of Columbia and the territories.

With the two systems of courts—federal and state—exercising jurisdiction over the same territory, it is necessary that there be certain principles as to their relationship Such principles may be chiefly summarized as follows.

1. Upon questions of federal constitutional law, the United States supreme court is the final court of review. If the highest court of a state holds a federal statute or treaty to be invalid, or a state statute valid that is alleged to violate the federal constitution or federal statutes, the losing party has a right to a final decision by the highest federal court Where federal constitutional issues are otherwise involved in state courts, the United States supreme court may, in its discretion, review the state decision

2. Substantially all cases involving enforcement of criminal law of the federal government are tried in federal courts

3. With few exceptions, cases of admiralty and maritime jurisdiction and bankruptcy proceedings are tried in the federal courts

4. Under federal statutes, the federal courts alone have jurisdiction of suits against the United States, and of suits for the enforcement of federal revenue, immigration and other similar laws directly affecting the administration of the federal government.

5. In civil cases involving as much as $3,000, and (*a*) arising between citizens of different states or (*b*) arising under the constitution, laws or treaties of the United States, the parties have the choice of suing either in state or federal courts; but if the plaintiff sues in the state court, the defendant may transfer the case to the federal court

6. By statute it is provided "that the laws of the several States, except where the constitution, treaties or statutes of the United States otherwise require or provide, shall be regarded as rules of decision in trials at common law, in the courts of the United States, in cases where they apply." By recent decisions of the United States supreme court, the federal courts must apply not only state statutes but also the law as found in the decisions of the state courts. Until the adoption of uniform rules of civil procedure for United States district courts in 1937, the procedure in such courts in cases at common law was required to conform, as near as may be, with the procedure "in like causes in the courts of record of the State within which such district courts are held."

Through legislation of 1925 an effort has been made to reduce the number of cases that must be decided by the United States supreme court. That court has a limited original jurisdiction, the most important cases of such jurisdiction being cases to which a state is a party. Cases not infrequently arise in which one state sues another state. Aside from its original jurisdiction, cases come to the United States supreme court either from the highest state courts or from the lower federal courts. The decisions of the United States supreme court are of primary importance in the fields of constitutional and public law.

7. STATE GOVERNMENTS

The 48 state governments of the United States have certain common characteristics. Each state is legally the equal of every other state in the federal system. Each controls the organization of its own state and local governments. Each has a written constitution providing for three departments of government, with a legislature of two houses (with one exception) elected by popular

vote and a popularly elected governor as head of its executive department. Each state has a judicial system not essentially dissimilar in external organization from that of the other states Each state has created local governing areas for the performance of certain functions. The government of each state and of its important local areas is controlled through political parties organized on a national basis

Superficially, all the 48 state governments appear to be more or less alike and appear to be doing the same things The constant shifting of population has prevented the development of sharp differences in governmental organization Not only this, but from one state to another there has been a great deal of copying of political and legal institutions. However, each state is distinguished from its fellow states, not only in size and population, but also in location, climatic conditions and resources; and these differences reflect themselves in the political and governmental organization of the states

State Constitutions.—The constitutions in force in the 48 states vary a great deal in length and in content. Some were adopted in an earlier period, and some bear recent dates The constitution of Connecticut, adopted in 1818, together with subsequent amendments, requires only about 16 printed pages; the Louisiana constitution of 1921 requires 90 pages. The constitutions of Oklahoma, California and a number of other states are highly detailed Massachusetts still boasts that it is governed by the constitution of 1780; but this constitution has been altered in form by so many amendments that it would hardly be recognized by its original framers. By amendment or by the adoption of new constitutions, the states have steadily readjusted their institutions to meet changing needs The national constitution has proved a model for much of the development in the field of state constitutional history, particularly with reference to the establishment of three co-ordinate departments of government.

In most of the states the state constitutions organize three departments of government in some detail They contain elaborate declarations or bills of rights, and most of them contain provisions regarding the organization of local government Limitations upon the power of state legislatures have multiplied. Moreover, the framers of constitutions are inclined to include in these documents regulations of any matters of great public interest at the time. The state constitution has in this way come to contain many matters of temporary detail, and such detail requires frequent amendment.

The state constitutions provide for methods of change. The methods employed are three: (1) constitutional conventions; (2) legislative proposal of amendments; (3) proposal by popular initiative petition. All but 12 of the state constitutions expressly provide for constitutional conventions; in all of these 12 it is recognized as proper to employ conventions for constitutional change Ordinarily conventions assemble as a result of popular vote and submit their recommendations for popular approval

Proposals of constitutional amendment may be made by the legislatures in 47 states. In New Hampshire changes may be made only by constitutional convention Methods of amendment through legislative proposal vary in the 47 states, but in all except Delaware, a legislative proposal of amendment must be submitted to and approved by popular vote before it becomes effective Details of the amending process vary. In some states, as California, Louisiana, New York, the adoption of amendments through legislative proposal is easy; in others, as Illinois and Minnesota, the constitution is substantially impossible to amend, although an effort at greater ease was made by Illinois.

The proposal of constitutional amendments through popular initiative petition, followed by popular vote, is a fairly recent development; but this plan has now been adopted by 13 states. In these states also, there is a varying ease or difficulty in employing the plan of amendment. In Oregon and four other states it is as easy to amend the constitution through initiative petition and popular vote as it is to enact a statute through the same devices In each state that had adopted the plan of popular initiative, this plan has merely been added to the two already existing devices of constitutional conventions and proposal by legislative action. By the three methods of change more than 1,500 amendments were proposed in the 48 states between 1900–20, of which about three out of five were adopted.

State Legislature.—In all of the states except Nebraska, legislative power is exercised by a body composed of two houses. Constitutional amendments for the organization of a legislative body composed of but one house were proposed in Oregon in 1912 and 1914, in Oklahoma in 1914 and in Arizona in 1916. All of these proposed amendments failed, but the plan of a unicameral legislature was adopted by Nebraska in 1934. Since Vermont abandoned the unicameral system in 1836, the Nebraska legislature of 1937 was the first to be so organized. It is composed of a single chamber of 43 members elected on a nonpartisan basis In all other states, the smaller of the two houses is called the senate. All but eight of the states call their larger house a house of representatives; but the eight have such varying titles as assembly, general assembly and house of delegates Nearly half of the states use the term legislature to designate the two houses together; but so use the term general assembly and 3 use the term legislative assembly. Massachusetts still uses the term general court, which was first employed in the colonial charter, and New Hampshire uses the same term In view of the fact that the legislative bodies have somewhat varying names in the several states, it has been customary to refer to the larger of the two houses as the lower house and to the smaller as the upper house.

To a large extent the exact number of members of the two houses, or of one of the two houses, is left to legislative determination, subject to constitutional restrictions The size of the two houses varies a good deal from one state to another. The Minnesota senate is the largest, with 67 members, and that of Delaware the smallest, with 17. The size of the lower house ranges from 35 in Delaware to 443 in New Hampshire. The membership of the lower houses is especially large in several of the New England states because of the system of town representation, but in these states the senate is relatively small

In a majority of states, senators are elected for four years and representatives for two years. In some states, one-half of the members of the senate are elected every two years, so that the senate has continuous membership, as contrasted with the house, whose membership is chosen as a whole at each election. In Alabama, Louisiana, Maryland and Mississippi, however, four-year terms have been provided for members of both houses; and a number of states have a two-year term for members of both houses

In some states financial measures must originate in the lower house; and in most of the states the senate has certain powers with respect to confirmation of executive appointments. The provisions for impeachment of public officers also ordinarily prescribe that charges shall be brought by the lower house and tried by the senate. But on the whole it may be said that, from the standpoint of legislation, the two houses of state legislature have equal powers and do not represent different points of view in the community. Distinct differences that existed in many states in earlier times have substantially ceased to exist, although in a number of states differences in territorial representation have grown up.

In the earlier state governments the substantially equal representation of local areas was not grossly unfair, because of the absence of great inequalities in their population. To a large extent, the idea of geographical representation survives in a number of states The lower houses of Connecticut, New Hampshire and Vermont, and both houses of Rhode Island, are based upon town representation, and with the growth of large urban communities this basis has become highly unequal. In 1920 New Haven, with 162,000 inhabitants, had two representatives in the lower house of the Connecticut legislature, but so also did the town of Union, with 257 inhabitants. Such inequality is not confined to New England

The present representative system is the result of two conflicting forces In most of the states some attention is paid to local governmental areas. It is common for constitutional provisions to forbid the crossing of county boundaries in the establishment of

representative areas. On the other hand, the principle of equal representation upon the basis of population has steadily developed. The more common plan today is to provide for the periodical reapportionment of membership in the two houses upon the basis of population. Delaware, however, permits a reapportionment only by constitutional change, and other states, while providing for periodical reapportionment, limit the basis of representation in such a manner as to preserve an inequality. In California, New York and some other states representation in one house is based on population and in the other in large part upon the counties as units, in an effort to balance urban and rural interests and to prevent domination of the legislature by a single large community.

Members of the state legislature are chosen from local districts by popular vote. Proportional representation has been proposed, but has not been adopted for the choice of members of state legislatures, although in municipal elections it has come to some use. All states adopt the plan under which a candidate is elected who receives a plurality of the votes in his district; though Illinois since 1870 has provided for three members of the lower house in each electoral district, and that each voter may vote for three or cumulate his votes for one or two candidates

Under the first state constitutions provision was generally made for the annual election of members of legislative bodies and for annual legislative sessions. Frequent elections of the legislature were deemed essential safeguards of popular rights and were at this time thought sufficient safeguards. Most state legislative bodies now meet in January of odd years, and constitutions ordinarily prescribe the number of days for which the session may continue. Biennial sessions are held in even years in Kentucky, Louisiana, Mississippi and Virginia. Annual sessions are held in Massachusetts, New Jersey, New York, Rhode Island and South Carolina. Massachusetts adopted the plan of biennial sessions in 1918 and returned to annual sessions in 1944. Alabama and Mississippi experimented for a time with quadrennial sessions.

As is the case with congress, the work of state legislatures is largely done through committees. There is little of an effective legislative program or of organized leadership in the two houses A number of states have in recent years sought to devise a more definite legislative policy through the creation of legislative councils, composed of representatives of the two houses, each council to remain continuously in existence and to consider important matters of legislation with the aid of a permanent body of experts An efficient and influential governor occasionally exercises a distinct leadership in important matters of constructive legislation, but over legislative enactments in general his influence is negative rather than affirmative.

He now has a veto power over legislation in all of the states except North Carolina; and the veto can, in most of the states, be overcome only by a two-thirds vote, although only a three-fifths vote is required in some states, and a bare majority in others. There has also been a definite increase of the governor's control over appropriations, through the vesting in him of a power to veto items in appropriation bills Such a power now exists in all but 10 of the states There has been a tendency in some states to extend the governor's veto power still further. The Washington and South Carolina constitutions confer upon the governor the power to veto any item or section of a bill presented to him, and a similar power exists in Alabama. In addition, several states have recently given the governor wide powers with respect to the state budget

The veto power is not an idle weapon in the governor's hands Its use and effectiveness depend upon several factors—the extent of the governor's constitutional power, the personality of the governor and the political agreement or disagreement at the time between the governor and the two houses. Of about 1,600 measures passed in 1923, for example, by the legislatures of 44 states, more than 1,100 were disapproved in their entirety, and more than 1,000 parts of bills were disapproved. Of the bills disapproved, 104 were repassed by legislatures; and of the parts vetoed, only 40 were repassed.

State Executive.—In the first state constitutions the executive department was subordinate to the legislature In most states, the governor and certain other state officers were chosen by the legislature; and an executive council, also chosen by the legislature, was substantially placed on guard to prevent executive usurpation. Such an attitude toward the governor was natural in 1776; but the governor's power almost immediately began to grow. New York in 1777 made its governor popularly elective, though it at the same time created a council—the council of revision and the council of appointments—to share with the governor the powers of veto and of appointment to office. Massachusetts (1780) and New Hampshire (1784) followed with the plan of popular election Executive councils now remain in Massachusetts, Maine and New Hampshire.

In all states the governor became a popularly elected officer and hence independent of legislative dominance. Other state officers became popularly elective, though some such officers are still chosen by state legislatures Until late in the 19th century the functions of state government were few and were chiefly conducted by a small group of popularly elected officers As new needs have developed, the constitution itself has provided for new offices, which have usually been filled by popular election Illinois has six such officers in addition to the governor; Idaho and Nebraska, seven each. Chief among the state executive offices, independent of the governor in most states, are lieutenant governor; secretary of state; superintendent of public instruction, attorney general, treasurer; and auditor, or comptroller

By creating a group of state officers, all popularly elected in the same manner, state constitutions in fact create a plural executive, although the theory of state government presupposes a single head of the executive department But only to a slight extent are constitutional powers directly conferred upon the lieutenant governor, secretary of state and other popularly elected state officers The governor has thus had the opportunity to become the chief state executive in fact as well as in constitutional theory The increase in the governor's executive power has come about primarily through the creation of new offices by statute and the vesting in the governor of power to appoint to such offices. In this manner, as new state functions were assumed, numerous offices were created, without reference to any efficient supervision by the governor Some states had as many as 200 independent officers, most if not all of whom were appointed by the governor, but over whom it was physically impossible for the governor to exercise an effective supervision. A recent movement in the states has sought to organize executive functions into a small group of departments, each under a director appointed by and responsible to the governor. One of the chief difficulties in building up an effective state executive system is that the governors of half the states are elected for terms of only two years. In the other states the term is four years. There has, however, been an increase in state executive powers and leadership, but any possibility of leadership is greatly handicapped by the fact that the majorities of one or both of the two houses of the state legislature may often be politically opposed to the governor This lack of political harmony is more common in the states than in the national government

Unfortunately, most state governments are operated for the political advantage of the party or persons in control. In order to avoid such political conditions, the state of Georgia, under the leadership of its governor, adopted a new constitution in 1945, placing control of education and of other important state functions in the hands of boards appointed by the governor for terms of such length that no one governor would control the membership of the board.

State Judiciary.—Generally the states have courts of three types:

1. Justices of the peace, having a limited and inferior jurisdiction in both civil and criminal cases. Justices of the peace are ordinarily elected from towns or townships or from districts created for the purpose within the county The jurisdiction of justices of the peace is strictly limited by statute, and their courts are not courts of record Appeals are allowed from their action to the court of general trial jurisdiction and ordinarily the trial in the higher court is a trial *de novo* The system of justices of the peace paid on a fee basis has not proved satisfactory and has been replaced in the larger communities. Virginia and Missouri have taken steps which may lead altogether to the abandonment of the system To some extent a major defect in the system has been met by placing the justice of the peace on a salaried basis

2. In all states there are courts of general trial jurisdiction, known as superior courts, district courts, circuit courts and in some states by still a different name. The court of general trial jurisdiction has ordinarily a general authority to try all cases in law and equity. Five states still retain the old English plan of separate courts for the trial of cases at law and in equity, but most of the states have abolished the distinction between law and equity. In some states, as in Arizona, California and Ohio, the court of general trial jurisdiction is organized upon a county basis, and there is a separate court for each county The more common plan, however, is to have the court of general trial jurisdiction go on circuit from one county to another, at least in the smaller counties of the state

3. Each state has a court of review, the function of which is chiefly that of hearing appeals from the courts of general trial jurisdiction This court is ordinarily termed the supreme court But in Kentucky, Maryland and New York it is called the court of appeals; and slightly different names are used in several other states. The highest court is usually given some original jurisdiction, but ordinarily this original jurisdiction is small, and its use is strictly limited by the court itself, in order that time may be available to hear appeals from other courts.

As these three features are outlined, state judicial organization becomes to a large extent a matter of diversities In many larger communities a municipal court has been organized, which not only replaces justices of the peace, but is granted a much more extended jurisdiction than that ever been conferred upon justices of the peace. In a number of states there is also a so-called county court, with some jurisdiction, both civil and criminal, and also usually a fairly large authority with respect to rather distinctly administrative matters, such as those relating to county affairs, elections and charities. Where county courts exist independently of the court of general trial jurisdiction, they are often vested with authority in probate matters as well.

There are also other types of trial courts with special jurisdiction. Every large community now has a juvenile court, and separate probate courts are not uncommon Other specialized courts, such as domestic relations courts, morals courts, boys' courts, speeders' courts and small

claims court have been established in many larger communities, often as branches of a municipal court In some cases there are separately organized criminal courts, although ordinarily criminal jurisdiction is exercised by the courts of general trial jurisdiction. In all of the states the prosecution of *criminal offenses* is by and in the name of the state and is conducted by prosecuting attorneys, who are usually elected by the voters of the county

The state judicial organization has placed great emphasis upon appeals from lower to higher courts No case of any importance is regarded as settled until it has been taken to the highest court Increased complexity of appellate court organization has been forced by the growing number of appeals to be heard The increased mass of appellate work has been handled in three ways: (1) by increasing the number of judges of state supreme courts; (2) by authorizing these courts to sit in sections; and (3) by creating intermediate appellate courts, standing midway between the trial courts of general jurisdiction and the highest court

There are now three methods of selecting judges in the United States. (1) In 38 states, with the exceptions hereafter noted in California and Missouri, judges of the highest court are elected by the people; in all of these states except one the trial judges are chosen in the same manner, (2) in four states the judges are elected by the legislature, and in one they are appointed by the legislature upon the nomination of the governor; (3) in five states the highest judges are appointed by the governor, subject to confirmation by the governor's council in Maine, Massachusetts and New Hampshire, and to confirmation by the *senate* in Delaware and New Jersey. Certain inferior judges in other states are also appointed by the governor

A new plan adopted by California in 1934 removes that state from any one of the classes indicated above The California plan, which applies to justices of the supreme court and of the district courts of appeal, provides that upon the expiration of the term of office of any such judge, such judge may file a declaration of candidacy to succeed himself If he does not do so, the governor nominates a suitable person, subject to confirmation by a commission composed of the chief justice of the supreme court, the attorney general of the state and a justice of one of the district courts of appeal The name of the candidate to succeed himself, or of the candidate nominated by the governor and confirmed by the commission, is then placed upon the ballot at the next general election and the electors vote upon the question as to whether he shall be elected. If a majority vote "yes" he is elected to or continued in office Under this plan a candidate has no opposing candidate, but an election determines whether he shall become or remain a judge By popular vote in any county the same plan may be adopted for the superior court judges of that county.

In 1940 Missouri adopted a plan similar in certain respects to that of California with respect to judges of the supreme court, the courts of appeal and the circuit and probate courts in the city of St. Louis and Jackson county.

8. LOCAL GOVERNMENT IN THE STATES

What is ordinarily referred to as the "state government" is the central organization located at the state capital But this central organization does much the smaller part of the work of the state Unlike the national government, which establishes its central organization for

[illegible]

ration of small communities as villages, with a simpler form of government than that provided or permitted for cities

[illegible]

(1) small boards of commissioners elected at large by the county; (2) large boards elected by townships and cities within the counties. But in a number of states, counties are divided into districts for the election of a small county board In each county will be found a clerk (or *clerks*) of court and a sheriff. Each county provides a courthouse and a jail Locally elected county judges and county treasurers will ordinarily be found and a prosecuting officer elected by the voters of the county. In many states the county is a unit of school administration, and there is a county superintendent of schools, usually elected by the voters of the county A movement is now actively under way toward a more centralized executive organization in the county

The terms town and township are usually employed to designate areas of local government into which the county is divided, though in New England the town is the most important unit of local government New England towns have areas of from 20 to 30 sq.mi, and usually include both rural territory and more compact village settlements. About three-fourths of them have less than 2,500 inhabitants each, and hence may properly be classed as rural communities. The large communities usually become incorporated as cities, and generally the creation of city government terminates the existence of town government within the city's limits The town meeting is the chief organ of government in the New England towns.

So-called town or township systems of government are found in the great central group of states extending from New York to Nebraska. The forms of township government in these states may be classified as follows (1) those which, as in New York, have the town meeting and township representation on the county board; (2) those, as in Minnesota, which have the town meeting but no township representation on the county board, and (3) those, as in Pennsylvania, which have merely a local township organization, but no representation on the county board and no town meeting.

Efforts have been made to introduce the township system in the states of the south and of the west, but in these states the counties are ordinarily divided into subordinate districts, largely for administrative purposes; and such districts, though sometimes called townships, usually have little, if anything, of independent authority in the field of local government.

The growth of urban population has naturally led to the development of cities as the chief agencies to meet local needs occasioned by more compact population. The chief forms of city government in the United States are primarily three. (1) the mayor-council, or federal, plan, (2) the commission plan; and (3) the manager plan.

The mayor-council, or federal, plan is still the most general. It is to a large extent organized upon the analogy of the national government. There is a popularly elected mayor with large powers, which have tended steadily to develop The mayor normally has a veto power and a fairly large power of appointment, although several of the more important officers, such as clerk and treasurer, are usually elected by the voters of the city, just as is the mayor. There are ordinarily under the mayor a group of departments whose heads are appointed either by the mayor alone or by the mayor with the approval of the council. Usually there is a council composed of a single house, whose members are elected from wards into which the city is divided, although occasionally some or all of the members are elected from the city at large.

The fundamental characteristic of the commission plan of city government is an elective commission, usually of three or five members, having large municipal powers, both legislative and executive. Each of the commissioners is the head of a department, and there are as many main city departments as there are commissioners. Along with this system have come ordinarily the initiative and the referendum in municipal ordinances and a power to recall the members of the commission by petition and popular vote

The so-called manager type of city government had its origin about 1908, though it first received serious consideration upon its adoption by the city of Dayton, O., in 1913 Nearly 1,000 cities in the U.S. are now governed under the manager plan Under this plan there is a commission or council, whose members are usually elected from the city at large, oftentimes by the use of proportional representation This body determines the policy of city government and selects a manager to administer the affairs of the city. Through the commission plan, which originated in 1901 and which for perhaps 15 years had great sway in U.S. city development, and through the manager plan, which originated in 1912 and has tended to replace the commission plan, much has been done since 1901 toward the reconstruction of city government in the U S

9. ELECTIONS AND POLITICAL PARTIES

The state government has the primary responsibility for the conduct of elections, national, state and local State constitutions and state laws set up machinery for the conduct of elections, and determine the qualifications for voting, subject to the federal restrictions against discriminations because of race, colour, previous condition of servitude or sex.

Through a succession of changes, the states have now come to have substantially universal suffrage for males and females above the age of 21 years. Georgia in 1944 reduced the voting age to 18. Suffrage for women became national in 1920 through the adoption of the 19th amendment to the constitution of the United States. Educational

qualifications for voting have been imposed in some states, as in New York; and qualifications as to education or tax-paying have been imposed in a number of southern states, which discourage voting by Negroes. State laws require registration of voters in the larger communities to identify those qualified to vote

Few officers are chosen by popular vote in the federal system—the president, vice-president, members of the two houses of congress and presidential electors are so chosen. A much larger group of state officers are chosen by popular vote and an even larger number of county, city and other local officers When all of these types of offices are united on one ballot in one election, the voter is at times faced with the problem of choosing 100 or more officials from among several times that number of candidates Moreover the so-called initiative and referendum have been adopted in 18 states; constitutional amendments are proposed for popular approval by state legislatures and under many state laws, proposals of municipal bond issues and other local questions must be submitted for popular approval The voter is somewhat at a loss when forced to express himself upon perhaps 30 technical proposals and upon a large number of candidates for public office. His choice upon the measures submitted to him is largely haphazard, except upon the occasional measure of real importance. His choice among candidates for national, state and local offices is primarily guided by political parties.

Practically throughout its history, the United States has been a country of two parties A third party has occasionally been important, as was the case with the Progressive party under the leadership of Theodore Roosevelt in 1912 In the early years of the nation, the Federalist party represented the interests of a stronger nationalism; the Republican party under Thomas Jefferson, the interests of the states In the period of Andrew Jackson, the name of the then dominant party changed from Republican to Democratic; and, the Federalists having disappeared, the Whigs became the other great party The Whigs were replaced by the Republicans, who elected Abraham Lincoln to the presidency in 1860. During all of this period lesser parties have existed and have occasionally cast a vote sufficient to determine which of the two major parties should control

Political parties originated as voluntary organizations But they soon came to control the election to their state and national offices; for in the election no one except a candidate of one of the two leading parties had or has the possibility of being elected. The methods of the political party thus became of importance to the government itself Today political parties are in reality no longer voluntary organizations but are rather organs of the government itself, controlled in great detail by state legislation. One of the first respects in which political parties came under official control was the printing of the ballot Before 1888 parties printed their own ballots and naturally determined also the conditions under which the names of their party candidates should appear upon such ballots. Serious abuses arose under this arrangement, particularly with respect to the secrecy of the ballot Beginning in 1888, the states adopted the official, or so-called Australian, ballot Under the official ballot plan, ballots are printed at governmental expense This expense is usually borne not directly by state government but by the local bodies charged by the state with the conduct of elections In practice the printing of ballots, state laws at the same time necessarily determine the conditions under which party organizations shall be entitled to have the names of their candidates appear upon such ballots

But with the adoption of the so-called Australian ballot political parties still had, and have, sufficient power to determine the form of that ballot. Massachusetts and a few other states have adopted a plan under which the names of the candidates are grouped under the titles of the offices; though under the Massachusetts plan the party to which each candidate belongs follows the name of the candidate This arrangement of the ballot makes it necessary for the voter to mark separately on his ballot the name of each candidate for whom he desires to vote Most of the states, however, have adopted the so-called "party-column" ballot. The party-column ballot varies in different states, but its fundamental idea is that all of the candidates for one party shall appear in a single column so that a voter may vote for all of them by placing one mark upon the ballot. If the voter does not wish to vote the party ticket, he is put to the burden of marking each of the candidates for whom he wishes to vote, or at least each candidate not belonging to his own party.

The methods of party nomination next came under state control Serious abuses in the party convention system for the nomination of candidates and the framing of party platforms led to legislation regulating the convention; but such regulation did not appear sufficient. The primary election system (see PRIMARIES) has now been established in some form in all but two of the states, although recently there has been a strong political movement against primary elections and some gain for the older convention system Where the primary system has been adopted, conventions normally remain, with more limited functions.

Control by law over the official ballot and over the methods of party nomination has naturally been followed by a detailed regulation of the machinery of party organization. Through primary elections, the party voters in most of the states choose their party committeemen. State laws determine the power of such party committeemen and also determine the manner in which they shall form the various party governing bodies State laws also determine how party organizations shall frame platforms Governmental regulation of political parties has largely been occasioned by a feeling that party organizations themselves control the government and that they should, rather, be controlled by the government But governmental regulation has not weakened political parties

When it is first created, a party usually stands for some political principle as opposed to other parties Ordinarily, however, parties are merely convenient devices for the operation of government and for presenting political issues to the voters when such issues arise Political issues are not created merely by the existence of two opposing parties, and during much of the time no real issues exist upon the basis of which parties may oppose each other At such times parties proclaim principles, but have no sharp differences When issues are altogether absent, parties still perform the functions of narrowing the choice of the voter and of uniting candidates into groups for final elections

The political expert (who is termed "boss" if sufficiently successful) has the tasks of keeping the party organization together, getting party members to the polls and rewarding political service He can perhaps be more successful if he holds no office, because by holding office he divides his energies and subjects himself to personal criticism for possible errors of political conduct Each political group has its precinct and ward committeemen, who are normally on the public pay roll (local, state or national); if their group is in power, and whose continuance on that pay roll depends upon their efficiency, not as public employees, but in controlling the vote of the precinct or ward The spoils of office and the grosser forms of political corruption are the bases of political organization; corruption secures contracts upon those who practice it. But these are contracts to be let, without too great an insistence on standards, and other similar opportunities for enormous profit Furthermore, important business and professional interests in a community usually co-operate with the organization in return for special favours

With party organization a vast and complex mechanism, nomination and election to office almost of necessity come, in most cases, as a reward for service in the party organization No man of ambition who lacks the support of a party organization has much opportunity either to be nominated or elected, though an independent candidate may occasionally win, in case of great popular upheaval Even under such conditions, the independent candidate who wins must almost necessarily have financial resources sufficient to set up a rival organization of his own. Many states have enacted statutes limiting expenditures of candidates in party primaries and in elections, but such laws have not been effectively enforced While they operate in favour of the candidate sponsored by the political organization Those who come to office usually do so only after a long apprenticeship in party service

The recognition that national parties should not control in the election of local and judicial officers has led to a movement for nonpartisan elections In a number of states judicial officers are nominated and elected through ballots required to contain no party designations. But a candidate must actually be sponsored by a political organization if he is to fare well in any election The nonpartisan election has accomplished more in municipal than in state elections

Parties are organized on the basis of national issues. Few such issues are important in state government and fewer still in local government But the party organization, though national in scope, supports itself largely through the offices and other profits derivable from state and local government In spite of the movement for nonpartisan elections, it is still possible to apply to the U S party system the statement made by James Bryce in the 11th edition of the *Encyclopædia Britannica*:

"The national parties have been so pervasive in their influence, and the working of their machinery has formed so important a part of the political history of the United States, that it is necessary here to call attention to the high significance of this element in the system of the Republic. The party system has made nearly all elections, including those for state offices and city offices, the functions of which have, as a rule, nothing whatever to do with national party issues, matters of party strife fought upon party lines It has disposed voters in state and city elections to support party candidates, of whom they might otherwise have disapproved, for the sake of maintaining in full strength for national purposes the local party organization, and it has thereby become a fruitful source of municipal misgovernment. It has thrown great power into the hands of party managers, because where the strife between the two great parties is keen and the result of a contest doubtful, discipline and obedience are deemed needful for success. It has tended to efface state lines, and to diminish the interest in state issues, and has thus helped to make the nation overshadow the states."

The democratic movement in the United States places upon the voter the duty of electing numerous officers of whose qualifications he cannot have knowledge and of expressing an opinion upon numerous measures of whose merit he cannot be informed The most intelligent citizen, devoting all of his time to public affairs, would in a large number of cases, of necessity, cast an unintelligent ballot. But the functions so imposed upon the voter must be exercised, and the political party has been devised for their exercise. So long as the voter is asked to vote too much, party organization rather than political principles will dominate U S. policies, except in the occasional case where the issue as to a candidate or a principle becomes sufficiently

important to foice the party organization into the background.

X. HISTORY

BEGINNINGS OF SELF-GOVERNMENT, 1578-1783

The American nation owes its origin to colonizing activities in which the British, Dutch, Swedes, French and Spaniards bore a share, and which were continued during a period of more than two centuries at the beginning of the modern era. The settlements of the Dutch and Swedes (New Netherland and New Sweden) were soon merged in those of the British, and of the territory colonized by Frenchmen and Spaniards the United States, as it was in 1783, included only certain outlying regions. All the European nations which were interested in colonization shared in the enterprise, and the population of the region was therefore cosmopolitan from the outset; but the British, especially after 1660, secured a controlling influence.

Permanent settlements on the Atlantic seaboard were first made in the early years of the 17th century, and they continued steadily to increase until after 1680 Relatively speaking, that was the period of settlement, but population continued slowly to advance westward In the 18th century occurred a large immigration of Germans and Scottish-Irish, who settled in Pennsylvania and New York and thence overflowed into the western parts of Virginia and the Carolinas. The only Colony founded in the 18th century was Georgia (1732), by means of which British outposts on the Florida frontier were strengthened.

General Aspects of Colonization.—British colonization originated chiefly in private initiative, though it acted in half-conscious obedience to certain general principles. To this fact is due the trend toward self-government, which was fundamental and controlling in the history of the British on the American continent. But to an extent the tendencies which favoured self-government were counteracted by the influence of the British Crown and parliament. The influence of the Crown was continuous, except during the period of the Civil War and Commonwealth (1642–60), while that of parliament was not felt until the middle of the 17th century, and its colonial legislation subsequent to that time was chiefly confined to matters of trade The activities of Crown and parliament were directed toward the securing of imperial interests and of that degree of subordination and conformity which, in States that have developed from Roman and feudal origins, attaches to the condition of colonies or dependencies. The term "imperial control" therefore suggests the second tendency in colonial affairs, to the discussion of which the historian must address himself.

Among the colonists the trend toward local independence and self-government was in harmony with the spirit of the English. Neither was it lacking among the other nationalities represented in the Colonies But in the case of the British it was greatly strengthened by the fact that the Colonies were founded by private initiative, the government legalizing the efforts of the "adventurers" and planters, but leaving them in many cases almost wholly to themselves. Hence many small Colonies and settlements were founded. A variety of motives—economic, religious and political—contributed to the founding of these Colonies, and naturally people correspondingly different in type came to inhabit them The remoteness of the Colonies from Europe and the difficulties under which communication with them was maintained confirmed and perpetuated the tendency toward independence Somewhat similar conditions controlled intercolonial relations, kept the colonists apart from one another and checked co-operation Thus it was that the causes which confirmed the colonists in the spirit of independence toward the mother country also made them jealous of external authority

Chartered Colonies.—The term "chartered Colonies" is the one which best describes the forms under which the British-American settlements were founded and under which they all continued for varying periods. They were the direct and characteristic results of private initiative. The discoverers and would-be colonizers, acting individually or in groups, collected the ships, men and resources necessary for their enterprises, and procured from the Crown a charter By this document the King conveyed to them a claim to the soil which would be valid in English law, gave them the right to transfer Englishmen thither, to trade with them and with the natives, and to govern the Colony, subject to the conditions of allegiance and of British sovereignty in general. The rights and liberties of the colonists as British subjects, without attempt to define what they were, were guaranteed by the charters, and the grantee was prohibited from passing laws or issuing orders which were repugnant to those of England In only a part of the charters—those chiefly which were issued subsequent to 1660—was express reference made to the calling of assemblies. So general were the provisions of the charters that they only remotely determined the forms which government should assume and what the rights of the colonists should be A considerable variety of institutions and social types existed under them. But their very indefiniteness made them valuable as objects of appeal to those who in time of controversy were upholding local rights and liberties

London and Plymouth Colonies.—Of the chartered Colonies there were two varieties—proprietary provinces and corporate Colonies. Though alike in the fact that the patentees who founded them were mesne tenants of the Crown, they were quite unlike in their internal organization and to a considerable extent also in the character of the people who inhabited them The proprietary province was a development from the principle of the fief, though with many variations. The early charters of discovery, those for example which were granted to John and Sebastian Cabot and to Sir Humphrey Gilbert, contemplated the founding of feudal principalities in the New World The grant to Sir Walter Raleigh, which resulted in the abortive colonial experiment at Roanoke, was of the same character. At the period of transition from the rule of the Tudors to that of the Stuarts, trading companies and companies for colonization were increasing in number and importance. The joint companies which were chartered by James I in 1606, one to have its residence at London and the other at Plymouth, were of this character They were granted the right to colonize, the one in northern and the other in southern "Virginia"; the intervening territory, three degrees in breadth, being left common to the two. The rights of the companies were confined to settlement and trade The Plymouth patentees achieved no permanent result; but those of London founded Jamestown (1607) and other settlements along the James river, which later became the province of Virginia.

But before this result had been reached the London patentees had secured in succession two new charters, one in 1609 and another in 1612. By means of these grants they had practically separated from the Plymouth company, had secured a concession of territory 400 mi. broad and extending through the con-

tinent, and had been able to perfect the organization of their company. By the grant of 1606 the right to govern the Colonies had been reserved to councils of royal appointees, but by their later charters the London patentees were fully incorporated, and in connection therewith received not only the power to grant land but rights of government as well This made the Virginia Company of London the proprietor of the province which it was founding. It now appointed resident governors, councillors and other officials and instructed and controlled them in all ways, subject of course to the general supervision of the King in council. Under the charter of 1606, in order to facilitate colonization on a strange continent, joint management of land and trade was temporarily instituted But under the fully organized company this system was abandoned, and private property in land and the control of trade through private "magazines" were established A number of distinct plantations and settlements were founded. From these localities, in 1619, under authority from the company, representatives were elected who met with the governor and council at Jamestown and formed the first colonial assembly held on American soil. Its acts were duly submitted to the company in London for its approval or disapproval Other assemblies were called, the tobacco industry was established and the principles upon which traffic in that staple was to be conducted with Europe were announced. Thus Virginia assumed the form of a proprietary province, with an English trading company as its proprietor

New England Council.—Meantime west of England men had been making fishing voyages and voyages of discovery to northern "Virginia," which now was coming to be known as New England. In 1620 a new charter was procured, the reorganized company being known, in brief, as the New England Council Like the London patentees, this body was now fully incorporated and received a grant of the vast territory between 40° and 48° N. lat. and extending through to the South Sea (Pacific) Full rights of government, as well as of trade and settlement, were also bestowed. The moving spirit in this revived enterprise was Sir Ferdinando Gorges (*q.v.*), an Anglican and royalist from the west of England. For a time John Mason (*q.v.*) was his most active coadjutor. Such backing as the company received came from nobles and courtiers, and it had the sympathy of the court. But lack of resources and of active interest on the part of most of the patentees, together with the development of a Puritan interest in New England, led to the failure of this enterprise. No Colony was established directly by the council itself, but that part of its vast territory which lay adjacent to the coast was parcelled out among the patentees and by them a few weak and struggling settlements were founded They were all proprietary in character. But, as events proved, Plymouth Colony (founded in 1620), which was Puritan and Separatist to the core, became a patentee of the New England council; and the Colony of Massachusetts Bay (founded 1628–30), which was to become the citadel of Puritanism in America, procured the original title to its soil from the same source. At the outset both Massachusetts and Plymouth must be classed as proprietary settlements, though far different from such in spirit and destiny. Massachusetts soon (in 1629) secured a royal charter for its territory between the Merrimac and Charles rivers, and thus took a long step towards independence of the council. At the same time the Plymouth settlers were throwing aside the system of joint management of land which, as in the case of Virginia, had been imposed upon them by adventurers who had lent money for the enterprise; were paying their debts to these same adventurers; and were establishing a system of self-government similar to that of Massachusetts Thus a strong Puritan interest grew up in the midst of the domain granted to the New England council, and in connection therewith the type of colony to which we have given the name corporate came into existence.

Corporate Colonies.—In order to understand the nature of the corporate colony, it is necessary to explain the internal organization of that type of company which, like the Virginia Company of London, was founded for purposes of trade and colonization. It was composed of stockholders, who became members as the result of the purchase of shares or of migration to the Colony as planters, or of both acts combined. In the Virginia company they were known as the "generality," in the Massachusetts and other companies as the "freemen" In them, when met as a democratically organized body under the name of "quarter court" or "general court," was vested the governing power of the company It elected the officers, chief among whom were a treasurer or governor, and a council or board of assistants These, as well as the subordinate officers, held annual terms only. Membership in such companies might be indefinitely increased through the issue and sale of shares They were, in other words, open companies, whereas the New England council was a closed body, its membership being limited to 40.

Massachusetts.—In 1629 the prospects of Protestantism at large, and of Puritanism in England, were so dark that the founders of the Massachusetts company, who were decidedly Puritan in spirit and inclined to nonconformity in practice, resolved to remove with their charter and the governing body of their company into New England. Preparatory to this, John Winthrop was elected governor and a settlement was made of their business relations in England After the removal had been made, the assistants and general court met in New England and business was carried on there exclusively by planters. An order was soon passed that none should vote or hold office who were not members of some one of the churches within the Colony. As all these churches were Independent or Congregationalist in form and doctrine, this order gave a wholly new definiton to the term "freemen." It made of this colony something approximating to a biblical commonwealth, and subordinated trade, landholding and settlement to the interests of the Puritan faith As local settlements about Massachusetts Bay were founded, the general court, which before had been a primary assembly—simply the freemen of the company—came to consist partly of representatives elected by the freemen of the towns. In this way a second chamber—that of the deputies—was added to the assistants to form the general court of the Colony. Taxes were levied by this body, and laws and orders proceeded from it which related to all functions of government. It elected or appointed the governor and other chief officials.

Of primary importance in the affairs of the Colony was everything which concerned religious belief and church government. The churches and their relation to the civil power presented the great questions upon which hinged its policy. This was true not only in its internal affairs, but in its relations with other Colonies and with the mother country. An ecclesiastical system was developed in which Independent and Presbyterian elements were combined. By a rigid system of tests this was upheld against Antinomians, Baptists, Quakers and dissenters of all sorts.

Connecticut and Rhode Island.—As a consequence of the Puritan migration from England and of the expulsion of dissenters from Massachusetts, Plymouth and Connecticut, the New Haven Colony, and the towns about Narragansett Bay which became the Colony of Rhode Island were settled. These all were corporate Colonies, organized upon fundamentally the same plan as Massachusetts. Their settlers at the outset had no charters, but by means of plantation or town covenants assumed powers of government, which ultimately were vested in general courts similar to that of Massachusetts. Rhode Island was formed by a union of towns, but elsewhere the Colony was coeval with or antedated the town. Connecticut and Rhode Island, in 1662 and in 1663 respectively, secured royal charters by which they were incorporated within New England itself and the governments which they had established there were legalized. New Haven was absorbed by Connecticut in 1664 under the charter of 1662 and Plymouth remained without a charter from the King until, toward the close of the 17th century, it became a part of the enlarged province of Massachusetts.

The most prominent feature of the New England land system was the "town grant," which in every case became the territorial basis of a group settlement. Throughout New England, and in the outlying districts which were colonized by New Englanders, settlement was effected by groups. The process began in Ply-

mouth and was extended through the entire section. The Puritan migration from Europe was of the same general character. Groups of people, animated by a common religious or political ideal, broke away from their original or temporary abiding-places and pushed farther into the wilderness, where tracts of land were granted to them by the general court.

Over the founding of towns the general courts, as a rule, exercised a watchful supervision. Not only did the courts fix and maintain their bounds, but they issued regulations for the granting of lands, for common fields, fences, herds, the punishment of trespass, the admission of inhabitants and freeholders, and the like But subject to these general regulations, the allotment and management of its land was left to each town. The Colonies had no land system apart from the town. It was partly in order to manage their lands that the towns were made centres of local government and town meetings or boards of town proprietors were established. By means of town action, taken in town meetings and by local officials, the land of each settlement was laid off as house lots, common and common fields, meadow and pasture. Detailed regulations were made for the management of common fields and for their ultimate division and allotment among their proprietors. The same was true of fences and herds. The result was an organization similar to the English manor, but with the lord of the manor left out. To this peculiarity in the form of New England settlement is due the prominence of the town, as compared with the county. The town was the unit for purposes of taxation and militia service as well as of elections It was also an important ecclesiastical centre.

As a result of the process thus sketched, southern New England was settled by a population of English origin, with similar instincts and a form of political organization which was common to them all. Gorges, meantime, had secured (1639) a royal charter for his province of Maine, but Mason had died before he obtained such a guaranty for his settlements on the Piscataqua river. The small communities along that entire coast remained weak and divided. In 1635 the New England council surrendered its charter. The helplessness of the Gorges family was insured by its adherence to the royalist cause in the English Civil War. Massachusetts availed itself of a forced interpretation of the language of its charter respecting its northern boundary to extend its control over all the settlements as far N.E. as the Kennebec river This was accomplished soon after 1650, and for the time Anglican and royalist interests throughout New England seemed hopelessly wrecked. New England had thus developed into a clearly defined section under Puritan domination. This fact was also clearly indicated by the organization, in 1643, of the New England Confederacy, or the United Colonies of New England (*see* NEW ENGLAND).

Middle and Southern Colonies.—The Colonies of the middle and southern sections of the territory which later became the United States were wholly proprietary in form. This was true of New Netherland (founded by the Dutch West India Company in 1621) and of New Sweden (settled under the authority of the Swedish Royal Company in 1638), as well as of the English Colonies. In the case of Virginia and of the Dutch and Swedish settlements, trading companies were the proprietors. But the later English Colonies, beginning with Maryland in 1632, and continuing with the Carolinas (1663), New York (1664), New Jersey (1665), Pennsylvania and the Lower Counties, afterwards Delaware (1681), were founded by individual proprietors or proprietary boards. Georgia (1732), the only English Colony settled after 1681 on the continent, existed for 20 years under a proprietary board of trustees. By the efforts of adventurers of this class, put forth chiefly during the period of the Restoration, the entire coast-line from Florida to Acadia was permanently occupied by the English. But, unlike New England, the population was of a mixed character, as were the economic and religious systems, and to an extent also the political institutions.

As has already been stated, in their internal structure and in the course of their history the proprietary provinces differed very materially from the corporate Colonies. Those of later English origin also differed in some important respects from Virginia under the company and from New Netherland and New Sweden. The system of joint management of land and trade, which was so characteristic of early Virginia, was outgrown before the other proprietary provinces were founded. Neither did it prevail in the Dutch and Swedish provinces.

In the proprietary province the proprietor, or board of proprietors, was the grantee of powers, while in the corporate Colony it was the body of the freemen organized as an assembly or general court. He might exercise his powers in person, or, as was usually the case, delegate them to one or more appointees In any case, the form of government of the proprietary province was essentially monarchical in character. The powers that were bestowed were fundamentally the same as those which were enjoyed during the middle ages by the counts palatine of Chester and Durham. The normally developed provinces which resulted were miniature kingdoms, and their proprietors petty kings. This character arose from the fact that the grantee of power was the executive of the province. This branch of government was thereby brought into the forefront At the beginning and for a long time thereafter it continued to bear the leading part in affairs. It was not so in the corporate Colony, for there the freemen and the general court stood at the centre of the system In most of the corporate Colonies the executive was strong, but that was due to the political and social influence which its officials had gained, and not to their tenure of office.

Proprietary Colonies.—In every case, apart from the ordinary rights of trade and the guarantees of the liberties of the colonists, the powers which were bestowed on the proprietors were territorial and governmental. The territory of the provinces was granted under the conditions which by English law controlled private estates of land. An entire province, or any part of it, could be leased, sold or otherwise disposed of like a private estate It was an estate of inheritance, descending to heirs. The attitude of proprietors toward it was that of landlords, investors or speculators in land. They advertised for settlers, and, in doing so, an ever present motive with them was the desire to secure more private income from land In 1664 the duke of York sold New Jersey to Berkeley and Carteret, and the sale was effected by deeds of lease and release. In 1708 William Penn mortgaged Pennsylvania, and under his will devising the province legal complications arose which necessitated a suit in chancery.

In all the later proprietary charters, except that of New York, the operation of the statute *Quia emptores* was suspended, so far as relations between the proprietor and his immediate grantees were concerned By virtue of this provision each proprietor, or board, became the centre from which originated an indefinite number of grants. These were held directly of the proprietor and through him of the Crown. In practice the same was true also of New York. The proprietors were thus left free to make grants on such conditions as they chose. Preparatory to the exercise of this power, the proprietors issued so-called "concessions" or "conditions of plantation," stating the terms on which they would grant lands to colonists. Under a system of head rights, analogous to that which existed in Virginia, land was thus bestowed on settlers upon easy terms. Proportional amounts of land were granted upon the importation of servants, and in this way a traffic in servants and their head rights to land was encouraged among planters and masters of merchant vessels. In all the provinces, except New Netherland, a quit-rent was imposed on all grants. In the Dutch province rents were sometimes imposed, but they varied in character and differed from the English quit-rent. In Maryland fines were levied on alienations. In Maryland and Pennsylvania the demand for land became so great that it was sold.

In all the provinces territorial affairs were administered directly by the provincial authorities, and not by towns as in New England. In Maryland a land office was fully organized, towns developed only to a very limited extent, and when they did originate they were in no sense village communities Lots in them were granted by provincial authorities and they were subject to a quit-rent. They were simply more densely populated parts of the counties, and, unless incorporated as boroughs, had no distinct

institutional life In almost all cases land, in the provinces, was granted to individuals, and individual ownership, with direct relations between the owners or tenants and the proprietary authorities, was the rule.

Had governmental powers not accompanied the territorial grants, these grants would have been estates of land, unusually large, no doubt, but nothing more In cases where the governmental rights of proprietors were suspended or resigned into the hands of the Crown, they remained thereafter only private landlords. But the rights of government bestowed with the land made the territory a province and the proprietor its political head

The provincial charters made the proprietors of the proprietary provinces the executives of their provinces and for the most part left it to them to determine how and under what forms the governmental powers which they had received should be exercised. The powers which were definitely bestowed were executive and judicial in character, giving to the proprietor an importance, especially at the outset, which was comparable with that enjoyed by the general courts in the corporate Colonies It made him in a derived and inferior sense the source of office and honour, the fountain of justice, the commander of the militia, the recipient of the provincial revenue, the constituent part of the legislature. But in most cases the proprietors did not attempt to exercise these powers in person By means of commissioners they appointed a group of leading officials for their provinces, as a governor, councillors, a secretary, surveyor general, receiver general or treasurer, and somewhat later an attorney general These all held office at the pleasure of the proprietor.

The Governor.—The governor was *par excellence* the agent for the proprietor for all purposes of administration. In making appointments the proprietor was usually guided by the governor's recommendations. In some cases he was a relative of the proprietor; family influence in Maryland after the Restoration came to dominate the government of the province In all his important acts the governor was required to take the advice of his council, and that body was expected to co-operate closely with him, but the governor was not bound to follow their advice. The relations between the two were the same as that between the King and his privy council in England. As settlements multiplied and counties and other local subdivisions were formed, other and inferior offices were created, the right of appointment to which rested with the governor By means of an executive, thus organized, land was granted and the revenue from it collected, counties and other local divisions were established, early preparations were made for defence, courts were opened and the administration of justice begun.

In the later proprietary charters generally, with the exception of that issued to the duke of York, provision was made for assemblies. It was made, however, in very general terms, and it was left to the option of the proprietors to determine when, where and how they would call them. These legislatures did not originate in the natural or pre-existent rights of Englishmen, nor did the existence of a parliament in England make them necessary, though it greatly increased the difficulties of governing the Colonies without them. These legislatures were immediately proven to be indispensable and their activity in the provinces gradually opened the way for the growth of modern democratic institutions

The Legislature.—When met in regular form, the provincial legislature consisted of the governor, the council or upper house, and the assembly or deputies. These deputies, who were elected by the localities, constituted the only representative part of the legislature. In tenure and functions the governor and council were largely independent both of the deputies and of the electors. They were a part of the executive and were naturally swayed by a regard for the interests of the proprietor and by administrative traditions. In many cases the importance of the councils was increased by the fact that, with the governor, in early times they formed the highest judicial tribunal in the province. As the governor had the sole power of calling, proroguing and dissolving the general assembly, the council might advise him in such a way as to destroy the body itself or thwart its plans. The joint work of the council and assembly was subject to the veto of the proprietor, or of both the proprietor and his governor. The legislature of the province, therefore, differed materially from the general court, though in practice this was somewhat offset by the fact that in the New England Colonies the magistrates were usually re-elected for a long series of terms.

In the province, as in the kingdom, the legislature was in a sense an expansion of the executive, developed out of it, and was to an extent controlled by it Out of this relation arose the possibility of conflict between the two parts of the legislature—that which represented the people and that which represented the proprietor In the history of the provinces this formed the central line of cleavage. From the first the assemblies largely controlled taxation Using this as a lever, they endeavoured to limit and define the powers of the executive and to extend the sphere of legislation more widely. Fees, from which officials derived most of their support, were a favourite object of their regulation Occasionally offices which had originally been appointive were made elective. Protests of various kinds were made against official cliques Now and again the lower house came to a deadlock with council or governor. Threatened or actual revolt was sometimes necessary to bring the executive to terms. By such tactics as these the popular elements in the constitutions of the provinces asserted themselves The sphere of ordinance was gradually limited and that of statute extended.

Constitutions.—In a number of provinces—the Carolinas, New Jersey and Pennsylvania—the proprietors at various times initiated elaborate constitutions, in which not only a land system, but forms and functions of government were prescribed on a large scale. These were variously known as fundamental constitutions, concessions and agreements, and frames of government, and in every case were submitted to the general assembly for its acceptance or rejection Long struggles often ensued over the question of acceptance, which usually ended in the modification or rejection of the schemes.

Course of Development.—The history of these provinces was not uniform In New Netherland and New York occurred a struggle for the establishment of a legislature, which continued at intervals for 40 years and was not permanently successful until after New York had become a royal province. The proprietors of New Jersey never secured a royal charter, and therefore were not able to establish satisfactorily their claim to rights of government. Within the vast reaches of the Carolina grant developed two provinces. One of these—North Carolina—was almost entirely neglected by the proprietors, and the weakened executive repeatedly succumbed to popular violence. In South Carolina many violent controversies occurred, especially over the efforts of the proprietors to compel the acceptance of the Fundamental Constitutions, which originated with Locke and Shaftesbury. But in the end this failed, and a simple form of government, such as was adapted to the needs of the province, was developed. In Pennsylvania the liberal policy of the proprietor led at the beginning to unusual concessions in favour of the colonists, one of the most characteristic of these being the grant of an elective council The total neglect of provision for defence by the Quaker province led to the suspension of Penn's powers of government for about two years after the English Revolution and the outbreak of the war with France This did away with the elective council for the time, and an appointive council was soon substituted. Finally, in 1701, the council was deprived of its powers of legislation and thereafter the legislature of Pennsylvania consisted of only one house—the assembly

Imperial Control, 1606–1760.—Imperial control over the Colonies, it is to be noted, proceeded chiefly from the English Crown. It was exercised through the secretary of State, the privy council and a succession of boards subordinate to it which were known as commissioners of plantations or the board of trade; by the Treasury and Admiralty boards and their subordinate bureaux; by the attorney general and the solicitor general and by the bishop of London. The more continuous and intimate supervision proceeded from the privy council and the commissioners subordinate to it, and from the Treasury board,

which caused the auditing of such revenue as came from the Colonies, supervised expenditures for them and had an oversight over appointments in the colonial service. The privy council received letters and petitions on almost every kind of colonial business, caused hearings and inquiries to be held, and issued letters, instructions and orders in council on an equally great variety of matters It also acted as the regular court of appeal for the plantations. As time advanced, more of the administrative business passed directly into the office of one of the secretaries of State and the privy council became less active. The Admiralty was concerned with the equipment of the navy for service in the Colonies, and the high court of admiralty with the trial of prize cases and of cases arising from violations of the acts o trade. The bishop of London had supervision over the appointment and conduct of clergymen of the English Church in the colonies and over parish schools there.

Parliamentary Control.—The parliament by mentioning the dominions in its statutes could extend their provisions to the colonies The early acts of supremacy and uniformity contained such reference, but it was dropped after the Restoration and no serious attempt was ever made to enforce uniformity in the Colonies. Parliament did not begin to legislate seriously for the colonies until after the Restoration Then the acts of trade and navigation were passed, to which additions were made in the reign of William III. and from time to time during the 18th century This body of legislation comprised the most important acts relating to the Colonies which were passed by Parliament. A few statutes relating to military affairs were passed about the middle of the 18th century About 100 statutes in all were passed prior to 1760. The colonists themselves imitated in a general way the organization and procedure of the English courts. The main features of the common law came spontaneously into force in the Colonies. The legislatures of several of the Colonies adopted large parts of the statute law of England. The colonists were always accustomed to avail themselves, as far as possible, of the great English statutes which guaranteed liberty. After about 1690 the obligation was very generally enforced upon the Colonies of sending the acts of their assemblies to England for acceptance or rejection by the King in council.

But this, though far-reaching, was only one of the objects which were sought through the exercise of imperial control. Its chief object was to maintain the rights of Great Britain over the Colonies and her interests in them in all respects. The diplomacy of Great Britain concerned itself to an increasing extent, as the 18th century advanced, with the acquisition or losses of colonial territory, with the fixing of boundaries and with the securing of commercial interests. The interests of trade, more than any other subject, determined the colonial policy of England The church and her interests also demanded attention. In all these matters the English executive—the Crown—continuously, and for the most part exclusively, managed colonial affairs. During the Commonwealth in the 17th century, parliament was the source of all activity, whether legislative or executive, but at other times its legislation was confined chiefly to the subject of trade.

Isolation of the Colonies.—A natural condition which affected colonial administration as a whole and to a large extent determined its limits and character was the remoteness of the Colonies from England. At best three months were required for sending a dispatch from London to America and procuring a return. This explains the large degree of self-government which the Colonies possessed and the indifference with which their affairs were usually viewed, even by British officials. Only a relatively small part of colonial business came before English officials or received their serious attention. Only at long intervals and in summary fashion was it brought to the attention of Parliament. It is believed that the affairs of the continental Colonies were never seriously debated in Parliament until after the beginning of the controversy which led to the American War of Independence. Social and political intercourse with the colonists and governmental control over them were therefore very imperfectly developed. In fact, the control over them was almost wholly executive, and during most of the period it was to a degree unintelligent and weak; in fact it was something more resembling a federation.

Chartered Colonies.—The central fact in colonial history during the 17th century was the development of the chartered Colonies At their founding, as we have seen, the Crown delegated rights of settlement and subordinate rights of government to proprietors, who used them in a variety of ways The effect of this was to introduce a number of mesne lords between the king and his colonial subjects, a phenomenon which centuries before had vanished from England itself The patentees governed the colonists, and the Crown interfered only at intervals to adjust matters. Under the first two Stuarts some rather desultory efforts were made to check the development of such a system in the early stages After a controversy over a contract for the sole importation of tobacco, which became involved with the political struggles of the time in England, the charter of the Virginia Company of London was revoked (1624). A royal commission was appointed to readjust the affairs of Virginia and to inaugurate its government as a royal province. In 1634 a board of commissioners of plantations was created and it received very large powers over the Colonies. The year following the New England council resigned its charter, a writ of *quo warranto* was issued against the Massachusetts charter, and a plan was nearly perfected for sending out Sir Ferdinando Gorges as royal governor, or rather governor general, to New England. But means were lacking, the suit against the Massachusetts patent failed to accomplish its purpose, and troubles at home soon absorbed the attention of the Government.

During the Great Rebellion in England New England was left practically to itself. Strife broke out in Maryland, over which the home Government was scarcely able to exercise even a moderating influence. The Dutch from New Netherland and Europe were able to monopolize a large part of the carrying trade in tobacco and European goods. Virginia assumed an attitude of distrust or hostility toward the new Government in England. In 1651 and 1652 Parliament sent out a commission, with an armed force, which adjusted affairs in Virginia by suspending Government under Sir William Berkeley, the royalist governor, and leaving control in the hands of the assembly By a stretch of power the commissioners also took control of affairs in Maryland, but there they intensified rather than allayed the strife. Baltimore, however, managed to save his interests from total wreck, and at the Restoration was able to re-establish his authority.

Navigation Acts.—During this time of unstable government in England the seeds were planted of a colonial policy which was henceforth to dominate imperial relations. It was then that England entered upon the period of commercial rivalries and wars. The Cromwellian Government determined to wrest the control of the carrying trade from the Dutch, and the Navigation Act of 1651 and the first Dutch War were the result. Gen. Robert Sedgwick was sent against New Netherland, but ended in attacking Acadia. At this time also the national hatred of Spain, which had so characterized the age of Elizabeth, reasserted itself and the Spanish seas were invaded. In connection with these events plans were formed for a more systematic colonial administration, which Cromwell did not live to execute, but which were taken up by Clarendon, the duke of York, the earl of Shaftesbury and a large group of officials, lawyers and merchants who surrounded them. They took definite shape after the Restoration in the creation of a council for trade and a council for foreign plantations, in the passage of the acts of trade, in the conquest of New Netherland, in the settlement of the Carolinas, and in a resolute attempt to adjust disputes in New England. These events and their consequences give greater importance to the next three or four decades than to any later period until the colonial revolt.

The council for foreign plantations was continued, sometimes under a patent and sometimes as a committee of the privy council, until in 1696 it was commissioned as the board of trade. As a board of inquiry and report, subordinate to the privy council, the most important business relating to the Colonies was transacted before it. The acts of trade, in which the principles of the system were laid down, were passed in 1660, 1663, 1673 and 1696. They expanded and systematized the principles of mercantilism as they had long been accepted. The import and export trade of the

Colonies was required to be carried on in English and colonial built ships, manned and commanded by Englishmen. The policy of the staple was applied to the trade of the Colonies by the enumeration of their chief products which could not be raised in England and the requirement that such of these as were exported should be brought to England and pay duties there, and that the supplies not needed for the English market should be sent thence to foreign countries. The same policy was applied to all colonial imports by the requirement that they should pass through English ports. In order to prevent intercolonial traffic in enumerated commodities, which might lead to smuggling, the act of 1673 provided for the levy of an export duty on them in the Colonies in cases where a bond was not given to land them in the realm.

In the 18th century severe restrictive measures were passed to prevent the growth of manufactures in the Colonies; but these acts proved mostly a dead letter, because the Colonies had not reached the stage where such industries could be developed on any scale. Certain compensations favourable to the Colonies also appear in the system, *e.g.*, the measures to suppress the raising of tobacco in England and Ireland, in order that the colonists might have the monopoly; the payment of bounties on the importation of naval stores and on the production of indigo by the colonists; the allowance, on the re-exportation of colonial products, of drawbacks of part or all of the duties paid on importation; the admission of colonial imports at lower rates of duty than were charged on the same products from foreign countries In order to ensure the enforcement of these acts elaborate provisions became necessary for the issue of bonds, and this, with the collection of a duty in the Colonies, led to the appointment of colonial customs officers who were immediately responsible to the commissioners of the customs and the Treasury Board in England. With them the governors were ordered to co-operate Courts of vice admiralty, with authority to try cases without a jury, were established in the Colonies; and just before the close of the 17th century they were given jurisdiction over violations of the acts of trade, a power which they did not have in England. It thus appears that the resolve to enforce the policy set forth in the acts of trade resulted in a noteworthy extension of imperial control. How far it was successful in the immediate objects sought it is impossible to say. In some of the Colonies and at some times the acts were practically nullified. Illegal trading was always carried on, especially in time of war. But in the large it is probable that the acts were effective, and their existence always furnished a standard to which officials were required to conform.

By the Act of Union of 1707 Scotland was admitted to the advantages of the English trade system. In 1733, in order to check the development of the French colonies and prevent the importation of their products into English possessions, the Molasses Act was passed. This provided for high specific duties on rum, molasses and sugar, when imported from foreign colonies into those of Great Britain. So high were these rates that they could not be collected, and little attempt was made to enforce the act.

Returning to the 17th century, the conquest of New Netherland by the British in 1664 was an event of great importance. Taken in connection with the settlement of the Carolinas, it completed the hold which the English had upon the North American coast and gave them for the first time an extent of territory which could be profitably developed. The occupation of New Netherland was effected by a royal commission, which was also empowered to hear complaints and report a plan for the settlement of disputes in New England. A little more than ten years later a similar body, accompanied by a military force, was sent to Virginia to adjust matters at the close of Bacon's rebellion. But the commission of 1664 was the most noteworthy example of its kind. Yet, though it succeeded at New Amsterdam and in the southern Colonies of New England, it failed at Boston. Massachusetts would not admit its right to hear appeals. It did not succeed in wresting from Massachusetts the territory of New Hampshire and Maine, which the heirs of Gorges and Mason claimed

Dominion of New England.—In 1676 Edward Randolph was sent as a special agent to Massachusetts, to require it to send agents to England. He returned to England the sworn enemy of that Colony and continued to be its tireless prosecutor. A series of negotiations ensued which lasted for almost a decade, and ended in the revocation of the Massachusetts charter by a decree in chancery, 1684 New Hampshire had already been organized as a royal province. Government under the charters of Rhode Island and Connecticut was soon after suspended. All New England was then organized as a dominion or viceroyalty under Sir Edmund Andros Assemblies were everywhere abolished and government was left wholly in the hands of the executive. New York—also without an assembly—and New Jersey were soon after incorporated with the Dominion of New England, its boundary being extended to the Delaware river After Bacon's rebellion in 1676 the lines of executive control were strengthened in Virginia, but the assembly continued active These rapid changes involved the downfall of the former system of chartered colonies and the substitution of royal provinces in their place The effect of this was to introduce into the Colonies a large number of officials of royal appointment The entire executive and judiciary in a royal province was appointed directly or indirectly by the king. Its members held under commissions subject to the king's pleasure and were controlled by his instructions

Colonial Reorganization.—By the abolition of assemblies and the union of Colonies on a large scale James II did violence to the strongest feelings and traditions of the colonists The New Englanders not only viewed the levy of taxes by prerogative with the utmost aversion, but they feared a general unsettlement of land titles, the destruction of much that was valuable in their system of town government, and the introduction of Anglican worship They shared also in the fear, which was widespread among the colonists, that the Crown intended by an alliance with the French and Indians to force Roman Catholicism upon them. Therefore the fall of the Stuart Government in England was the signal for an uprising at Boston (April 1689) followed by a less successful one at New York. The Dominion of New England at once collapsed and the old Colony Governments were generally restored. A revolt against the Catholic proprietor in Maryland resulted in the suspension of his powers of government and the organization of Maryland as a royal province. William III granted a new charter to Massachusetts (1691) in which full provision was made for an assembly, but also for a governor and secretary of royal appointment. Rhode Island and Connecticut were allowed to remain under their corporate charters. New York and New Hampshire were organized as royal provinces with assemblies. Proprietary government struggled back into existence in New Jersey. In Pennsylvania the governmental powers of the proprietor were suspended from 1692–94, because of his neglect of provision for defence; then they were restored and Pennsylvania continued under proprietary government until the War of Independence.

The transition from the system of chartered colonies to that of royal provinces was thus well advanced towards completion. But it was a gradual process, and the later stages of it were not reached until the second decade of the 18th century South Carolina became provisionally a royal province in 1719, and a parallel change was completed in North Carolina a decade later. Georgia received a royal government in 1752. But in 1715 Maryland was permitted to resume its proprietary form. After the Revolution of 1689 the change to royal governments did not involve in any case the abolition of colonial assemblies. Henceforward the Crown had a fully equipped executive in every royal province The governors exercised the royal rights of calling, proroguing and dissolving the assemblies; they assisted in initiating legislation and exercised the right of veto. All bills passed by the assemblies were required to be submitted to the King in council for acceptance or disallowance. The upper houses of the legislature were the councils of the provinces. These were small bodies and consisted, in every case except Massachusetts, of royal appointees. Their support was in most cases given to the governors, and by that means they were greatly assisted in resisting the encroachments of the lower houses of assembly which were elected by the freeholders But, as a rule, the Crown made no provision for the salaries of its governors and other officials, and left them largely dependent for support on appropriations by the assem-

plies. Under this system of balanced forces, analogous in general to that which was reached after the Revolution in England, the Colonies entered upon the long period of the French wars.

Struggle with the French, 1690–1760.—Early French discoveries and colonization in North America were confined chiefly to the valley and gulf of the St. Lawrence. These led in the early seventeenth century to the establishment of the province of Canada. By 1670 the French had possessed themselves of the valley of the lower St Lawrence, and the relations with the Indian tribes were being determined During the next 50 years Canada grew slowly into an autocratically governed province, in which the Roman Catholic church was so strong as to contest supremacy at times with the civil power. The fur trade became from the first a most important industry The Jesuits and other priestly orders undertook missionary work on a large scale among the natives. The fur trader and the missionary soon extended French influence through the region of the Great Lakes. Between the Iroquois and the French, wars were almost continuous, but with the other Indian tribes the French were in general on friendly terms. The Iroquois maintained friendly relations with the Dutch and afterwards with the English This deeply affected relations between the English and the French, as well as the entire development of the province of New York.

French Expansion.—Exploration was a most important incident of both the fur trade and the missionary enterprises of the French. Between 1670 and 1690 their work culminated in the great exploring activity of Marquette, Joliet and La Salle. The Ohio and Mississippi rivers were discovered and their courses were mainly or wholly traced. Explorers also penetrated far into the regions beyond the Mississippi. Posts were established at various points along the Great Lakes. During the first two decades of the 18th century the French also established themselves on the Gulf of Mexico, Mobile being founded in 1702 and New Orleans in 1718 Quebec and the Gulf ports were then connected by a series of forts which, though few and weak, sufficed for communication and for the establishment of a claim to the Mississippi valley. They were Niagara and Detroit, commanding the approaches to lakes Erie and Huron; Fort Miami, on the Maumee river; Fort St. Joseph, at the southern end of Lake Michigan; Vincennes and French Fort, on the Wabash; Fort Chartres, on the Mississippi opposite St. Louis; Michillimackinac and Ste. Marie, which guarded the upper lakes French zeal and enterprise had thus seized upon the heart of the continent. It seemed possible that English settlements might be confined to the coast, for they expanded slowly and no genius for exploration or sympathy with Indian life was shown The tendency of British commercial policy was likewise to confine them there. The Indian alliances of the English were also far less extensive than those of the French. The provinces of South Carolina and Georgia had conflicts with the Spanish on the Florida frontier, and in these the Indian tribes of the south were also involved But these rivalries were slight and local in character when compared with the struggle for supremacy which was preparing between the French and English.

The conflict with the French was precipitated by events in Europe. It was the English Revolution of 1689 that opened the great conflict between France and England. The question of Protestantism versus Catholicism was involved, but at bottom the struggle was one for the balance of power among European States. Rival claims, too, existed between the two powers in America, Africa and Asia. Questions of commercial and naval supremacy world-wide in extent were involved, and the colonial possessions of the two States were necessarily drawn into the struggle. In America it involved four intercolonial wars (Dutch War with France, War of Queen Anne or Spanish Succession, War of Austrian Succession and Seven Years War), which were closed respectively by the treaties of Ryswick (1697), Utrecht (1713), Aix-la-Chapelle (1748), and Paris (1763). On the American continent during the first two wars the struggle was confined to the northern frontier, and consisted of devastating raids by the French and Indians, which in turn provoked retaliatory efforts on the part of the English. These took the form in part of attacks on Acadia and of unsuccessful efforts to conquer Canada by means of joint expeditions by sea and land. The favourite land route was that from New York by way of Lake Champlain to Montreal, while the expeditions by sea were forced to make the long and perilous voyage round Nova Scotia and through the Gulf and River St. Lawrence to Quebec In 1690 and again in 1711 an enterprise of this kind was actually undertaken. Acadia, "with its ancient limits," and the claim of France to Newfoundland and the Hudson Bay territory were, however, ceded to England by the Treaty of Utrecht

Wars Between French and British in America.—As the great world conflict progressed the relative importance of the colonial and maritime issues which were involved increased The first two wars had their origin primarily in European questions The third war had its beginning in the Spanish West Indies, and clearly revealed the existence of the Bourbon Family Compact, which bound France and Spain together On the American continent the most striking event was the capture, in 1745, of Louisburg, a stronghold which the French had recently fortified on Cape Breton. This victory was secured largely by the efforts of the New England colonists. In the following year another plan for the conquest of Canada was thwarted by the necessities of war in Europe. At the close of the war Louisburg, too, was restored to the French. After this fashion did the world struggle react upon the special interests of the English in North America, and perplex and irritate the colonists.

In the fourth intercolonial war (1754–63) the struggle between the two nationalities in North America was decided. Events which immediately preceded this war—the occupation of the Ohio valley and the building of Fort Duquesne—clearly revealed an intention on the part of the French to exclude the English from the Mississippi valley. A persistent effort was also made to recover Acadia. The western, as well as the northern, frontier was now threatened, and the war which followed affected all the Colonies. Great Britain sent over a succession of commanders-in-chief. Great improvement was made upon the crude efforts at joint colonial action which had characterized the earlier wars: the Albany congress of 1754 greatly surpassed in importance the meetings of governors and military officers which had occasionally been held in previous times, though its plan of colonial union failed. The campaigns of this war were all upon a comparatively large scale. Campaigns were carried on not merely along the line of Lake Champlain and in Acadia, but against Fort Duquesne, Oswego and Fort Frontenac, Louisburg and Quebec itself. The weak Spanish power was overthrown in Florida and expeditions were sent against the southern Indians In all quarters, and especially after Pitt became secretary of State, the British assumed the offensive The Navy of Great Britain, as well as its Army, was called into action on a much larger scale in America than ever before. The result was the conquest by the British of Canada, and all North America east of the Mississippi river; the French claim to territory west of this river was ceded to Spain in 1762

The wars with the French brought the problem of colonial defence among the English into greater prominence than ever and added it to the other questions at issue. Against the Indians the colonists in the 17th century had provided for their own defence. Chiefly with this object in view, each Colony had developed a militia system. But such a force was not fitted for long campaigns or large operations: it was comparatively undisciplined; the commissariat was poor or totally lacking, and the men were able to remain away from their homes for only brief periods. The colonists possessed no navy. So poor were means of communication and so isolated were the Colonies from one another, that co-operation was very difficult. Equally difficult was it to secure proportional contributions of money from the Colonies. Early in the French wars the British Government prescribed quotas both of men and money to be raised by the Colonies, but little attention was paid to these except by the Colonies in immediate peril. Because of the limited amount of available money and the modest resources of the colonists heavy taxation was impossible. The assemblies resorted to the issue of bills of credit, to which they gave legal tender quality, and for the redemption of which in nearly all cases they made inadequate provision. The

paper depreciated and in some Colonies became worthless Great confusion resulted, involving loss to all, and among the sufferers were British merchants Strained relations were produced between the assemblies and the colonial executive, who, acting under royal instructions, persisted in vetoing bills for additional issues of currency For this reason, in addition to others, the assemblies withheld the salaries of governors and other officials, and in this way sought to coerce the executives. In some Colonies the assembly secured the right of electing the treasurer, and in most of them appropriations were made specific. Thus by skilfully utilizing their control over the purse, and that during a long period of war, the colonial assemblies were able materially to limit the authority of the executives It was in such ways as these that the Constitutions of the provinces became developed and liberalized during the French wars.

The Canadian Government.—The quality of the rank and file of the Canadian militia was not essentially different from that of the British Colonies. But the Canadian Government was autocratic. The power of the French was also concentrated in a single large province. These conditions greatly promoted military efficiency. When taken in connection with their Indian alliances, they enabled the French to take the offensive in the earlier wars much oftener than did the English, and with much greater effect. The English frontier was more accessible and more exposed than was the lower part of the valley of the St. Lawrence. Quebec was in every sense a citadel to which additional security was given during a large part of every year by the intense cold of the Canadian winter. But so superior were the training and enterprise of the French *coureur de bois* that, with his Indian allies, he was far better able than the English farmer or artisan to penetrate the wilderness, whether in winter or in summer, and massacre the exposed dwellers on the frontier. It was this class which gave the French the superiority in the long succession of raids by which the English frontier was laid waste.

Though the French by their skill and boldness achieved a remarkable success, their defects and weaknesses were equally evident. The flow of population from France to America was never great, and was diminished by the exclusion of Huguenots. The natural growth of population within New France was not rapid and the French colonists did not become sufficiently numerous to maintain the interests to which their vast claims and possessions gave rise. At the opening of the last intercolonial war the proportion of English to French colonists was approximately 15 to one. The resources of the British exceeded those of the French colonists to a corresponding degree. Had the decision of the questions at issue depended upon population and wealth alone, the issue could not long have remained doubtful But they were so offset by other circumstances, already alluded to, that the result of the struggle was for a long time uncertain. The motherlands were to be the decisive factors in the problem, which thus depended to an extent on complications which existed in Europe or even on remoter seas and continents. When the climax of the struggle was reached the result might have been different if France at the time had not been so deeply involved in the politics of central Europe.

Of the first importance in reaching a decision were the fleets and armies of Great Britain and France, or those parts of them which were available for use on the continent of North America. During the larger part of the period under review the French neglected their fleet, while the English steadily advanced toward naval and commercial supremacy. But the first conspicuous service on the northern coasts was that which was rendered by Commodore Peter Warren and his squadron at the capture of Louisburg in 1745. In the next year a large French fleet was despatched to North America, but it accomplished nothing. In the last intercolonial war the operations before Louisburg in 1758 and at Quebec in 1759 decisively proved the superiority of the British Navy. The Colonies also, in the later stages of the struggle, contributed loyally toward the result. France failed to make her natural military superiority effective in North America, and her power on that continent had to yield before the combined attacks of Great Britain and her Colonies by land and sea.

Colonial Revolt, 1763–76.—The Treaty of Paris (1763), by which the period of colonial wars was concluded, added vast stretches of territory to the dominions of Great Britain in North America. The Floridas, Canada and Louisiana as far west as the Mississippi river now came into the possession of the English. Of the islands which were occupied, the two most important—Guadaloupe and Martinique—were restored to the French The retention of Canada in preference to these involved an important change in the nature and objects of British colonization. Hitherto tropical colonies had been preferred to those in northern climes But it was now bent upon continental expansion. Canada and the West were retained and the most important French islands were given back The development of modern industry—the so-called industrial revolution had already begun in Great Britain Its effect was vastly to increase the population of the British Isles and to necessitate an overflow into the unoccupied regions of the globe. Henceforth, as time progressed, colonies were to be valued as homes for a surplus population quite as much as sources of raw materials and food supplies. The retention of Canada and the West also coincided exactly with the desires of the continental Colonies. The chief gains of the war went therefore to them and not to the island colonies. They now possessed a continental domain which was adequate to their need for expansion, and their long-cherished desire to be rid of the French was gratified. The conquest of the French removed the sense of dependence on Great Britain for military aid previously felt by the northern Colonies in particular.

Increase of Imperial Control.—In consequence of the policy thus adopted, largely increased burdens were devolved on the Imperial Government, while the conquest and the events which led to it strengthened imperialist sentiment. The course of action which was at first favoured by leading officials, both in England and the Colonies, was a more systematic administration of Indian affairs, the employment of sufficient regular troops under the commander-in-chief to defend the newly acquired territory, the maintenance of posts with English settlers in the interior on a scale sufficient to prevent the French or Spanish from securing the trade of the region. Improved methods of administration were urged; French methods were praised and the shortcomings of the surviving chartered Colonies were again emphasized This all required additional revenue, as well as administrative vigour, and that at a time when Great Britain was especially burdened with debt and when several of the Colonies had recently incurred heavy expenditures. The large acquisitions of territory also necessitated some changes in the acts of trade. The necessity for their more vigorous enforcement was revealed by the existence of a large contraband trade between the colonists and the enemy during the later years of the war and also of a considerable illegal trade with Europe. These conditions, together with the conviction that, as the continental Colonies had reaped the chief advantages of the war, some favour should be extended to the islands, led to the passage of the Sugar Act by the Grenville ministry in 1764. It also caused a resort to writs of assistance in two of the Colonies, and finally the legalization of them in all the Colonies by Act of Parliament (1767) The aid of the Navy was directly invoked in the enforcement of the trade laws, and the activity of the customs officials and of the admiralty courts in the Colonies was increased. Garrisons of regular troops—numbering several thousand —with a commander-in-chief were now present in the Colonies in time of peace, and their aid might possibly be invoked by the civil power to suppress disorder. The Sugar Act itself was a trade and revenue act combined, and the fact was expressed in the preamble of the measure. It was intended directly to affect the traffic between the northern Colonies and the foreign West Indies in lumber and food-stuffs, molasses and rum. The duty on foreign molasses, for which provision had been made in the Molasses Act of 1733, was halved; but now it was proposed really to collect this duty. A cry was immediately raised in New England that, if the duty was collected, the manufacture of rum—of which molasses was the staple material—would be lessened or wholly prevented and a most important industry sacrificed. The fisheries would incidentally suffer. In spite, however, of the opposition which it provoked in the northern Colonies, it is probable that the Sugar Act could have

been permanently enforced The Act of Trade of 1673 and the Molasses Act—though it was not fully executed—were two early instances of the exercise by Parliament of the right to tax the colonies Had the Sugar Act been enforced, a clear and decisive precedent in favour of this right would have been established. In view of the general situation, that was probably as far as the British Government should have gone at that time But it immediately committed itself to another and still more significant measure, and the two acts combined caused an outburst of protest and resistance from the colonists

The Stamp Act.—Repeatedly in earlier years the imposition of a stamp duty upon the Colonies had been suggested. The cost of the regular troops which must be stationed in America was estimated at about £300,000 annually The Sugar Act was expected to yield about £45,000 a year It was thought that the colonies should raise about £100,000 more as their reasonable share of the cost. George Grenville resolved to secure this by means of a stamp duty. This would fall upon the island colonies equally with those of the continent, though it would be expended chiefly for the enlarged military force on the mainland. Though its simplicity and ease of collection recommended it, the Stamp Act was a purely fiscal measure, and its character was not concealed by any features which allied it to the earlier acts for the regulation of trade. It was passed by Parliament in 1765, almost without debate and with scarcely a thought that it would be resisted It provided for the appointment of officials to distribute the stamped papers in the colonies and further extended the power of the admiralty courts by giving them jurisdiction over violations of this act. The legal theory upon which the act was based was that of the unqualified sovereignty of Parliament as the representative body for the whole empire, and that its authority, if it chose to use it, was as effective for purposes of taxation as for the regulation of trade or other objects of legislation. But never before, during the century and a half of colonial history, had the taxing power been so unqualifiedly exercised It followed close on the heels of the Sugar Act, which itself had aroused much hostile criticism. The two measures also came at a time when the consciousness of strength among the Colonists had been increased by the defeat and expulsion of the French. Moreover, at the time when the policy was initiated, George III. had undertaken to crush the Whig party and to revive the latent prerogatives of his office. This resulted in the formation of a series of coalition ministries. Vacillation and uncertainty were thus introduced into the colonial policy of the Government The royal policy also brought into the public service in England and kept there an unusually large group of inferior men who persistently blundered in the treatment of colonial questions. It was only with the accession of the North ministry, in 1770, that permanence and a certain consistency were secured. But, in the view of the colonists, the prestige of the Government had by that time been seriously lowered

Resistance to the Stamp Act.—Determined opposition to the Stamp Act was shown in all the Colonies, by or before the time (Nov. 1) when it was to go into effect. The forms assumed by this opposition were such as characterized the entire controversy with Great Britain until the opening of hostilities in 1775 It consisted in the passage of resolutions of protest by the lower houses of some of the colonial legislatures; in the calling of a congress at New York which was attended by delegates from nine of the Colonies; in the activity of mobs organized under the name of the "Sons of Liberty"; and, finally, in a somewhat widely extended movement against the importation of British, or even foreign, goods and in favour of frugality and the encouragement of home manufactures. The newspaper press also sprang into much greater activity than ever before, and many notable pamphlets were published. The most important resolutions at the outset were those adopted by the Virginia House of Burgesses and by the House of Representatives of Massachusetts. Through the first-named body the dramatic eloquence of Patrick Henry forced five resolutions. Two others, which threatened resistance and the coercion of any who should venture to uphold the home Government, failed to pass, but the whole seven were published broadcast through the Colonies. The calling of a general congress was proposed by the House of Representatives of Massachusetts. Prominent among its members was James Otis, who had already distinguished himself by radical opposition to measures of the Government, especially in the case against writs of assistance which was argued before the superior court in 1761. Samuel Adams, already a prominent man, was now elected a member of the House from Boston. He almost immediately became its leader, drafting its most important resolutions and papers, and to a large extent directing its policy. With the aid of others he was able greatly to increase the activity of the town-meeting in Boston, and in the course of a few years to develop it on occasion into a great popular convention Throughout New England the town and its institutions served well the purposes of opposition and facilitated its extension over large areas. The intense Puritan spirit, with its century and a half of pronounced independence, both in polity and temper, was lacking outside New England, though on the frontiers of the provinces from Pennsylvania southward was a Scottish-Irish population which exhibited many of the New England characteristics But the tenant farmers of New York, the German pietist sects of Pennsylvania, the Quakers wherever they had settled, and in general the adherents of the English Church were inclined toward indifference or, as the controversy progressed, toward positive loyalism Hence the mixture of nationalities in the middle colonies greatly increased the difficulty of rousing that section to concerted action In Pennsylvania the issues were obscured by a struggle on the part of the western counties to secure equal representation with those of the east. This helped to make loyalists of the Quakers Special grievances also produced among the frontier settlements of North and South Carolina quite as much dislike of the officials and social leaders of the tide-water region as they could possibly feel toward Crown and Parliament. Throughout the struggle New England and Virginia exhibited a unity and decision in action which were not equalled elsewhere

Increased Opposition.—But to return to the Stamp Act. Before the meeting of the congress at New York outbreaks of mob violence in Boston had forced the stamp distributor there to resign, and had wrecked the house of Thomas Hutchinson, the chief justice. Owing largely to the indecision of the elective council, the Government had proved powerless to check the disorder. The resolutions passed by the Congress, as well as its petitions to the home Government, gave authoritative form to the claims of the colonial opposition in general, though the body which issued them, like all the congresses which followed until 1776, was extra-legal. In these utterances, as later, the colonists sought to draw their arguments from British precedents and their own history. The two British rights which, it was claimed, were violated by the Stamp Act were the right to trial by jury and the right to be taxed only by an assembly in which they were represented. The first grievance was simply an incident of the second, and was occasioned by the extension of the jurisdiction of the admiralty courts. The tax was a direct grievance. For purposes of legislation like this these bodies denied that Parliament was representative of the whole empire. For purposes of taxation, their assemblies, they affirmed, were the only representative bodies they had known. Therefore, ignoring the earlier and tentative measures by which Parliament had actually taxed the Colonies, and falling back upon the sweeping declarations of their assemblies, they denied the right of Parliament to tax them. They declared that the recent policy of Parliament was wholly an innovation and insisted upon a return to the constitution as it was before 1763. The doctrine of natural right and compact was also resorted to with increasing emphasis in New England utterances.

Repeal of the Stamp Act.—The decisive blows, however, were struck by the mobs in the Colonies and by the Government itself in England. As the time for the execution of the Stamp Act approached, more or less violent demonstrations occurred in New York and in many other localities. The stamp distributors were forced to resign. Everywhere in the original continental Colonies the use of stamped papers was prevented, except to a slight extent in Georgia. Business requiring the use of stamps was in part suspended, but far more generally it was carried on

without their use. Without the aid of the militia, which in no case was invoked, the colonial executives proved indisposed or powerless to enforce the act and it was effectively nullified. In England the petitions of the colonists produced little effect. There the decisive events were the accession of the Rockingham ministry to power and the clamours of the merchants which were caused by the decline in American trade. The serious lack of adjustment between British politics and colonial government is illustrated by the fact that, more than three months before the Stamp Act was to go into effect, the ministry whose measure it was resigned, and a cabinet which was indifferent, if not hostile, to it was installed in office. Preparations were soon made for its repeal. The slight extent to which relations with the Colonies had been defined is indicated by the fact that the debates over the repeal contain the first serious discussion in parliament of the constitution of the British empire. While the Colonies were practically united in their views a great variety of opinions was expressed in parliament. On the question of right Lord Mansfield affirmed the absolute supremacy of parliament in dominions, while Camden and Pitt drew the same sharp line of distinction between taxation and legislation upon which the colonists insisted, and denied the right of parliament to tax the Colonies. Motives of expediency, arising both from conditions in the colonies and in England, proved decisive, and in the spring of 1766 the Stamp Act was repealed, while its repeal was accompanied with the passage of a statute (The Declaratory Act) affirming the principle that Great Britain had the right to bind the Colonies in all cases whatsoever. This measure was received with joy in the Colonies, but the prestige of the home Government had received a severe blow, and the colonists were quick to resent further alleged encroachments.

Townshend Acts.—These soon came in the form of a colonial Mutiny Act and of the so-called Townshend Acts (1767). The Mutiny Act was intended largely to meet the needs of the troops stationed in the west and in the new Colonies, but it also affected the older Colonies where garrisons of regular soldiers existed. The act provided for a parliamentary requisition for barrack supplies, and partly because it included certain articles which were not required for the soldiers in Europe, the New York legislature at first refused to make the necessary appropriation. Partly through the influence of the governor it later came to think better of it and in a non-committal way appropriated the supplies required. But meantime in England the Pitt-Grafton ministry had come into office, in which the brilliant but reckless Charles Townshend was chancellor of the exchequer. Pitt himself was disabled by illness, and the ministry, lacking his control, steadily disintegrated. Townshend availed himself of this situation to spring upon his colleagues and upon Parliament a new measure for colonial taxation, and with it a bill legalizing writs of assistance and establishing a board of commissioners of the customs in America, and a third bill suspending the functions of the assembly of New York until it should comply with the terms of the Mutiny Act. These bills all became law. Before the last-mentioned one reached the colonies, the New York Assembly had complied, and therefore the necessity for executing this Act of Parliament was avoided. The establishment of a customs board at Boston did not, of itself, provoke much criticism. But the Act of Trade and Revenue, which provided for the collection in the Colonies of duties on glass, lead, painters' colours, paper and tea, and that out of the revenue raised therefrom salaries should be paid to the governors and judges in America, opened anew the controversy over taxation.

John Dickinson, in his *Letters of a Former* (1767–68), denied *in toto* the authority of Parliament to tax the Colonies, and his argument was widely accepted. Massachusetts petitioned the home Government, and in a circular letter conveyed its views to the other colonies and asked an expression of theirs in return. The activity of the customs officials at Boston in seizing John Hancock's sloop, "Liberty," occasioned rioting, which in turn was followed by the transfer of two regiments to Boston. Several vessels of war were also stationed in its harbour (autumn of 1768). Deprived of their assembly, the towns of Massachusetts chose deputies, who met in convention, but without important result. Favourable replies to its circular letter were, however, received from a majority of the Colonies. Resolutions against the new act were passed by many colonial assemblies, and in several cases petitions were sent to England. The King and ministers expressed the view that the Americans were opposed to all restrictions, and that in Massachusetts treason or misprision of treason had already been committed. In this they had the support of large majorities in Parliament. The statute of 35 Henry

THE BOSTON "MASSACRE," MARCH 5, 1770. AFTER AN ENGRAVING ATTRIBUTED TO PAUL REVERE (1735–1818), REVOLUTIONARY PATRIOT

VIII., for the punishment in England of such offences when committed outside the realm, was now revived, and the royal officials in Massachusetts were instructed to collect evidence against suspected popular leaders with a view to their deportation across sea for trial. Though sufficient evidence was not found, nothing could have been better calculated to increase the exasperation of the colonists than a threat of this kind. It drew from the Virginia burgesses strong addresses and resolutions of protest. Fear lest the English Church would induce the Government to establish a colonial episcopate caused much discussion at this time, especially in New England, and led to plans for joint action on the part of Dissenters, in self-defence. In the course of 1769 the policy of commercial non-intercourse was again revived, and resolutions in favour of its enforcement were passed by many local bodies. But it was found difficult to enforce these, and, as the Colonies were prosperous, trade, open and illicit, with Europe continued to be large. The British merchants did not clamour for relief, as they had done at the time of the Stamp Act, but gave loyal support to the policy of the Government. The King was also steadily gaining an ascendancy, which in 1770 was permanently established by the accession of Lord North to the premiership. Thus, on both sides of the ocean, parties were bracing themselves for a struggle, the one for and the other against the principle of the Declaratory Act. The question of revenue was now largely obscured by that of right and power.

The Tea Tax.—It cannot be said that the Townshend Revenue Act was nullified, for to a certain limited extent it was executed. But in 1770, on the specious plea that the duties were uncommercial because they were levied on British manufactures, all except the duty on tea—3d. per lb.—were repealed, and a drawback of one-fourth and later of three-fifths of this duty was granted on the re-exportation of tea to the Colonies. But the preamble of the act was retained, and with it the principle of taxation. For this reason opposition continued and non-importation agreements, especially against tea, were maintained. But after the collision which occurred between the troops and the people in Boston, in

March 1770, the soldiers were removed from that town and affairs became more quiet. For more than a year it seemed as if the controversy was wearing itself out and that the old relations would be restored. But the conduct of certain naval officers and small vessels of war which had been trying to suppress illegal trade in Narragansett bay led, in June 1772, to the destruction of the schooner "Gaspee." The inquiry which necessarily followed this, together with legislation for the protection of the royal dockyards, ships and supplies, again revealed the possibility that colonists might be removed to England for trial. About the same time provision was made for the payment by the home Government of the salaries of the governors and of the judges of the superior court of Massachusetts while those officials continued to hold at the pleasure of the Crown. These events occasioned a movement in Massachusetts and Virginia which led at once to the organization of committees of correspondence, and these ultimately extended far and wide throughout the Colonies. At the same time in England the East India Company appealed to Parliament for relief from the losses caused by the transfer of the American trade so largely to the Dutch, and in response the Tea Act was passed authorizing the company to import its teas into the Colonies and providing that the English duties should be wholly drawn back on exportation, and that no compensation need be made to the Government for consequent loss of revenue This, it was expected, would enable the company to out-compete the Dutch But popular uprisings prevented the reception or sale of the tea at any of the ports and culminated in the destruction (Dec 16, 1773) of 340 chests at Boston. As the King and the North ministry were now fully entrenched in power, coercion was at once resorted to and affairs were thus brought to a crisis.

The Quebec Act.—Those among the colonists who were intelligent enough to watch the course of events had long felt that they were being enveloped in a network of relations over which they had no control. This was a result of the development of the empire, with its world-wide interests. The Quebec Act, which was passed by Parliament near the close of the session of 1774, furnished a case in point. Owing to the failure of the Imperial Government to secure the revenue which it had hoped to collect under the Stamp Act and the later statutes, it had been forced to abandon its plans for the vigorous administration of Indian affairs and of the West. In view of these facts, it was thought wisest and cheapest to commit the immediate charge of the west to the province of Quebec, and therefore to extend its bounds southward to the Ohio. The Roman Catholic religion was recognised as legal within Quebec, and no provision was made for an assembly. Its extension also indicated a purpose to prevent the westward movement of population across the mountains, which was already beginning from the middle and southern Colonies

First Continental Congress.—But the acts of the session of 1774 which were of most immediate importance were those which directly affected Massachusetts, where lay the centre of disturbance. One of these closed the port of Boston, another substituted an appointed for an elected council in Massachusetts and took the selection of jurors out of the hands of the people, and a third made possible the removal from Massachusetts of the trials of persons indicted for capital offences committed in support of the Government into neighbouring Colonies or to Great Britain, where a fair hearing was considered possible. Gen. Thomas Gage, who had been commander-in-chief in America, was now appointed governor of Massachusetts, with authority to uphold the new acts with military force. As soon as knowledge of the fate impending over Boston reached the other Colonies, conventions, local and provincial, were held, and the plan of a general congress, as proposed by Massachusetts and Virginia, was adopted. Delegates were chosen from all the Colonies except Georgia, though that province fell into line when the second Congress met. The members were instructed to the general effect that they should consult together and adopt such measures as were best calculated to secure the just rights of the colonists Voting by Colonies, but occasionally listening to utterances which implied that Americans were now thrown into a single mass, this body sent addresses to the King, to the people of the Colonies, of Quebec and of Great Britain, and prepared a declaration of rights. It is a significant fact that no address was sent to either of the Houses of Parliament. In its statement of rights the Congress (known as the First Continental Congress) limited itself to those which it believed had been infringed since 1763. These acts they described as innovations, and claimed themselves to be the true conservatives who only desired peace on the basis of the former constitution. The opposition which Massachusetts was making to the recent Acts of Parliament was approved, and the view was expressed that, if an attempt were made to execute them by force, all America should support Massachusetts Though the work of this Congress was deliberative, it performed one positive act which contained the germ out of which new governments were to develop. That was the issue of the Association, or non-importation and non-exportation agreement, accompanied with resolutions for the encouragement of agriculture and home manufactures and for the organization of committees to carry these measures into effect. Coercion, according to the principle of the boycott, was to be applied by the Colonies and other local bodies to all who declined to accept and obey the terms of the Association. This policy had been followed at intervals since the time of the Stamp Act. It had been revived by many local and provincial bodies for the past few months. The Association became the touchstone by which loyalty to the Colonies, or to the King, was determined. Those whose loyalty to the King forbade their submission to the new regulations now felt the power of committees, even to the extent of virtual trial, imprisonment or banishment. From this action the First Continental Congress derived its chief significance.

Increase of Friction.—The Association, with its threats and dependence upon extra-legal bodies for enforcement, was a direct blow at the commercial system of the empire and could scarcely help provoking retaliation When the Congress adjourned, some of its members predicted war. In New England the impression that war was inevitable was widespread. In Massachusetts a provincial congress was at once organized, which assumed the reins of government and began to prepare for defence A committee of safety was chosen to carry on the work during recesses of the Congress. Thomas Gage, the governor, began fortifying Boston, while he looked about for opportunities to seize military stores which the colonists were accumulating. The raising of voluntary militia companies was soon begun in Virginia. In South Carolina, as earlier in Boston and New York, a quantity of tea was now actually destroyed, and a general committee assumed practical control of the province. From New York city and Philadelphia, as centres, the process of revolutionizing the two most conservative provinces was carried on. When Parliament met, at the close of 1774, the King and ministers declared that a most daring spirit of resistance existed in Massachusetts, which was countenanced by the other Colonies, where unlawful combinations against the trade of Great Britain were already widely extended. In these opinions the Government had the support of the majority in the two Houses, and in a joint address the rebellion in Massachusetts was declared to be a fact. As a conciliatory measure Chatham proposed that Parliament agree by resolution not to levy any tax upon the Colonies, but that the Continental Congress be required to make a free grant of a perpetual revenue which should be fully at the disposition of Parliament, the Congress fixing the quota which should be paid by each province. But the imperialist and mercantilist ideas of Chatham were expressed in the further provisions that the system of trade and navigation should not be changed and that the Army might be lawfully kept in any part of the dominions, though it should never be used to violate the just rights of the people. Edmund Burke, in his great speech on conciliation, advocated a return to the system of requisitions and did not consider a representation of the colonists in Parliament as a possibility. But these motions were rejected, and a resolution introduced by Lord North was passed. This contained no recognition of extra-legal bodies, but provided that when the assembly of any Colony should engage to support civil government within the Colony and contribute according to its ability to the common defence, the King and Parliament would then forbear to levy any more taxes on that province except what

were necessary for the regulation of trade The Colonies, with the exception of New York, North Carolina and Georgia, were excluded from the fisheries, as a counterstroke to the Association North's resolution proved futile, and the two parties drifted steadily toward war, though the British Government in its military estimates made no adequate provision for meeting the crisis

Lexington and Concord.—On April 19, 1775, hostilities began in Massachusetts. A force was sent overland to Concord, 20m from Boston, to seize or destroy the military stores which the colonists had brought together at that village The minutemen were warned to oppose the approaching force, and at Lexington, a village situated on the road to Concord, occurred a skirmish in which the first blood of the American War of Independence was shed. The troops marched on to Concord and destroyed such of the stores as had not been removed or concealed. On their return march they were pursued by a galling fire from behind fences and buildings, and had it not been for the arrival of a relieving force the command would have been destroyed before it reached the protection of the British vessels of war at Boston. The "Lexington alarm" brought in throngs of militiamen from all parts of New England Officers were appointed by the provincial congress of Massachusetts and by similar bodies in the other Colonies, and immediately the so-called siege of Boston began. Cannon, as well as every other form of military equipment, were now in great demand. In order to secure supplies and at the same time strike a telling blow at British authority in the north, Ticonderoga was surprised and taken on May 10. Men from Connecticut, Massachusetts, and the New Hampshire Grants (later Vermont) co-operated in this enterprise. It was soon followed by a dash into Canada, by steps which involved New York in the affair, and by the organization of a military force under Gen Philip Schuyler for permanent service on the northern frontier. Meantime reinforcements reached Boston, led by Howe, Clinton and Burgoyne, and it was resolved to extend the British lines by occupying the heights of Dorchester on the south and those of Charlestown on the north.

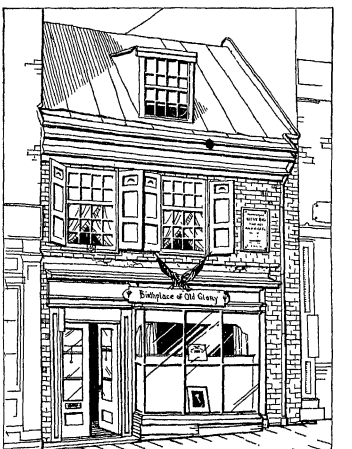
Bunker Hill.—The Americans, hearing of this, seized Breed's Hill, overlooking Charlestown, where they hastily threw up a redoubt on the night of June 16. The British might easily have entrapped them, but instead on the next day the American position was assaulted on the left and carried, though with much difficulty and after a loss to the assailants of more than 1,000 men. Such was the battle of Bunker Hill, one of the most dramatic encounters in the war. In connection with all these events the Americans claimed to be acting on the defensive. But it was not difficult to perceive that, especially in New England, this claim only imperfectly concealed an intensely aggressive spirit.

Second Continental Congress.—The news of the outbreak of hostilities aroused strong feeling throughout the Colonies. The Second Continental Congress met under its influence. Its members, however, had been chosen and instructed before the clash of arms, and for that reason the course which had been worked out for them differed only slightly, if at all, from that which had been followed by their predecessors. To a certain extent the new body adhered to the former course of action. But a state of war now existed in New England and on the Canadian border. Troops were expected soon to arrive at New York Reports of these events were thrust upon the attention of Congress at once, and the provinces involved asked for advice as to what course they should pursue As a result of these events in the Colonies generally, the Association was being changed from a system of co-operation against British trade into a union for purposes of defence This new situation the Congress was forced to meet. This it did largely by resolutions of advice to the Colonies, but also by positive orders. Of the former class were the resolutions about the procuring of military supplies, the assumption of powers of government by the various Colonies, and concerning defence at New York city, on the northern frontier and, later, in the highlands of the Hudson. Of a more decisive character was the appointment of officers for the army, George Washington being made commander-in-chief, the prescribing of their pay, the issue of continental bills of credit, the issue of articles of war, the regulation of trade and of Indian affairs, and the establishment of postal communication As the revolutionary movement progressed through 1775 and the early months of 1776, executive authority in the royal and proprietary provinces collapsed The assemblies were either dissolved or ceased to meet. The governors, their authority gone, retired on board British vessels of war, returned to England or, perchance, found themselves prisoners. This gradual fall of the old governments, imperial and colonial, was the revolution on its negative side. The rise of the system of congresses, conventions and committees, deriving their authority from the people, was the revolution on its positive side, and foreshadowed the new federal system which was rising on the ruins of the half-federated empire.

Collapse of the Royal Governments.—In Connecticut and Rhode Island the corporate system of government, which they had inherited from the 17th century, necessitated no change. The general assemblies always had been the centres of power, and the leading officials were elective for short terms and were subject to the control of the electorate So far as the internal organization of the Colonies was concerned that was all which the revolution demanded In the two proprietary provinces—Pennsylvania and Maryland—the executives were not so directly interested and pledged to support the Imperial Government as were those of the royal provinces. But Governor Robert Eden of Maryland was so tactful that, though the last assembly met in 1774, he was able, with the courts, to keep up some form of government there in the name of the Crown and proprietor until the early summer of 1776. In Pennsylvania the proprietors, though in sympathy with the British Government, never sought actively to influence events in their province. In the royal provinces the prorogation of the legislatures for indefinite or prolonged periods caused them early to disappear—that of Massachusetts in October, 1774 The burgesses of Virginia last met for business in May, 1774 They were prorogued to several later dates, but the governor was never again able to meet them The long and important session of January–March, 1775, was the last ever held by the New York assembly. In April, 1775, Governor John Martin of North Carolina met the assembly for the last time, and even then the provincial convention was in session at the same time and place and the membership of the two bodies was the same In May, 1775, disappeared the assembly of Georgia; in June those of New Hampshire and South Carolina met for the last time. Governor William Franklin was able to meet the assembly of New Jersey as late as November, but months before that date the provincial convention had practically assumed the control of affairs.

Washington in Command.—After Bunker Hill the command at Boston had been transferred from Gage to Sir William Howe. In July, Washington took command of the colonists and gradually established some degree of order and discipline among them. Though the American levies were raw and ever fluctuating in numbers, the British never seriously attempted to break through their lines. Indeed, it was not the plan of the British to make New England the chief seat of war. As early as Aug. 2, 1775, Lord Dartmouth wrote to General Gage on "the obvious advantages that would attend the taking Possession of New York and the hazard of the Army's continuing at Boston." Rhode Island was considered as a convenient naval station, and steps were soon taken to secure possession of it and its surrounding waters The British wished to so plan the war as to secure the maximum of advantage from their fleet. This would give them an easy command of the entire coast, and enable them to secure a foothold at strategic centres. Hence it was that, though the arrival of a fresh supply of cannon enabled Washington to fortify Dorchester Heights, this simply enabled him to hasten a process for which Howe had long been preparing. The evacuation occurred on March 17, 1776, and the British force withdrew temporarily to Halifax. Meantime the bold expeditions of Arnold and Montgomery against Canada had met with only a partial success. Montreal had been occupied, but the assault upon Quebec had failed.

The view, as it was now repeatedly expressed by King and Parliament, was that the colonists were in open rebellion. North's offer of conciliation was peremptorily rejected by Congress. The acts of Parliament were being openly resisted, and Congress in its



manifestos had ignored the two houses. Therefore the British Government stood committed to coercion. That was the meaning of the legislation of the winter of 1776—the prohibition of trade with the rebellious Colonies, the increase of the estimates for the Army and Navy, the employment of German auxiliaries for service in America. Preparations were made to send a large military and naval force the following season, which should operate in part against the insurgents in New York and the southern Colonies and in part through Canada. New England was no longer to be the direct object of attack. The Howes, as commanders of the royal Army and Navy, were appointed commissioners to grant assurance of peace and pardon and the repeal of the obnoxious acts, provided submission was made and some way could be found by Parliament in which an imperial revenue for purposes of defence could be secured from the Colonies. Military operations, meanwhile, should be directed against points of least resistance, and in that way, if possible, the union of the Colonies should be broken. The trend of British policy indicated that an invasion from Canada might be attempted and an effort made to hold Charleston, Philadelphia, and especially New York as strategic points on the coast.

The course of events in the Colonies by which this situation was met was the erection of a system of feeble defences about New York and the removal thither of the Army of about 9,000 men in the spring of 1776; the fitting out of privateers to prey on British commerce; the disarming of loyalists; the opening of American ports to the trade of all peoples who were not subject to the British Crown; and the tentative opening of relations with France. As the result of a combination of ill luck, bad management and American energy the British suffered a repulse at Charleston, South Carolina, in June, which was analogous to the affair of the year before at Bunker Hill, and which necessitated a postponement of their plans in the south.

The Congress and the various revolutionary bodies in the Colonies were forced to carry on war upon a constantly increasing scale. They had to assume powers of government and gradually to perfect their organization for the purpose. Committees in Congress became more permanent. Conditions approximating to those which existed the year before in New England extended through the Colonies generally.

The Declaration of Independence.—On May 15, 1776, as the result of various earlier applications and especially of one from certain Whigs in New York, the Congress recommended to the assemblies and conventions of the Colonies where no Government sufficient to the exigencies of their affairs had been established, "to adopt such government as shall, in the opinion of the representatives of the people, best conduce to the happiness of their constituents in particular and of America in general." The preamble to this resolution set forth as facts the statements that the Colonies had been excluded from the protection of the Crown, that no answer had been given to their petitions for redress, and that the whole force of the kingdom was to be used for their destruction, and therefore that it was no longer reasonable or honest for the colonists to take the oaths or affirmations necessary for the support of Government under the Crown. Though the preamble was warmly debated, it was adopted. And this act marked a turning-point, for the progress of events from that time to the Declaration of Independence was rapid and decisive. The Colonies—now becoming States—one after another, in response to letters from Philadelphia, empowered their delegates to concur in declaring independence. On June 7, R. H. Lee of Virginia introduced in Congress a resolution "that these United Colonies are and of right ought to be free and independent states," that it was expedient forthwith to take effectual measures for securing foreign allies, and that a plan of confederation should be formed. The debate showed that the delegates from the middle colonies and South Carolina could not act, and the decision was postponed for three weeks. In the interval steps were taken to draft a plan of treaties and articles of confederation. A board of war and ordnance, the earliest germ of an executive department, was also created by Congress.

At the end of the three weeks the delegates from all the Colonies except Georgia, South Carolina and New York had received instructions favourable to independence. The two former left their delegates free, and under the influence of the British attack on Charlestown they voted for independence. News had just come that Howe had landed with a large force at Sandy Hook. Under the impression of these stirring events the Declaration, substantially in the form given to it by Thomas Jefferson, was agreed to (July 4, 1776), only three adverse votes being cast. The delegates from New York took no part, but a few days later the act was approved by the convention of that State. The signing of the document by

HOME OF BETSY ROSS, LEGENDARY MAKER OF FIRST AMERICAN FLAG
The little house on Arch Street, Philadelphia, where Mrs. Ross lived at the time she is said to have made the first American flag (1777), was converted into public property by the Betsy Ross Memorial Association in 1905 and has since been known as the American Flag House

the members took place at a later time. Thus triumphed the tendencies toward self-government which had been predominant in the continental Colonies from the first, and which the system of imperial control had only superficially modified and restrained. But the most significant part of the document for the future was the preamble, in which the democratic aspirations of the new nation were set forth, the spirit to which Thomas Paine had just made so powerful an appeal in his *Common Sense*. Governments, it was said, derive their just powers from the consent of the governed, and when any system becomes destructive of these ends it is the right of the people to abolish it and to institute a new Government, establishing it upon such principles and under such forms as seem most likely to effect their safety and happiness. (*See* DECLARATION OF INDEPENDENCE.)

Weakness of the General Government.—Viewed from one standpoint, the Declaration of Independence was apparently an act of the utmost recklessness. The people were by no means a unit in its support, and in several of the States widespread indifference to it, or active sympathy with the British, prevailed. The United States, as yet, had no international status, and it would seem that that must be secured, if at all, by a series of victories which would ensure independence. But how could these be won against the greatest naval power on the globe, supported

by veteran armies of continental and British troops? The Colonies had no money; the few vessels which, as a collective body, they did send out, were more like privateers than anything else Their Army was an undisciplined throng of militiamen, serving on short enlistments, without organized commissariat, and for the most part under inexperienced officers. Its numbers, too, were far inferior to those of the British Taxation by the Continental Congress for the support of the war was not among the possibilities of the case. A strong tendency toward the provision for immediate needs by the issue of bills of credit had been inherited from the period of the French wars, and that device was again resorted to. The battle of Bunker Hill had been immediately followed by an order of Congress for the issue of $2,000,000 in that form of currency. Issues followed in rapidly increasing amounts, until by the close of 1779 $241,000,000 had been authorized. The States put out nearly as much ($209,000,000) The continental paper money depreciated until it became worthless, as to a large extent did that of the States also The States decreed it to be legal tender, and dire threats were uttered against those who refused to receive the bills; but all to no purpose. The Congress also tried to induce the States to tax themselves for the general cause and was forced to rely on requisitions for the purpose. These measures proved as complete a failure as when resorted to by the Crown. The revolution was therefore never financed. It early became necessary to resort to loans and that chiefly from foreign sources It was therefore an absolute necessity that the Colonies should secure international recognition and status Then loans were obtained from the Government of France and Spain and from private bankers in Holland to the amount of about $7,830,000

The collapse of royal Government left the Colonies in a chaotic state. The old institutions had disappeared and new ones could not be immediately developed to take their place. But the institutions of local Government, the town and county systems, were left intact, and upon these as a basis the new fabrics were erected. It was therefore easier to construct the Governments of the States than to define and develop the general Government. At first little else was intended than that the Congress should be the mouthpiece of the patriot party. It proceeded mainly by way of recommendation, and looked to the States, rather than to itself, as the ultimate sources of authority. Upon them it depended for the execution of its measures. As the war proceeded the States grew jealous of the central body and tried to prevent appeals to it from the State courts in prize cases. Under the pressure of war, moreover, the enthusiasm, which had been strong at the outset, declined, and it became increasingly difficult to secure co-operation or sacrifice toward any general enterprise.

Difficulty of Congress.—At the same time, war devolved upon Congress an enormous burden of work. It was forced to devise general policies and provide for their execution, and also to attend to an infinite number of administrative details. Most of the able members were drawn off into the Army, into diplomatic service or official service in the States. Sectional and State jealousies also developed and became intense. As the Congress voted by States the smaller commonwealths were often moved by jealousy of their larger rivals to thwart important measures. But, above all, the conduct of the war and foreign relations occasioned infinite jealousies and cabals, while many of the most important measures seemed to meet with downright indifference. Washington's correspondence abounds in evidence of these facts, while it is well known that he was the object against whom one of the cabals of the time was directed. Benjamin Franklin was the object of somewhat similar jealousies. But, as time passed, rudimentary executive departments, beginning with the board of war and the postmaster general, were developed, and some advance was made toward a working and permanent system. In 1781 the offices of foreign secretary, superintendent of finance, secretary of war and secretary of marine were created.

Military Disasters.—Until almost its very close the campaign of 1776 was a disheartening failure The battle of Long Island was lost by the Americans and, as at Bunker Hill, it would have been quite possible for the British to have captured the entire force which opposed them on Long Island. Howe compelled Washington to evacuate New York city. On Nov. 16 the practical abandonment of the State of New York by the main army was necessitated by the capture of Ft Washington. Earlier in the year the Americans had been compelled to retire from Canada, while the Tories in northern New York were contributing valuable aid to the British

The Tide Turns.—But there was another side to the picture, and already certain faint outlines of it were being discerned The British commander was, at practically every step failing to seize the advantages that were within his reach, while Washington was learning to play a losing game with consummate patience and tact. After Washington had crossed the Delaware, Howe, instead of seizing Philadelphia and driving Congress and the American Army to some remote places of refuge, as he might have done, prepared for winter quarters. Washington seized the opportunity to return across the Delaware and surprise the British outposts at Trenton (Dec. 26, 1776) and Princeton (Jan 3, 1777), and thus secured a safe post of observation for the winter at Morristown Confidence was to an extent restored, the larger part of New Jersey was regained, and many loyalists were compelled to take the oath of allegiance. Howe's plan for the next campaign involved the strengthening of his army by large reinforcements. With this force he proposed to capture Philadelphia and thereby to bring the War of Independence to an end in Pennsylvania, New Jersey and New York New England and the states farther south could then be dealt with in detail. But Howe was overruled by Lord George Germain, the colonial secretary, whose plan included an invasion from Canada, in which Tories and Indians should share, while Howe should advance up the Hudson and meet the northern forces at Albany. If this ambitious scheme should succeed, the British would occupy the valley of the Hudson and New England would be cut off from the rest of the colonies. Gen. Burgoyne was appointed to command the northern expedition. But the failure of the plan was almost ensured from the outset by the neglect on the part of British officials to instruct Gen Howe as to his part in its execution. Burgoyne was forced to surrender near Saratoga on Oct. 17. Meanwhile, Howe, who had long waited for instructions respecting the northern expedition, was finally informed that he might undertake the Pennsylvania campaign, but with the hope that at its close he would still be able to march up the Hudson. Thereupon, embarking his army, Howe sailed for Chesapeake Bay, at the head of which he landed and advanced towards Philadelphia. Washington's army opposed his march at the Brandywine (Chad's Ford), but was defeated (Sept. 11, 1777) and forced to retire beyond Philadelphia. The British then entered the city (Sept. 26) and the Congress withdrew to Lancaster, and later to York, in the interior of Pennsylvania. The British fleet had in the meantime arrived in Delaware Bay, and, after a prolonged and brave defence, had captured Forts Mercer and Mifflin. When winter began the Delaware, as well as lower New York and Rhode Island, was in the possession of the British. With the fragments of an army Washington retired to Valley Forge.

French Alliance.—But the influence of Burgoyne's surrender in Europe was to prove a turning-point in the war. Since 1763 a strong sentiment at the French court had been favourable to a resumption of war with Great Britain. An opportunity was now presented by the colonial revolt. In February 1776 Silas Deane was sent to Paris, ostensibly as a business agent, and with the connivance of the French Government supplies were sent to America and American vessels were received into French ports. Soon American privateers were bringing their prizes into French harbours, and British commerce began to suffer from these attacks. On the French side Beaumarchais and others actively co-operated in this. In the autumn of 1776 Congress appointed three commissioners to France, and resolved that Spain, Prussia, Austria and other European States should be approached with a view to securing recognition and aid. In December 1776 Franklin, who, with Deane and Arthur Lee, had been appointed commissioner to France, arrived at Paris, bringing with him proposals for treaties of commerce and alliance. But, though the attitude of the French court toward the Americans was friendly,

and though it continued to send secret aid, and to exert a favourable influence upon Spain, yet it could not be induced to abandon its outward appearance of neutrality until after the news of Burgoyne's surrender arrived Then the real purpose of the French Government was revealed. On Feb. 6, 1778, the treaties were signed, and in the following summer war between France and England began. The influence of France under the Family Compact, brought Spain into the alliance in April 1779. In October 1779 Henry Laurens was elected minister to the Netherlands, and sailed for Europe, taking with him a plan of a commercial treaty But Laurens and his papers were captured by the British at sea, and partly by that event the Netherlands were forced into war with England. With the other States of northern Europe they undertook to defend the interests of neutrals against the arrogant enforcement by Great Britain of the rights of search at sea. Thus the conflict expanded into a commercial and naval war, Great Britain being confronted by the larger part of Europe

Philadelphia Recaptured.—The conclusion of the treaty of alliance by France was immediately followed by the equipment of a fleet under the comte d'Estaing, which sailed from Toulon in April 1778. Sir Henry Clinton had now succeeded Howe in command of the British army. The certainty that a French fleet would soon appear in American waters made it necessary for the British to evacuate Philadelphia and return to a point on the coast where the army could be in easy communication with the fleet. This fact shows how the French alliance had changed the nature of the war. It now became to a large extent a contest between the two navies, the principal evolutions of which occurred in West Indian and European seas. In the north the British now relatively neglected the land war, and refrained from sending such forces to the eastern coast as had supported Howe in 1776. The Americans, on the other hand, had a naval force upon which they relied, in the hope that the blockade of their coasts might be raised and trade routes opened more freely. On the evacuation of Philadelphia in June Washington's army pursued the British as they retired toward New York, and the indecisive battle of Monmouth was fought on June 28. It did not prevent Clinton from reaching New York, and that city continued to be the centre of British power and operations in the north until the close of the war The Congress returned to Philadelphia. Washington's army came gradually to occupy a line of forts, of which West Point in the highlands of the Hudson was the citadel From there as a centre it was possible to communicate with Newport on the east and with the Delaware region on the south, and at the same time to prevent the British from gaining access to the interior of the country. Though the fleet of D'Estaing carried a heavier equipment of cannon than did that of Admiral Howe, the French commander did not choose to risk an attack on New York, but passed eastward to Newport. Howe followed him, while Washington and his generals planned active co-operation with the new allies by land. But a sudden storm so dispersed and injured the fleets that the French admiral retired to Boston for repairs and later sailed for the West Indies.

State Constitutions.—While the war and foreign relations were thus developing, the States were organising their governments and Congress was beginning to consider articles of confederation between the States. In this way an effort was made to gather up and make permanent the positive results of the revolution. As under the chartered and royal governments of the colonial period the source of political authority had been the Crown, now by a necessary reaction this was sought in the people. This principle had been stated in the Declaration of Independence, and had been implied throughout the earlier controversy. The Colonies had insisted on a more precise definition of the powers of government; they had opposed Parliament because its powers were undefined and therefore dangerous Following these ideas, the States now described their institutions of government and defined their powers by means of written constitutions. These were formulated by the provincial congresses—which had now become the legislatures—or, as they came to insist upon a more specific expression of the popular will, by conventions chosen for the purpose by the electors. Connecticut and Rhode Island retained their colonial charters In the earlier days of hasty and temporary devices, the constitutions, like statutes, had been promulgated by the legislatures which formed them and had been put into force by their authority alone But as time passed and more permanent arrangements became necessary an express popular approval of the instruments was obtained before they were put into force The establishment of State governments in this way began before the issue of the Declaration of Independence It was actively continued during 1776 and the early months of the following year, by which time all of the States had secured at least a temporary constitution. Of the constitutions of the revolutionary period the two most striking features were the bills of rights and the provisions which were made concerning the executives and their relations to the legislatures. The men of that generation were jealous of government. They insisted upon individual rights, not as acquired and guaranteed by the State, but as original, natural and inhering in time prior to all governments. Governments were instituted for the common benefit, protection and security. Officials were trustees and were accountable to the people. There should be no hereditary title to office or power. There should be no titles of nobility, and in Virginia the system of entails was swept away. Monopolies were declared to be inconsistent with the spirit of a free State Freedom of the press and of conscience was asserted, and no obstacles to fair and speedy jury trials were to be tolerated. Elections should be free and frequent, and a preference was expressed for short terms of office. The legislature was universally regarded as the most important department of government. Although the principle of the separation of powers was recognized, in eight States provision was made that the executives should be elected by the legislatures, 11 withheld from them the veto, and the States generally provided for a council to advise them So manifold and important, however, were the restrictions on suffrage that the States were as yet far from being democracies.

The Articles of Confederation.—The first draft of the Articles of Confederation between the States was prepared by John Dickinson in the early summer of 1776 and was reported. Owing to the pressure of war it was then laid aside until the autumn of 1777. By that time the feeling in favour of State sovereignty had so increased that the impossibility of securing assent to the articles in any form had begun to be feared. But the document was completed and submitted to the States in November 1777, when all were encouraged by the news of Burgoyne's surrender. The system for which provision was made in this document was a "confederacy," or "firm league of friendship" between the States The Congress was to be continued, and was to consist of delegates annually appointed by the legislature of each State and paid by their States. No attempt was made to create an executive for the confederacy, though authority was given to Congress to appoint a council of State which should manage general affairs, especially during recesses of Congress. To Congress various general powers were entrusted, as deciding on peace and war and superintending the conduct of the same, building a navy, controlling diplomatic relations, coining money and emitting bills of credit, establishing post offices, regulating Indian trade, adjusting boundary disputes between the States. The financial powers entrusted to Congress included those of borrowing money and determining necessary expenditures, but not the power to tax. For supplies the general government had to depend on requisitions from the States. The same system also had to suffice for the raising and equipment of troops. Congress could not make its laws or orders effective in any matter of importance. This was simply a continuation of the policy under which the revolution was being conducted The control of trade was practically left with the States, the Americans in this matter failing to live up to the requirements of the British system The predominance of the States was further ensured by the provision that no votes, except those for daily adjournment, could be carried without the assent of a majority of all the States, and no important measure without the consent of nine States. But a common citizenship was declared to exist, and Congress received authority to establish a court of appeal which might pass finally

on all disputes between States. Taken as a whole, the Articles of Confederation would bear favourable comparison with other schemes of their kind, and they fairly represented the stage of development to which the American States had then attained.

The West.—We have seen that, on the whole, the attitude of Great Britain, after the peace of 1763, was not favourable to the colonization of the Mississippi valley. To the colonists the Quebec Act gained in offensiveness by seeming to imply that it was intended to exclude them from the West. But all such plans were swept away by the outbreak of the War of Independence. Already, before the beginning of hostilities, emigrants had begun to flock across the mountains. Plans were on foot for the establishment of a number of commonwealths, or proprietary provinces, as the case might be. Daniel Boone and his associates pushed farther west into the Kentucky region, and there it was proposed to establish the commonwealth of Transylvania. Other similar projects were started, all repeating in one form or another the political methods which were used when the seaboard colonies were first settled. The backwoodsmen who managed these enterprises were extreme individualists, believed in the propriety of resistance to governments, and were in full sympathy with the War of Independence. The States which had claims in the West opposed the founding of independent settlements there and, if possible, induced the settlers to be content with the status of counties within some one of the eastern States. After the beginning of the War of Independence, the British from Detroit incited Indian raids for the purpose of destroying or driving out the settlers, especially in Kentucky. These provoked the important expeditions of George Rogers Clark in 1778 and 1779. With a force of Virginians he seized Kaskaskia and later, after a long march, captured Vincennes and compelled General Henry Hamilton, who had come with a relief force from Detroit, to surrender. This secured to the Americans a permanent hold upon the north-west. But Spain, after she entered upon the war, was determined, if possible, to wrest the valley of the Mississippi from the British and to keep all, or the larger part of it, for herself. To that end, operating from New Orleans, her troops took possession of Natchez, and other posts on the lower Mississippi, and occupied Mobile and Pensacola.

Articles of Confederation Ratified.—Within the Confederacy a fundamental line of cleavage was that between the large and small States. It was jealousy on the part of the small ones, their fear lest they might be absorbed by their larger neighbours, which had necessitated the adoption of the plan that in the Congress the delegates should vote by States. When the articles were referred to the States for ratification, the difficulty reappeared. Massachusetts, Connecticut and New York, with Virginia and the three States to the south of it, had large claims to territory between the Appalachians and the Mississippi. New Hampshire, Rhode Island, New Jersey, Delaware and Maryland, which were without hope of westward extension, hesitated to enter the Confederacy, if the large States were to be still further increased by additions to their areas of vast stretches of western country. They insisted that before ratification the States which had claims to western lands should surrender these for the common benefit of the United States. Maryland insisted upon this until, in the end, the cause of State equality and of nationality triumphed. Congress declared that the ceded lands should be formed into States, which should become members of the union with the same rights as other States. When in 1781 the course of action had become possible, Maryland ratified the articles and they came into effect.

War in the South.—So far as the north American continent was concerned, the character of the last stage of the struggle with Great Britain was determined by the fact that the British resolved to transfer the main seat of war to the southern States, in the hope that Georgia and South Carolina might be detached from the union. At the close of 1778 Savannah was captured. In September 1779 D'Estaing returned and assaulted Savannah, but, failing to capture it, sailed for France. In 1780 Clinton sailed from New York, besieged Charleston with a force much superior to that of Lincoln, and captured it (May 12). State government in South Carolina ceased. But the chance of detaching those States from the union and of bringing the war in that region to an end was finally lost by the British. This was chiefly due to an order which recalled the paroles of many of those who had surrendered at Charleston and required that they should perform military service under the British. The attempt to enforce this order, with the barbarities of Colonel Banastre Tarleton and certain Tory bands, provoked a bloody partisan conflict in the upper districts, especially of South Carolina, which contributed more than any other cause to run the scale against the British in the remote south. By the winter of 1781 they were forced back to Charleston and Savannah.

Yorktown.—During the summer of 1780, Washington was prevented from accomplishing anything in the north by the demoralized condition of the finances and by the decline of public spirit. It was very difficult to secure recruits or supplies. The pay of the troops had fallen so into arrears that some of them had already begun to mutiny. A second French squadron and military force, under De Ternay and Rochambeau, landed at Newport, but they were at once shut up there by the British. Clinton and Cornwallis were now planning that Cornwallis, having put down resistance in the remote south, should march through North Carolina and Virginia to Baltimore and Philadelphia and that a junction of the two British forces should be effected which, it was believed, would complete the ruin of the American cause. But the turn of the tide in favour of the Americans began with the partisan warfare in South Carolina, which delayed the northward march of Cornwallis, who retired to Wilmington and thence marched north with a small force into Virginia, and in July retired to Yorktown, in the peninsula of Virginia. Washington and Rochambeau had meantime been planning a joint move against the British at New York, or possibly in Virginia, and a letter was sent to De Grasse, the French admiral in the West Indies, suggesting his co-operation. De Grasse replied that he would sail for the Chesapeake. This confirmed Washington and Rochambeau in the opinion that they should march at once for Virginia and, after junction with the force of Lafayette, co-operate with De Grasse against Cornwallis. By well-timed movements the forces were brought together before Yorktown and Cornwallis was forced to surrender on Oct. 19, 1781.

Treaty of Peace.—This proved to be the last important operation of the war in America. The King was compelled to give way. Rockingham was called into office at the head of a cabinet which considered the recognition of American independence to be indispensable. The negotiations fell into the hands of Shelburne, the friend of Franklin and disciple of Adam Smith. Richard Oswald was the leading British agent, while Franklin, Jay, John Adams and Henry Laurens were the American negotiators. From the first the acknowledgment of independence, the settlement of the boundaries and the freedom of fishing were insisted on as necessary terms by the Americans. The three points were early conceded by the British. They also agreed to restrict Canada to its ancient limits. But discussions later arose over the right to dry fish on the British coasts, over the payment of debts due to British subjects prior to the war and over the compensation of the loyalists. Adams vigorously insisted upon the right to dry and cure fish on British coasts, and finally this concession was secured. Franklin was opposed to the demands of the loyalists, and they had to be content with a futile recommendation by Congress to the States that their claims *should be adjusted*. It was also agreed that creditors on either side should meet with no lawful impediment to the collection of their debts. Both France and Spain considered the claims of the Americans to be excessive, and were not inclined to yield to them. But the Americans negotiated directly with the British and the articles were signed without consultation with the French government. Peace was formally ratified on Sept. 3, 1783.

The American army was now disbanded. Since the close of active military operations both officers and men had been striving to secure their pay, which was hopelessly in arrears. Congress had voted half-pay to the officers for life, and many had agreed to accept a commutation of this in the form of full pay for a certain number of years. Certificates for these amounts were issued. But

in this, as in other cases it was found impossible to procure the money for the purpose from the States Parts of the army repeatedly mutinied, and it was only the influence of Washington which prevented a general outbreak. When the disbandment was finally effected the officers found their certificates depreciated and the states indisposed to honour them They received only a small part of their due, and the privates scarcely anything. STRUGGLE FOR NATIONAL GOVERNMENT, 1783–1865

The long struggle to secure the ratification of the Articles of Confederation had given time for careful consideration of the new scheme of government Maryland's persistent criticism had prepared men to find defects in them Conventions of New England States, pamphlets, and private correspondence had found flaws in the new plan; but a public trial of it was a necessary preliminary to getting rid of it. The efforts of the individual States to maintain the war, the disposition of each State to magnify its own share in the result, the popular jealousy of a superior power, transferred now from parliament to the central government, were enough to ensure the articles some lease of life.

Territorial Cessions.—Congress and its committees had already begun to declare that it was impossible to carry on a government efficiently under the articles Its expostulations were to be continued for several years before they were heard In the meantime it did not neglect the great subject which concerned the essence of nationality—the western territory. Virginia had made a first offer to cede her claims, but it was not accepted. A committee of Congress now made a report (1782) maintaining the validity of the rights which New York had transferred to Congress; and in the next year Virginia made an acceptable offer. Her deed was accepted (March 1, 1784); the other claimant States followed, and Congress, which was not authorized by the articles to hold or govern territory, became the sovereign of a tract of some 430,000 square miles

In this territory Congress had now on its hands the same question of colonial government in which the British Parliament had so signally failed The manner in which Congress dealt with it has made the United States the country that it is. The leading feature of its plan was the erection, as rapidly as possible, of States, similar in powers to the original States. The power of Congress over the territories was to be theoretically absolute, but it was to be exerted in encouraging the development of thorough self-government, and in granting it as fast as the settlers should become capable of exercising it Copied in succeeding acts for the organization of territories, and still controlling the spirit of such acts, the ordinance of 1787 (July 13, 1787) is the foundation of almost everything which makes the American system peculiar.

Difficulties of the Confederation.—In the interval of the settlement of the territorial question the affairs of the "league of friendship," known as the United States, had been going from bad to worse, reaching a crisis in 1786. The public debt amounted in 1783 to about $42,000,000, of which $8,000,000 was owed abroad—in Holland, France and Spain. Congress had no power to levy taxes for the payment of interest or principal; it could only make requisitions on the States. In the four years ending in 1786 requisitions had been made for $10,000,000 and the receipts from them had amounted to but one-fourth of what had been called for Even the interest on the debt was falling into arrears, and the first instalment of the principal fell due in 1787. To pay this, and subsequent annual instalments of $1,000,000, was quite impossible. Robert Morris, the financier of the War of Independence, resigned in 1783 rather than "be the minister of injustice," hoping thus to force upon the States the necessity of granting taxing powers to Congress Washington, on retiring from the command-in-chief, wrote a circular letter to the governors of all the States, urging the necessity of granting to Congress some power to provide a national revenue. Congress (April 18, 1783) appealed to the States for power to levy specific duties on cer-

tain enumerated articles, and 5% on others It was believed that with these duties and the requisitions, which were now to be met by internal taxation, $2,500,000 per annum could be raised The proposal never received the necessary ratification of all the States The obedience to the requisitions grew more lax. In 1786 a committee of Congress reported that any further reliance on requisitions would be "dishonourable to the understandings of those who entertain such confidence."

The States and Congress.—In the States the case was even worse. Some of them had been seduced into issuing paper currency in such profusion that they were almost bankrupt. Great Britain, in the treaty of peace, had recognized the independence of the individual States, naming them in order; and her Government followed the same system in all its intercourse with its late Colonies. Its restrictive system was maintained, and the States, competing with each other for more commerce, could adopt no system of counteracting measures. Every possible burden was thus shifted to American commerce; and Congress could do nothing, for, though it asked for the power to regulate commerce for 15 years, the States refused it. Several States, towards the end of this period, began to prepare or adopt systems of protection of domestic productions or manufactures, aimed at preventing competition by neighbouring States The Tennessee settlers were in insurrection against the authority of North Carolina; the Kentucky settlers were disposed to cut loose from Virginia Poverty, with the rigid execution of process for debt, drove the farmers of western Massachusetts into an insurrection (Shays's Insurrection) which the State had much difficulty in suppressing; and Congress was so incompetent to aid Massachusetts that it was driven to the expedient of imagining an Indian war in that direction, in order to transfer troops thither. Congress itself was in danger of disappearance from the scene. The necessity for the votes of nine of the 13 States for the passage of important measures made the absence of a State's delegation quite as effective as a negative vote. Congress even had to make repeated appeals to obtain a quorum for the ratification of the treaty of peace with Great Britain. In 1784 Congress broke up in disgust, and the French minister reported to his government—"There is now in America no general government—neither Congress, nor president, nor head of any one administrative department."

Congress was evidently incompetent to frame a new plan of national government; its members were too dependent on their States, and would be recalled if they took part in framing anything stronger than the articles. The idea of a convention of the States, independent of Congress, was in the minds and mouths of many; Thomas Paine had suggested it as long ago as his *Common Sense* pamphlet: "Let a continental conference be held . . . to frame a continental charter."

Convention of 1786.—The country drifted into a convention by a roundabout way. The navigation of Chesapeake Bay and the Potomac needed regulation; and the states of Maryland and Virginia, having plenary power in the matter, appointed delegates to arrange such rules. The delegates met (1785) at Alexandria (Va.), and at Washington's house, Mount Vernon (Va), in adopting their report, proposed that Pennsylvania and Delaware be asked to nominate commissioners. Virginia went further and proposed a meeting of commissioners from all the States to frame commercial regulations for the whole. The convention met (1786) at Annapolis (Md), but only five States were represented, and their delegates adjourned, after recommending another convention at Philadelphia in May 1787.

Constitutional Convention.—Congress had failed in its last resort—a proposal that the States should grant it the impost power alone; New York's veto had put an end to this last hope. Confessing its helplessness, Congress approved the call for a second convention; 12 of the States (all but Rhode Island) chose delegates, and the convention met at Philadelphia (May 25, 1787) with an abler body of men than had been seen in Congress since the first two Continental Congresses. Among others, Virginia sent Washington, James Madison, Edmund Randolph, George Mason and George Wythe; Pennsylvania Franklin, Robert, Gouverneur Morris and James Wilson; Massachusetts: Rufus King, Elbridge Gerry and Caleb Strong; Connecticut: William S Johnson, Roger Sherman and Oliver Ellsworth, New York. Alexander Hamilton, New Jersey. William Paterson, and South Carolina the two Pinckneys and John Rutledge With hardly an exception the 55 delegates were clear-headed, moderate men, with positive views of their own and firm purpose, but with a willingness to compromise.

The Virginia Plan.—Washington was chosen to preside, and the convention began the formation of a new Constitution, instead of proposing changes in the old one Two parties were formed at once. The Virginia delegates offered a plan proposing a Congress, of two houses, having power to legislate on national subjects, and to compel the States to fulfil their obligations This was a "large-State" plan, proposed by those States which had or hoped for a large population It meant to base representation in both houses on population, so that the large States could control both of them, and it left the appointment of the president or other executive and the Federal judges to Congress—so that the whole administration of the new government would fall under large-State control

The New Jersey Plan.—On behalf of the "small States" Paterson of New Jersey brought in another plan. It continued the old Confederation, with its single house and equal State vote, but added the power to regulate commerce and raise a revenue, and to compel the States to obey requisitions The large States had a general majority of six to five, but the constant dropping off of one or more votes, on minor features, from their side to that of the small States prevented the hasty adoption of any radical measures. Nevertheless, the final collision could not be evaded, the basis of the two plans was in the question of one or two houses, of equal or proportionate State votes, of large-State supremacy or of State equality. In July the large States began to show a disposition to force their plan through, and the small States began to threaten a concerted withdrawal from the convention

The Compromise.—The Connecticut delegates, from their first appearance in the convention, had favoured a compromise They had been trained under the New England system, in which the assemblies were made up of two houses, one representing the people of the whole State, according to population, and the other giving an equal representation to the towns. They proposed that the new Congress should be made up of two houses, one representing the States in proportion to their population, the other giving an equal vote to each State. At a deadlock the convention referred the proposition to a committee, and it reported in favour of the Connecticut compromise. Connecticut had been voting in the large-State list, and the votes of her delegates could not be spared from their slender majority; now another of the large States, North Carolina, came over to Connecticut's proposal, and it was adopted. Thus the first great struggle of the convention resulted in a compromise, which took shape in an important feature of the Constitution, the Senate.

The small States were still anxious, in every new question, to throw as much power as possible into the hands of their special representative, the Senate; and that body thus obtained its power to act as an executive council as a restraint on the President in appointments and treaties. This was the only survival of the first alignment of parties; but new divisions arose on almost every proposal introduced. The election of the President was given at various times to Congress and to electors chosen by the State legislatures; and the final mode of choice, by electors chosen by the States, was settled only two weeks before the end of the convention, the office of vice president coming in with it The opponents and supporters of the slave trade compromised by agreeing not to prohibit it for 20 years. Another compromise included three-fifths of the slaves in enumerating population for representation. This provision gave the slave-holders abnormal power as the number of slaves increased.

Any explanation of the system introduced by the Constitution must start with the historical fact that, while the national Government was practically suspended, from 1776 until 1789, the only power to which political privileges had been given by the people was the States, and that the State legislatures were, when

the convention met, politically omnipotent, with the exception of the few limitations imposed on them by the early State constitutions. The general rule, then, is that the Federal Government has only the powers granted to it by the Federal Constitution, while the State has all governmental powers not forbidden to it by the State or the Federal Constitution. But the phrase defining the Federal Government's powers is no longer "expressly granted," as in the Articles of Confederation, but merely "granted," so that powers necessary to the execution of granted powers belong to the Federal Government, even though not directly named in the Constitution. This question of the interpretation or "construction" of the Constitution is at the bottom of real national politics in the United States

The Constitution.—Popular sovereignty, then, is the basis of the American system. But it does not, as does the British system, choose its legislative body and leave unlimited powers to it. It makes its "Constitution" the permanent medium of its orders or prohibitons to all branches of the Federal Government and to many branches of the State Governments. they must do what the Constitution directs and leave undone what it forbids The people, therefore, are continually laying their commands on their governments; and they have instituted a system of Federal courts to ensure obedience to their commands A British court must obey the Act of parliament, the American court is bound and sworn to obey the Constitution first, and the Act of Congress or of the State legislature only so far as it is warranted by the Constitution. But the American court does not deal directly with the act in question; it deals with individuals who have a suit before it. One of these individuals relies on an Act of Congress or of a State legislature; the act thus comes before the court for examination; and it supports the act or disregards it as "unconstitutional," or in violation of the Constitution. If the court is one of high rank, or one to which a decision may be appealed, as the U S. Supreme Court, other courts follow the precedent, and the law falls to the ground.

The preamble states that "we, the people of the United States," establish and ordain the Constitution Events have shown that it was the people of the whole United States that established the Constitution, but the people of 1787 seem to have inclined to the belief that it was the people of each State for itself. This belief was never changed in the south; and in 1861 the people of that section believed that the ordinances of secession were merely a repeal of the enacting clause by the power which had passed it, the people of the State. For an account of the form of Government established by the Constitution *see* UNITED STATES· *Constitution and Government*.

The Constitution's leading difference from the Confederation is that it gives the national government power over individuals. The Federal courts are the principal agents in securing this essential power; without them, the Constitution might easily have been as dismal a failure as the Confederation. It has also been a most important agent in securing to the national government its supremacy over the States From this point of view the most important provision of the Constitution is the grant of jurisdiction to Federal courts in cases involving the construction of the Constitution or of laws or treaties made under it. The 25th section of the Judiciary Act of 1789 permitted any Supreme Court justice to grant a writ of error to a State court in a case in which the constitutionality of a Federal law or treaty had been denied, or in which a State law objected to as in violation of the Federal Constitution had been maintained. In such cases, the defeated party had the right to carry the "Federal question" to the Federal courts. It was not until 1816 that the Federal courts undertook to exercise this power; it raised a storm of opposition, but it was maintained, and has made the Constitution what it professed to be—"the supreme law of the land."

Sovereignty.—The system of the United States is almost the only national system, in active and successful operation, as to which the exact location of the sovereignty is still a mooted question. The contention of the Calhoun school—that the separate States were sovereign before and after the adoption of the Constitution, that the Union was purely voluntary, and that the whole people, or the people of all the other States, had no right to maintain or enforce the Union against any State—has been ended by the Civil War. But that did not decide the location of the sovereignty The prevalent opinion is still that first formulated by Madison that the States were sovereign before 1789; that they then gave up a part of their sovereignty to the Federal Government, that the Union and the Constitution were the work of the States, not of the whole people, and that reserved powers are reserved to the people of the States, not to the whole people.

By whatever sovereignty the Constitution was framed and imposed, it was meant only as a scheme in outline, to be filled up afterwards, and from time to time, by legislation The idea is most plainly carried out in the Federal judiciary. the Constitution only directs that there shall be a Supreme Court, and marks out the general jurisdiction of all the courts, leaving Congress, under the restriction of the President's veto power, to build up the system of courts. But the same idea is visible in every department, and it has carried the Constitution safely through a period which has radically altered every other civilized Government It has combined elasticity with the limitations necessary to make democratic government successful over a vast territory, having infinitely diverse interests, and needing, more than almost anything else, positive opportunities for sober second thought by the people. A sudden revolution of popular thought or feeling is enough to change the House of Representatives from top to bottom; it must continue for several years before it can make a radical change in the Senate, and for years longer before it can carry this change through the judiciary, which holds for life; and all these changes must take place before the full effects upon the laws or Constitution are accomplished. But minor changes are reached easily and naturally in the course of legislation

Submission to Congress.—The convention adjourned on Sept. 17, 1787, having adopted the Constitution. Its last step was a resolution that the Constitution be sent to the Congress of the Confederation, with the recommendation that it be submitted to conventions elected by the people of each State for ratification or rejection; that, if nine States should ratify it, Congress should appoint days for the popular election of electors, and that then the new Congress and President should, "without delay, proceed to execute this Constitution." Both Congress and the convention were careful not to open the dangerous question, How was a Government which was not to be changed but by the legislatures of all the States to be entirely supplanted by a different system through the approval of conventions in three-fourths of them?

Action of the States.—Before the end of the year Delaware, Pennsylvania and New Jersey had ratified; and Georgia, Connecticut and Massachusetts followed during the first two months of 1788. Thus far the only strong opposition had been in Massachusetts, a "large State." In it the struggle began between the friends and the opponents of the Constitution, with its introduction of a strong Federal power; and it raged in the conventions, legislatures, newspapers and pamphlets. In a classic series of papers, the *Federalist*, Alexander Hamilton, with the assistance of James Madison and John Jay, explained the new Constitution and defended it.

The seventh and eighth States—Maryland and South Carolina—ratified in April and May 1788; and, while the conventions of Virginia and New York were still wrangling over the great question, the ninth State, New Hampshire, ratified, and the Constitution passed out of theory into fact. The Anti-Federalists of the Virginia and New York conventions offered conditional ratifications of all sorts, but the Federalists stubbornly refused to consider them, and at last, by very slender majorities, these two states ratified North Caroina for a time refused to ratify the Constitution In Rhode Island it was referred to the several towns instead of to a convention and was at first rejected by a majority, the Federalists, who advocated the calling of a convention, refraining from voting Congress named the first Wednesday of January 1789 as the day for the choice of electors, the first Wednesday in February for the choice of President and vice president, and the first Wednesday in March for

the inauguration of the new Government, at New York city. The last date fell on March 4, which continued the limit of each President's term for a century and a half.

When the votes of the electors were counted before Congress, it was found that Washington had been unanimously elected President, and that John Adams, standing next on the list, was vice president. Long before the inauguration the Congress of the Confederation had expired of mere inanition; its attendance simply ran down until (Oct. 21, 1788) its record ceased, and the United States got on without any national government for nearly six months The struggle for nationality had been successful, and the old order faded out of existence.

Slavery.—The first census (1790) followed so closely upon the inauguration of the Constitution that the country may fairly be said to have had a population of near four millions in 1789 Something over half a million of these were slaves, of African birth or blood Slavery of this sort had taken root in almost all the Colonies its original establishment being everywhere by custom. When the custom had been sufficiently established statutes came in to regulate a relation already existing But it is not true, as the Dred Scott decision held long afterwards, that the belief that slaves were chattels simply, things, not persons, held good at the time of the adoption of the Constitution. Times had changed somewhat. The peculiar language of the Constitution itself, describing a slave as a "person held to service or labour," under the laws of any State, puts the general feeling exactly: slaves were persons from whom the laws of some of the States withheld personal rights for the time. In accordance with this feeling most of the Northern States were on the high road towards abolition of slavery. Vermont had never allowed it. In Massachusetts it was swept out by a summary court decision that it was irreconcilable with the new State Constitution. Other States soon began systems of gradual abolition, which finally extinguished slavery north of Maryland, but so gradually that there were still 18 apprentices for life in New Jersey in 1860, the last remnants of the former slave system. In the new States north of the Ohio slavery was prohibited by the ordinance of 1787 and the prohibition was maintained in spite of many attempts to get rid of it and introduce slavery.

The sentiment of thinking men in the south was exactly the same, or in some cases more bitter from their personal entanglement with the system. Jefferson's language as to slavery is irreconcilable with the chattel notion; no abolitionist agitator ever used warmer language than he Washington, George Mason and other southern men were almost as warm against slavery as Jefferson, and there were societies for the abolition of slavery in the south In the Constitutional Convention of 1787 the strongest opposition to an extension of the period of non-interference with the slave trade from 1800 to 1808 came from Virginia, whereas every one of the New England States voted for this extension. Like most slave laws, the laws of the southern states were harsh: rights were almost absolutely withheld from the slave, and punishments of the severest kind were legal, but the execution of the system was milder than its legal possibilities might lead one to imagine. The country was as yet so completely agricultural that southern slavery kept all the patriarchal features possible to such a system.

Industries.—Indeed, the whole country was almost exclusively agricultural, and, in spite of every effort to encourage manufactures by State bounties, they formed the meagrest element in the national production Connecticut, which now teems with manufactures, was just beginning the production of tinware and clocks; Rhode Island and Massachusetts were just beginning to work in cotton from models of jennies and Arkwright machinery surreptitiously obtained from England, and other States, beyond local manufactures of paper, glass and iron, were almost entirely agricultural, or were engaged in industries directly dependent on agriculture.

Population.—There were but five cities in the United States having a population of more than 10,000—New York (33,000), Philadelphia (28,500), Boston (18,000), Charleston (16,000) and Baltimore (13,000). The revenues of the new Government in 1790 were only $4,000,000, the expenditures, excluding interest on the public debt, but $1,000,000. It is not easy for the modern American to realize the poverty and weakness of his country at the inauguration of the new Government

Travel.—Outside the cities communication was slow. One stage a week was enough for the connection between the great cities; and communication elsewhere depended on private conveyance. The western settlements were just beginning to make the question more serious Enterprising land companies were the moving force which had impelled the passage of the ordinance of 1787; and the first column of their settlers was pouring into Ohio and forming connection with their predecessors in Kentucky and Tennessee Marietta and Cincinnati had been founded But the intending settlers were obliged to make the journey down the Ohio river from Pittsburgh in bullet-proof flat-boats, for protection against the Indians, and the return trip depended on the use of oars. For more than 20 years these flat-boats were the chief means of river commerce in the West; and in the longer trips, as to New Orleans the boats were generally broken up at the end and sold for lumber. John Fitch and others were already experimenting on what was soon to be the steamboat; but the statesman of 1789, looking at the task of keeping under one government a country of such distances, with such difficulties of communication, naturally felt anxiety as to the future.

Literature.—The comparative isolation of the people everywhere, the lack of books, the poverty of the schools and newspapers, were all influences which worked strongly against any pronounced literary development. Poems, essays and paintings were feeble imitations of European models; history was annalistic, if anything, and the drama hardly existed In two points the Americans were strong, and had done good work. Such men as Jonathan Edwards had excelled in various departments of theology, and American preaching had reached a high degree of quality and influence, and, in the line of politics, the American State papers rank among the very best of their kind. Having a very clear perception of their political purposes, and having been restricted in study and reading to the great masters of pure and vigorous English, and particularly to the English translators of the Bible, the American leaders came to their work with an English style which could hardly have been improved The writings of Franklin, Washington, the Adamses, Hamilton, Jefferson, Madison, Jay and others show the secret of their strength in every page. Much the same reasons, with the influences of democracy, brought oratory, as represented by Patrick Henry, Fisher Ames, John Randolph and others, to a point not very far below the mark afterwards reached by Daniel Webster The effect of these facts on the subsequent development of the country is not often estimated at its full value

Limits of Settlement.—The cession of the "North-west Territory" by Virginia and New York had been followed by similar cessions by Massachusetts (1785), Connecticut (1786) and South Carolina (1787) North Carolina did not cede Tennessee until early in 1790, nor Georgia her western claims until 1802 Settlement in all these regions was still very sparse The centres of western settlement, in Tennessee and Kentucky, had become more firmly established, and a new one, in Ohio, had just been begun. The whole western limits of settlement of the old 13 States had moved much nearer their present boundaries; and the acquisition of the western title, with the liberal policy of organization and government which had been begun, was to have its first clear effects during the first decade of the new government. Almost the only obstacle to its earlier success had been the doubts as to the attitude which the Spanish authorities, at New Orleans and Madrid, would take towards the new settlements. They had already asserted a claim that the Mississippi was an exclusively Spanish stream from its mouth up to the Yazoo, and that no American boat should be allowed to sail on this part of it. To the western settler the Alleghenies and bad roads were enough to cut him off from any other way to a market than down the Mississippi; and it was not easy to restrain him from a forcible defiance of the Spanish claim. The northern States were willing to allow the Spanish claim for

a period of years in return for a commercial treaty; the southern States and the western settlers protested angrily; and once more the spectre of dissolution appeared, not to be laid again until the new Government had made a treaty with Spain in 1795 securing common navigation of the Mississippi.

The Development of Democracy, 1789–1801.—All the tendencies of political institutions in the United States had been towards democracy; but the leading men were not unanimous in their agreement with this tendency. Not a few of them were pronounced republicans even before 1775, but the mass of them had no great objections to a monarchical form of government until the war spirit had converted them The Declaration of Independence had been directed rather against *the* King than against *a* king Even after popular sovereignty had pronounced against a king, class spirit was for some time a fair substitute for aristocracy As often happens, democracy at least thought of a Caesar when it apprehended class control. Certain discontented officers of the Continental Army proposed to Washington that he become king, but he promptly and indignantly put the offer by.

The State constitutions were democratic, except for property or other restrictions on the right of suffrage, or provisions carefully designed to keep the control of at least one house of the State legislature "in the hands of property" The Federal Constitution was so drawn that it would have lent itself kindly either to class control or to democracy. The electoral system of choosing the President and vice president was altogether anti-democratic, though democracy has conquered it· not an elector, since 1796, has disobeyed the purely moral claim of his party to control his choice. Since the Senate was to be chosen by the State legislatures, "property," if it could retain its influence in those bodies, could control at least one house of Congress. Whether the Constitution was to have a democratic or an anti-democratic interpretation was to be settled in the next 12 years.

Immigration.—The States were a strong factor in the final settlement, from the fact that the Constitution had left to them the control of the elective franchise: they were to make its conditions what each of them saw fit Religious tests for the right of suffrage had been quite common in the Colonies; property tests were almost universal. The religious tests disappeared shortly after the War of Independence; the property tests survived in some of the States far into the constitutional period. But the desire to attract immigration was always a strong impelling force to induce States, especially frontier States, to make the acquisition of full citizenship and political rights as easy and rapid as possible. This force was not so strong at first as it was after the great stream of immigration began about 1848, but it was enough to tend constantly to the development of democracy.

Organization of the New Government.—The Anti-Federalists had been a political party, but a party with but one principle. The absolute failure of that principle deprived the party of all cohesion; and the Federalists controlled the first two Congresses almost entirely Their pronounced ability was shown in their organizing measures, which still govern the American system very largely. The departments of State, of the Treasury, of War, of Justice and of the Post Office were rapidly and successfully organized; acts were passed for the regulation of seamen, commerce, tonnage duties, lighthouses, intercourse with the Indians, territories and the militia; a national capital was selected; a national bank was chartered; the national debt was funded, and the State debts were assumed as part of it. The first four years of the new system showed that the States had now to deal with a very different power from the impotent Congress of the Confederation. The new power was even able to exert pressure upon the two States which had not ratified the Constitution. As a first step, the higher duties imposed on imports from foreign countries were expressly directed to apply to imports from North Carolina and Rhode Island. North Carolina having called a second convention, her case was left to the course of nature; the second convention ratified the Constitution (Nov. 21, 1789). The Rhode Island legislature asked that their State might not be considered altogether foreigners, made their duties agree with those of the new government, and reserved the proceeds for "continental" purposes. Still no further steps were taken. A bill was therefore introduced, directing the President to suspend commercial intercourse with Rhode Island, and to demand from her her share of the continental debt. This was passed by the Senate, and needed but two steps further to become law Newspaper proposals to divide the little State between her two nearest neighbours were stopped by her ratification of the Constitution (May 29, 1790). The "old 13" were thus united under the Constitution; and yet, so strong is the American prejudice for the autonomy of the States that these last two were allowed to enter in the full conviction that they did so in the exercise of sovereign freedom of choice.

Protection.—Protection was begun in the first tariff act, whose object, said its preamble, was the protection of domestic manufactures. The duties, however, ranged only from 7½ to 10%, averaging about 8½% The system, too, had rather a political than an economic basis. Until 1789 the States had controlled the imposition of duties. The separate State feeling was a factor so strong that secession was a possibility which every statesman had to take into account Hamilton's object, in introducing the system, seems to have been to create a class of manufacturers, running through all the States, but dependent for prosperity on the new Federal Government and its tariff. This would be a force which would make strongly against any attempt at secession. The same feeling seems to have been at the bottom of his establishment of a national bank, his assumption of State debts, and most of the general scheme which his influence forced upon the Federalist Party.

The First Cabinet.—In forming his cabinet Washington had paid attention to the opposing elements which had united for the temporary purpose of ratifying the Constitution. The national element was represented by Hamilton, secretary of the Treasury, and Henry Knox, secretary of War; the particularist element (using the term to indicate support of the States, not of a State) by Jefferson, secretary of State, and Edmund Randolph, Attorney General At the end of 1792 matters were in train for the general recognition of the existence of two parties, whose struggles were to decide the course of the Constitution's development. The occasion came in the opening of 1793, when the new nation was first brought into contact with the French Revolution

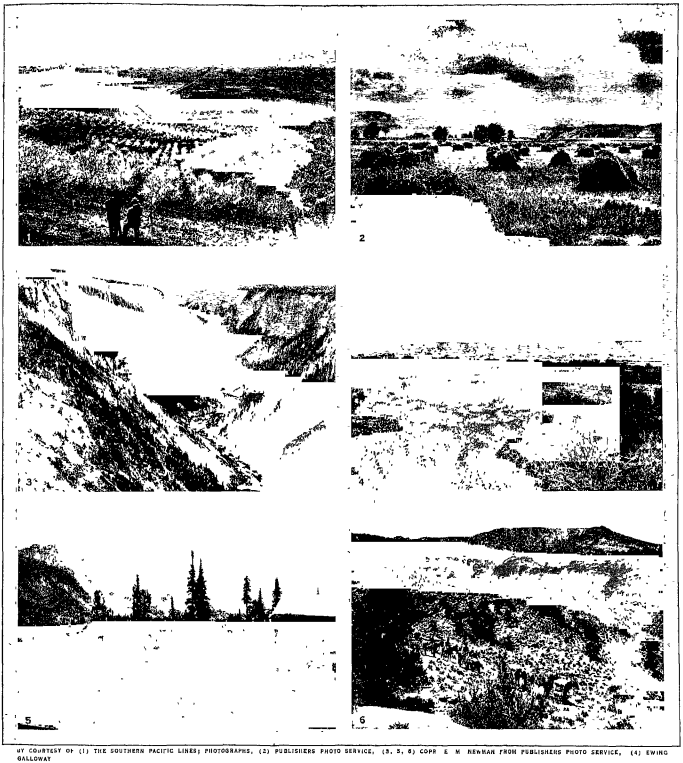
Jefferson.—The controlling tendency of Jefferson and his school was to the maintenance of individual rights at the highest possible point, as the Hamilton school was always ready to assert the national power to restrict individual rights for the general good The Jefferson school supported the States, in the belief that they were the best bulwarks for individual rights When the French Revolution began its course in America by agitation for the "rights of man," it met a sympathetic audience in the Jefferson party and a cold and unsympathetic hearing from the Hamilton school of Federalists, who were far more interested in securing the full recognition of the power and rights of the nation than in securing the individual against imaginary dangers, as they thought them. For ten years the surface marks of distinction between the two parties were to be connected with the course of events in Europe.

Hamilton.—The new Government was not yet four years old; it was not familiar, nor of assured permanency. The only national governments of which Americans had had previous experience were the British Government and the Confederation: in the British they had had no share, and the Confederation had had no power. The only places in which they had had long-continued, full and familiar experience of self-government were their State Governments. The governing principle of the Hamilton school, that the construction or interpretation of the terms of the Constitution was to be such as to broaden the powers of the Federal Government, necessarily involved a corresponding trenching on the powers of the States. It was natural, then, that the Jefferson school should look on every feature of the Hamilton programme as "anti-republican." The disposition of the Jefferson school to claim for themselves a certain peculiar title to the position of "republicans" developed into the appearance of the first Repub-

lican, or the Democratic-Republican, Party, about 1793.

Parties.—Many of the Federalists were shrewd and active business men, who naturally took prompt advantage of the opportunities which the new system offered The Republicans therefore believed and asserted that the whole Hamilton programme was dictated by selfish or class interest, and they added this to the accusation of monarchical tendencies These charges, with the fundamental differences of mental constitution, exasperated by the passion which differences as to the French Revolution seemed to carry with them everywhere, made the political history of this decade a very unpleasant record The provision for establishing the national capital on the Potomac (1790) was declared to have been carried by a corrupt bargain; and accusations of corruption were renewed at every opportunity In 1793 a French agent, Edmond Charles Edouard Genet (1765–1834), appeared to claim the assistance of the United States for the French republic, and went to the length of commissioning privateers, and endeavouring to secure recruits. Washington decided to issue a proclamation of neutrality, the first act of the kind in American history. It was the first indication, also, of the policy which has made the course of every President, with the exception of Polk, a determined leaning to peace, even when the other branches of the Government have been intent on war. Genet, however, continued his activities, and made outrageous demands upon the Government, so that finally Washington demanded and secured (1794) his recall The proclamation of 1793 brought about the first distinctly party feeling; and it was intensified by Washington's charge that popular opposition in western Pennsylvania (1794) to the new excise law (*see* WHISKY INSURRECTION) had been fomented by the extreme French party. Their name, Democrat, was applied by the Federalists to the whole Republican Party as a term of contempt, but it was not accepted by the party for some 20 years; then the compound title "Democratic-Republican" became, as it long remained, the official title of the party. There was no party opposition, however, to the re-election of Washington in 1792, or to the admission of Vermont (1791), Kentucky (1792) and Tennessee (1796) as new States

Jay's Treaty.—The British Government had accredited no minister to the United States, and it refused to make any commercial treaty or to give up the forts in the western territory of the United States, through which its agents still exercised a commanding influence over the Indians In the course of its war with France, the neutral American vessels, without the protection of a national navy, fared badly. A treaty negotiated in 1794 by Chief Justice John Jay settled these difficulties for the following 12 years. But, as it engaged the United States against any intervention in the war on behalf of France, was silent on the subject of the right of search, and agreed to irksome limitations on the commercial privileges of the United States, the Republicans made it very unpopular, and the bitter personal attacks on Washington grew out of it. In spite of occasional Republican successes, the Federalists retained a general control of national affairs; they elected John Adams President in 1796, though Jefferson was chosen vice president with him; and the national policy of the Federalists kept the country out of entangling alliances with any of the European belligerents. To the Republicans, and to the French republic, this last point of policy was only a practical intervention against France and against the rights of man



At the end of Washington's Administration the French Directory broke off relations with the United States, demanding the abrogation of Jay's treaty and a more pronounced sympathy with France. Adams sent three envoys, C. C Pinckney, John Marshall and Eibridge Gerry, to endeavour to re-establish the former relations; they were met by demands for "money, a great deal of money," as a prerequisite to peace. They refused; their letters home were published, and the Federalists at last had the opportunity of riding the whirlwind of an intense popular desire for war with France. Intercourse with France was suspended by Congress (1798); the treaties with France were declared at an end; American frigates were authorized to capture French vessels guilty of depredations on American commerce, and the President was authorized to issue letters of marque and reprisal; and an American Army was formed, Washington being called from his retirement at Mount Vernon to command it. The war never went beyond a few sea fights, in which the little American Navy did itself credit, and Napoleon, seizing power the next year, renewed the peace which should never have been broken

Decline of the Federalists.—The reaction in Great Britain against the indefinite "rights of man" had led Parliament to pass an alien law, a sedition law suspending the writ of *habeas corpus* and an act giving wide and loosely defined powers to magistrates for the dispersion of meetings to petition for redress of grievances The Federalists were in control of a Congress of limited powers; but they were strongly tempted by sympathies and antipathies of every sort to form their programme on the model furnished from England. The measures which they actually passed were based only on that construction of the Constitution which is at the bottom of all American politics; they only tended to force the Constitution into an anti-democratic direction But it was the fixed belief of their opponents that they meant to go farther, and to secure control by some wholesale measure of political persecution

The Alien and Sedition Laws.—Three alien laws were passed in June and July, 1798. The first (repealed in April, 1802) raised the number of years necessary for naturalization from five to 14 The third permitted the arrest or removal of subjects of any foreign power with which the United States should be at war. The second, which is usually known as the Alien Law, was limited to a term of two years; it permitted the President to arrest or order out of the country any alien whom he should consider dangerous to the country. As many of the Republican editors and local leaders were aliens, this law really put a large part of the Republican organization in the power of the President The Sedition Law (to be in force until March, 1801, and not renewed) made it a crime, punishable by fine and imprisonment, to publish or print any false, scandalous and malicious writings against the Government of the United States, either house of Congress, or the President, or to stir up sedition or opposition to any lawful act of Congress or of the President, or to aid the designs of any foreign power against the United States. In its first form the bill was even more sweeping than this and alarmed the opposition.

Most of the ability of the country was in the Federalist ranks; the Republicans had but two first-rate men—Jefferson and Madison. In the sudden issue thus forced between individual rights and national power, Jefferson and Madison could find but one bulwark for the individual—the power of the States; and their use of it gave their party a pronounced list to State sovereignty from which it did not recover for years They objected to the Alien Law on the grounds that aliens were under the jurisdiction of the State, not of the Federal Government, that the jurisdiction over them had not been transferred to the Federal Government by the Constitution, and that the assumption of it by Congress was a violation of the Constitution's reservation of powers to the States; and, further, because the Constitution reserved to every "person," not to every citizen, the right to a jury trial. They objected to the Sedition Law on the grounds that the Constitution had specified exactly the four crimes for whose punishment Congress was to provide; that criminal libel was not one of them; and that the 1st amendment forbade Congress to pass any law restricting freedom of speech or of the press

Virginia and Kentucky Resolutions.—The Republican objections might have been made in court, on the first trial. But the Republican leaders had strong doubts of the impartiality of the Federal judges, who were Federalists. They resolved to entrench the party in the State legislatures The Virginia legislature in 1798 passed a series of resolutions prepared by Madison, and the Kentucky legislature in the same year passed a series prepared by Jefferson Neglected or rejected by the other States, they were passed again by their legislatures in 1799. The leading idea expressed in both was that the Constitution was a "compact" between the States, and that the powers (the States) which had made the compact had reserved the power to restrain the creature of the compact, the Federal Government, whenever it undertook

PUBLIC BUILDINGS IN WASHINGTON D. C. AND VICINITY

1. The Mansion at Mt Vernon, Virginia, about 15 miles south of Washington, D C. Long owned by members of the Washington family, this property in 1761 came into the possession of George Washington, who in 1785–86 greatly enlarged and improved it, and made it his home until his death in 1799
2. The Lee Mansion at Arlington, Virginia, opposite Washington, D C., built in 1802 by George Washington Parke Custis, the adopted son of George Washington George Hadfield, architect At the beginning of the Civil War it was the property of Robert E Lee, son-in-law of Custis, who became commander-in-chief of the Confederate Army. This mansion, the Tomb of the Unknown Soldier and the Memorial Amphitheatre, are now notable features of Arlington National Cemetery
3. The Lincoln Memorial, designed by Henry Bacon. There are 36 columns, one for each state in the union at the time of the death of Abraham Lincoln in 1865
4. The Garden front of the Executive Mansion, Washington, D.C., better known as "The White House." George Washington was present at the laying of the corner stone in 1792 and John Adams was the first president to live in the building. Architect, James Hoban
5. The United States Treasury building completed in 1869. The site was selected by President Jackson and the structure now covers 120,000 square feet of ground. Robert Mills, architect
6. Washington Monument, 555 feet high, erected as a memorial to George Washington. It was begun in 1848 and completed in 1884. Robert Mills, architect
7. The Capitol building at Washington The southeast corner stone of the original building was laid by President Washington in 1793 and the first building was completed in 1827 The present dome was completed in 1865. William Thornton, Stephen Hallet, B. H. Latrobe, Charles Bulfinch and Thomas U. Walter, architects

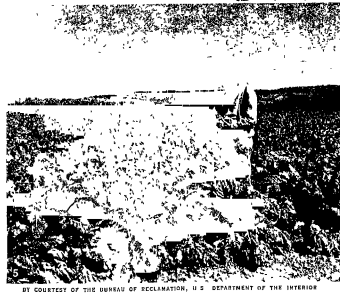
FAMOUS LANDMARKS IN UNITED STATES HISTORY



1. The Nelson House at Yorktown, Va , home of Governor Thomas Nelson, built in 1740. During the Revolutionary War it was used as staff headquarters by Lord Cornwallis A cannon ball can be seen embedded under the apex of the gable
2. The Ford House at Morristown, N.J , where General Washington and his staff made their headquarters for a time during the Revolutionary War Preserved by the Daughters of the American Revolution
3. The Alamo, formerly a Franciscan mission, at San Antonio, Tex. There in 1836, in the war for Texan Independence, Colonels Travis, Crockett and Bowie, with 180 men, withstood 4,000 Mexicans for 13 days, killing 500 attackers before being overpowered and slain
4. Independence Hall, Philadelphia, Pa Begun in the year 1729 and completed in 1734 this building was known as the States House until the adoption of the Declaration of Independence within its walls in 1776. Originally designed by Dr. John Kearsley
5. San Gabriel Mission, one of a chain of Franciscan missions between San Diego and San Francisco, Calif It was founded in 1771
6. Fort McHenry, Locust Point, Baltimore, Md During the bombardment of this fort by the British in 1814 Francis Scott Key composed *The Star-Spangled Banner*
7. Liberty Bell in Independence Hall. The bell was rung after the signing of the Declaration of Independence in 1776 It cracked in 1835 when it was rung at the death of Chief Justice John Marshall
8. A section of the moat of Fort Marion, St Augustine, Fla. This fort is a fairly well preserved specimen of Spanish military architecture. Begun about 1638 and completed in 1756

to assume powers not granted to it. Madison's idea seems to have been that the restraint was to be imposed by a second convention of the States. Jefferson's idea is more doubtful; if it meant that the restraint should be imposed by any state which should feel aggrieved, his scheme was merely Calhoun's idea of nullification; but there are some indications that he agreed with Madison.

The first Congress of Adams's term of office ended in 1799. Its successor, elected in the heat of the French war excitement, kept the Federalist policy up to its first pitch. Out of Congress the execution of the objectionable laws had taken the shape of political persecution. Men were arrested, tried and punished for writings which the people had been accustomed to consider within legitimate political methods. The Republican leaders made every trial as public as possible, and gained votes constantly, so that the Federalists began to be shy of the very powers which they had sought Every new election was a storm signal for the Federalist Party, and the danger was increased by schism in their own ranks

Election of 1800.—Hamilton was now a private citizen of New York, but he had the confidence of his party more largely than its nominal head, the President, and he maintained close and confidential relations with the cabinet which Adams had taken unchanged from Washington. The Hamilton faction saw no way of preserving and consolidating the newly acquired powers of the Federal Government but by keeping up and increasing the war feeling against France; Adams had the instinctive leaning of an American President towards peace. Amid cries of wrath and despair from his party he accepted the first overtures of the new Napoleonic Government, sent envoys to negotiate a peace, and ordered them to depart for France when they delayed. Then, discovering flat treachery in his cabinet, he dismissed it and blurted out a public expression of his feeling that Hamilton and his adherents were "a British faction." Hamilton retorted with a circular letter to his party friends, denouncing the President; the Republicans intercepted it and gave it a wider circulation than its author had intended. The result depended on the electoral vote of New York; and Aaron Burr, who had introduced the drill and machinery of a modern American political party there, had made the State Republican and secured a majority for the Republican candidates These (Jefferson and Burr) received the same number of electoral votes (73) and the House of Representatives (controlled by the Federalists) was thus called upon to decide which should be President There was an effort by the Federalists to disappoint the Republicans by making Burr President, but Jefferson obtained that office, Burr becoming vice president for four years. This disputed election, however, led to the adoption in 1804 of the 12th amendment to the Constitution, which prescribed that each elector should vote separately for president and vice president, and thus prevent another tie vote of this kind.

The "Revolution of 1800" decided the future development of the United States. The new dominant party entered upon its career weighted with the theory of State sovereignty; and a civil war was necessary before this dogma, put to use again in the service of slavery, could be banished But the democratic development never was checked As the Republicans obtained control of the States they altered the State constitutions so as to cut out all the arrangements that favoured property or class interests, and reduced political power to the dead level of manhood suffrage. In most of the States outside of New England this process was completed before 1815; but New England tenacity was proof against the advancing revolution until about 1820 For 20 years after its downfall of 1800 the Federalist party maintained its hopeless struggle, and then it faded away into nothing, leaving as its permanent memorial the excellent organization of the Federal Government, which its successful rival hardly changed. Its two successors—the Whig and the second Republican party—have also been broad-constructionist parties, but they have admitted democracy as well.

The New Capital.—The disputed election of 1800 was decided in the new capital city of Washington, to which the Government had just been removed, after having been for ten years at Philadelphia Its streets and parks existed only on paper. The Capitol had been begun; the Executive Mansion was unfinished, and its audience room was used by Mrs. Adams as a drying room for clothes; the congressmen could hardly find lodgings The inconveniences were only an exaggeration of the condition of other American cities. Their sanitary conditions were bad, and yellow fever and cholera from time to time reduced several of them almost to depopulation. More than once during this decade the fever visited Philadelphia and New York, drove out most of the people, and left grass growing in the streets. The communication between the cities was still wretched The traveller was subject to every danger that bad roads, bad carriages, bad horses, bad inns and bad police protection could combine to inflict upon him.

The West.—About this time the term "the West" appears. It meant then the western part of New York, the new territory north of the Ohio, and Kentucky and Tennessee. In settling land boundaries New York had transferred (1786) to Massachusetts, whose claims crossed her territory, the right to (but not jurisdiction over) a large tract of land in central New York, and to another large tract in the Erie basin The sale of this land had carried population considerably west of the Hudson. Between 1790 and 1800 the population of Ohio had risen from almost nothing to 45,000, that of Tennessee from 36,000 to 106,000, and that of Kentucky from 74,000 to 221,000—the last-named State now exceeding six of the "old 13" in population. The difficulties of the western emigrant, however, were still enormous. He obtained land of his own, fertile land and plenty of it, but little else. The produce of the soil had to be consumed at home, or near it; ready money was scarce and distant products scarcer; and comforts, except the very rudest substitutes of home manufacture, were unobtainable. The number of post offices rose during these ten years from 75 to 903; the miles of post routes from 1,900 to 21,000, and the revenue from $38,000 to $231,000.

Patents.—The power of Congress to regulate patents was already bearing fruit. Until 1789 this power was in the hands of the States, and the privileges of the inventor were restricted to the territory of the patenting State. Now he had a vast and growing territory within which all the profits were his own. Twenty patents were issued in 1793, and 23,471 100 years later. One of the inventions of 1793 was Eli Whitney's cotton gin

Cotton.—When the Constitution was adopted it was not known that the cultivation of cotton could be made profitable in the southern States. The "roller gin" could clean only 6 lb. a day by slave labour. In 1784 eight bags of cotton, landed in Liverpool from an American ship, had been seized on the ground that so much cotton could not be the produce of the United States. Eli Whitney invented the saw-gin, by which the cotton was dragged through parallel wires with openings too narrow to allow the seeds to pass; and one slave could now clean 1,000 lb. a day. The exports of cotton leaped from 189,000 lb. in 1791 to 21,000,000 lb. in 1801, and doubled in three years more. The influence of this one invention, combined with the wonderful series of British inventions which had paved the way for it, can hardly be estimated in its commercial aspects. Its political influences were even wider, but more unhappy. The introduction of the commercial element into the slave system of the South robbed it at once of the patriarchal features which had made it tolerable; while it developed in slaveholders a new disposition to defend a system of slave labour as a "positive good."

Slavery.—The development of a class whose profits were merely the extorted natural wages of the black labourer was certain; and its political power was as certain, though it never showed itself clearly until after 1830. And this class was to have a peculiarly distorting effect on the political history of the United States. Aristocratic in every sense but one, it was ultra-Democratic (in a purely party sense) in its devotion to State sovereignty, for the legal basis of the slave system was in the laws of the several States. In time the aristocratic element got control of the party which had originally looked to State rights as a bulwark of individual rights; and the party was finally committed to the employment of its original doctrine for an entirely different purpose—the suppression of the black labourer's wages.

Democracy and Nationality, 1801–29.—When Jefferson took office in 1801 his party, ignoring the natural forces which

tied the States together even against their wills, insisted that the legal basis of the bond was in the power of any State to withdraw at will This was no nationality; and foreign nations naturally refused to take the American national coin at any higher valuation than that at which it was current in its own country The urgent necessity was for a reconciliation between democracy and nationality; and this was the work of this period. An underlying sense of all this has led Democratic leaders to call the war of 1812–15 the "Second War of Independence"; the result was Independence of past ideas as the first had been of Great Britain

Louisiana.—The first force in the new direction was the acquisition of Louisiana in 1803. Napoleon had acquired it from Spain, and, fearing an attack upon it by Great Britain, offered it to the United States for $15,000,000. The Constitution gave the Federal Government no power to buy and hold territory, and the party was based on a strict construction of the Constitution. Possession of power forced the strict-construction party to broaden its ideas, and Louisiana was bought, though Jefferson quieted his conscience by talking for a time of a futile proposal to amend the Constitution so as to grant the necessary power. The acquisition of the western Mississippi basin more than doubled the area of the United States, and gave them control of all the great river systems of central North America The difficulties of using these rivers were removed almost immediately by Robert Fulton's utilization of steam in navigation (1807). Within four years steamboats were at work on western waters, and thereafter the increase of steam navigation and that of population stimulated one another. The centre of population during this period advanced from about the middle of Maryland to its earlier extreme western limit; that is, the centre of population was in 1830 nearly at the place which had been the western limit of population in 1770

The Oregon Country.—Jefferson also laid the basis for a further acquisition in the future by sending an expedition under Meriwether Lewis and William Clark to explore the territory north of the then Spanish territory of California and west of the Rocky Mountains—the "Oregon country" as it was afterwards called. The explorations of this party (1804–06), with Capt. Robert Gray's discovery of the Columbia river (1792), made the best part of the claims of the United States to the country 40 years later.

Election of 1804.—Jefferson was re-elected in 1804. His great success as President was the acquisition of Louisiana, which was a violation of his party principles; but all his minor successes were, like this, recognitions of the national sovereignty which he disliked so much. After a short and brilliant naval war the Barbary pirates were reduced to submission (1805). The long-continued control of New Orleans by Spain, and the persistent intrigues of the Spanish authorities, looking towards a separation of the whole western country from the United States, had been ended by the acquisition of Louisiana. There still existed a dangerous ignorance of Federal power and control, of which Aaron Burr took advantage (1806–07). Organizing an expedition in Kentucky and Tennessee, probably for the conquest of the Spanish colony of Mexico, he was arrested on the lower Mississippi and brought back to Virginia He was acquitted; but the incident opened up a vaster view of the national authority than democracy had yet been able to take.

Jefferson and his party persistently refused to recognize the inherent power of the nation in international affairs. The Jay treaty expired in 1806 and American commerce was left to the course of events, Jefferson refusing to accept the only treaty which the British Government was willing to make. All the difficulties which followed may be summed up in a few words: the British Government was then the representative of the ancient system of restriction of commerce, and had a powerful Navy to enforce its ideas; the American Government was endeavouring to force into international recognition the system of neutral rights and unrestricted commerce, but its suspicious democracy refused to give it a navy sufficient to command respect.

Neutral Commerce.—Great Britain was now at war, from time to time, with almost every other nation of Europe. In time of peace European nations followed generally the old restrictive principle of allowing another nation, like the United States, no commercial access to their colonies; but, when they were at war with Great Britain, whose Navy controlled the ocean, they were very willing to allow the neutral American merchantmen to carry away their surplus colonial produce. Great Britain had insisted for 50 years that the neutral nation, in such cases, was really intervening in the war as an ally of her enemy; but she had so far modified her claim as to admit that "transhipment," or breaking bulk, in the United States was enough to qualify the commerce for recognition. The neutral nation thus gained a double freight, and grew rich in the traffic; the belligerent nations no longer had commerce afloat for British vessels to capture, and the "frauds of the neutral flags" became a standing subject of complaint among British merchants and naval officers. About 1805 British prize courts began to disregard transhipment and to condemn American vessels which made the voyage from a European colony to the mother country by way of the United States.

Impressment.—The question of expatriation, too, furnished a good many burning grievances. Great Britain maintained the old German rule of perpetual allegiance, though she had modified it by allowing the right of emigration. The United States, founded by immigration, was anxious to establish the right of the subject to divest himself of allegiance by naturalization under a foreign jurisdiction. Four facts thus tended to break off friendly relations: (1) Great Britain's claim to allegiance over American naturalized subjects; (2) her claim to the belligerent right of search of neutral vessels; (3) her claim of right to impress for her vessels of war her subjects who were seamen wherever found; and (4) the difficulty of distinguishing native-born American from British subjects, even if the right to impress naturalized American subjects were granted. British naval officers even undertook to consider all who spoke the English language as British subjects, unless they could produce proof that they were native-born Americans. The American sailor who lost his papers was thus open to impressment. A particularly flagrant case of seizure of Americans occurred in 1807. On June 27 the British ship "Leopard" fired upon the American frigate "Chesapeake," which, after having lost three men killed and 18 wounded, hauled down its flag; the British commander then seized four of the "Chesapeake's" crew. This action aroused intense anger throughout the country, and but for the impotence of the Government would undoubtedly have led to immediate war. The American Government in 1810 published the cases of such impressments since 1803 as numbering over 4,000, about one-third of the cases resulting in the discharge of the impressed man.

In May, 1806, the British Government, by orders in council, declared a blockade of the whole continent of Europe from Brest to the Elbe, about 800 miles. In November, after the battle of Jena, Napoleon answered by the "Berlin decree," in which he assumed to blockade the British Isles, thus beginning his "continental system." A year later the British Government answered by further orders in council, forbidding American trade with any country from which the British flag was excluded, allowing direct trade from the United States to Sweden only, in American products, and permitting American trade with other parts of Europe only on condition of touching in England and paying duties. Napoleon retorted with the "Milan decree," declaring good prize any vessel which should submit to search by a British ship; but this was evidently a vain fulmination.

The Navy.—The Democratic Party of the United States was almost exclusively agricultural and had little sympathy with commercial interests; it was pledged to the reduction of national expenses and the debt, and did not wish to take up the responsibility for a navy; and, as the section of country most affected by the orders in council, New England, was Federalist, a tinge of political feeling could not but colour the decisions of the dominant party. Various ridiculous proposals were considered as substitutes for a necessarily naval war; and perhaps the most ridiculous was adopted. Since the use of non-intercourse agreements as revolutionary weapons against Great Britain, an overweening confidence in such measures had sprung up, and one of them was now resorted to—the embargo of Dec. 22, 1807, forbidding foreign commerce altogether. It was expected to starve Great Britain

into a change of policy; and its effects may be seen by comparing the $20,000,000 exports of 1790, $49,000,000 of 1807 and $9,000,000 of 1808. It does not seem to have struck those who passed the measure that the agricultural districts also might find the change unpleasant; but that was the result, and their complaints reinforced those of New England. The pressure had been slightly relieved by the substitution of the Non-Intercourse Law of March 1, 1809; it prohibited commercial intercourse with Great Britain and France and their dependencies, leaving other foreign commerce open, prohibited the importation from any quarter of British and French goods, and forbade the entrance of British or French vessels, public or private, into any port of the United States. Madison, Jefferson's secretary of State, who succeeded Jefferson in 1809, assumed in the Presidency a burden which was not enviable New England was in a ferment, and was suspected of designs to resist the restrictive system by force; and the Administration did not face the future with confidence.

The War of 1812.—The Non-Intercourse Law was to be in force only "until the end of the next session of Congress" and was to be abandoned as to either belligerent which should abandon its attacks on neutral commerce, and maintained against the other. In 1810 the American Government was led to believe that France had abandoned its system. Napoleon continued to enforce it in fact; but his official fiction served its purpose of limiting the non-intercourse for the future to Great Britain, and thus straining relations between that country and the United States still further. The elections of 1811–12 resulted everywhere in the defeat of "submission men" and in the choice of new members who were determined to resort to war against Great Britain. Henry Clay, John C. Calhoun, William H. Crawford and other new men seized the lead in the two houses of Congress, and forced Madison, it is said, to agree to a declaration of war as a condition of his renomination in 1812. Madison sent to Congress a confidential "war message" on June 1 and on the 18th war was declared. The national democracy meant to attack Great Britain in Canada, partly to gratify its western constituency, who had been harassed by Indian attacks, asserted to have been instigated from Canada. Premonitions of success were drawn from the battle of Tippecanoe, in which William Henry Harrison had defeated in 1811 the north-western league of Indians formed by Tecumseh. Between the solidly settled Atlantic States and the Canadian frontier was a wide stretch of unsettled or thinly settled country, which was itself a formidable obstacle to war. Ohio had been admitted as a State in 1802, and Louisiana was admitted in 1812; but their admission had been due to the desire to grant them self-government rather than to their full development in population and resources. Cincinnati was a little settlement of 2,500 inhabitants; the fringe of settled country ran not very far north of it; all beyond was a wilderness. The case was much the same with western New York. It would have been far less costly, as events proved, to have entered at once upon a naval war; but the crusade against Canada had been proclaimed all through Kentucky and the west, and their people were determined to wipe out their old scores before the conclusion of the war. (For the military and naval events of the war *see* WAR OF 1812, THE.)

The war opened with disaster—Gen William Hull's surrender of Detroit; and disaster attended it for two years Political appointments to positions in the regular army were numerous and such officers were worse than useless. Futile attempts at invasion were followed by defeat or abortion, until the political officers were weeded out at the end of the year 1813, and Jacob Brown, Winfield Scott, E. W. Ripley and others who had fought their way up were put in command. Then for the first time the men were drilled and brought into effective condition; two successful battles in 1814—Chippewa and Lundy's Lane—threw some glory on the end of the war So weak were the preparations even for defence that a British expedition in 1814 met no effective resistance when it landed and burned Washington.

The American Navy was but a puny adversary for the British Navy, which had captured or shut up in port all the other navies of Europe. But the small number of American vessels, with the superabundance of trained officers, gave them one great advantage: the training and discipline of the men, and the equipment of the vessels, had been brought to the very highest point. "The art of handling and fighting the old broadside sailing frigate" had been carried in the little American Navy to an excellence which unvarying success and a tendency to fleet-combats had now made far less common among British captains. Altogether the American vessels gave a remarkably good account of themselves.

Hartford Convention.—The home dislike to the war had increased steadily with the evidence of incompetent management by the administration The Federalists, who had always desired a navy, pointed to the naval successes as the best proof of folly with which the war had been undertaken. New England Federalists complained that the Federal Government utterly neglected the defence of their coast, and that southern influence was far too strong in national affairs. They showed at every opportunity a disposition to adopt the furthest stretch of State sovereignty, as stated in the Kentucky resolutions; and every such development urged the national democracy unconsciously further on the road to nationality. When the New England States sent delegates to meet at Hartford (Conn), and consider their grievances and the best remedies, treason was suspected, and a readiness to suppress it by force was plainly shown. The recommendations of the convention came to nothing; but the attitude of the dominant party towards it is one of the symptoms of the manner in which the trials of actual war were steadily reconciling democracy and nationality. The object which Hamilton had sought by high tariffs and the development of national classes had been attained by more natural and healthy means.

Peace.—In April, 1814, the first abdication of Napoleon took place, and Great Britain was able to give more attention to her American antagonist The main attack was to be made on Louisiana, the weakest and most distant portion of the Union. A fleet and army were sent thither, but the British assault was completely repulsed (Jan. 8, 1815) by the Americans under Andrew Jackson Peace had been made at Ghent 15 days before the battle was fought, but the news of the battle and the peace reached Washington almost together.

The United States secured a fairly good treaty. It is true that it said not a word about the questions of impressment, search and neutral rights, the grounds of the war; Great Britain did not abandon her position on any of them. But everybody knew that circumstances had changed. The new naval power whose frigates alone in the past 20 years had shown their ability to fight Engiish frigates on equal terms was not likely to be troubled in future with the question of impressment; and in fact, while not renouncing the right, the British Government no longer attempted to enforce it.

End of Federal Party.—The remainder of this period is one of the barrenest in American history The opposition of the Federalist Party to the war completed the measure of its unpopularity, and it had only a perfunctory existence for a few years longer Scandal, intrigue and personal criticism became the most marked characteristics of American politics until the dominant party broke at the end of the period, and real party conflict was renewed. But the seeds of the final disruption are visible from the peace of 1814. The old-fashioned Republicans looked with intense suspicion on the new form of Republicanism generated by the war, a type which instinctively bent its energies toward the further development of national power. Clay was the natural leader of the new Democracy; but John Quincy Adams and others of Federalist antecedents or leanings took to the new doctrines kindly; and even Calhoun, Crawford and others of the southern interest were at first strongly inclined to support them. One of the first effects was the revival of protection and of a national bank.

The Bank.—The charter of the national bank had expired in 1811, and the dominant party had refused to recharter it. The attempt to carry on the war by loans resulted in almost a bankruptcy and in a complete inability to act efficiently. As soon as peace gave time for consideration, a second bank was chartered (April 10, 1816) for 20 years with a capital of $35,000,000, one-fifth of which was to be subscribed for by the national Govern-

ment It was to have the custody of the Government revenues, but the secretary of the Treasury could divert the revenues to other custodians, giving his reasons for such action to Congress

Protection.—Protection was advocated again on national grounds, but not quite on those which had moved Hamilton. The additional receipts were now to be expended for fortifications and other national defences, and for national roads and canals The war and blockade had been an active form of protection, under which American manufactures had sprung up. As soon as peace was made English manufacturers drove their American rivals out of business or reduced them to desperate straits. Their cries for relief had a double effect. They gave the spur to the nationalizing advocates of protection, and, as most of the manufacturers were in New England or New York, they developed in the citadel of Federalism a class which looked for help to a Republican Congress This was the main force which brought New England into the Republican fold before 1825. An increase in the number of spindles from 80,000 in 1811 to 500,000 in 1815, and in cotton consumption from 500 bales in 1800 to 90,000 in 1815, the rise of manufacturing towns, and the rapid development of the mechanical tendencies of a people who had been hitherto almost exclusively agricultural, were influences which were to be reckoned with in the politics of a democratic country.

Tariff of 1816.—The tariff of 1816 imposed a duty of about 25% on imports of cotton and woollen goods, and specific duties on iron imports, except pig-iron, on which there was an *ad valorem* duty of 20%. In 1818 this duty also was made specific (50 cents a cwt.). The *ad valorem* duties carried most of the manufacturers through the financial crisis of 1818–19, but the iron duties were less satisfactory. In English manufacture the substitution of coke for charcoal in iron production led to continual decrease in price. As the price went down the specific duties were continually increasing the absolute amount of protection. Thus spared the necessity for improvements in production, the American manufacturers felt English competition more keenly as the years went by, and called for more protection

Era of Good Feeling.—James Monroe succeeded Madison as President in 1817, and, re-elected with hardly any opposition in 1820, he served until 1825. So complete was the supremacy of the Republican Party that this is often called "the era of good feeling" It came to an end when a successor to Monroe was to be elected; the two sections of the dominant party then had their first opportunity for open struggle. During Monroe's two terms of office the nationalizing party developed the policy on which it proposed to manage national affairs. This was largely the product of the continually swelling western movement of population. The influence of the steamboat was felt more and more every year, and the want of a similar improvement in land transport was correspondingly evident The attention drawn to western New York by the war had filled that part of the State with a new population. The southern Indians had been completely overthrown by Andrew Jackson during the war of 1812, and forced to cede their lands. The admission of the new States of Indiana (1816), Mississippi (1817), Illinois (1818), Alabama (1819), Maine (1820) and Missouri (1821)—all but Maine the product and evidence of western growth—were the immediate results of the development consequent upon the war. All the territory east of the Mississippi, except the northern part of the North-west Territory, was now formed into self-governing States; the State system had crossed the Mississippi; all that was needed for further development was the locomotive engine. The 4,000,000 of 1790 had grown into 13,000,000 in 1830.

The "American System."—The urgent demand of western settlers for some road to a market led to a variety of schemes to facilitate intercourse between the east and the west—the most successful being that completed in New York in 1825, the Erie canal. The Hudson river forms the great natural breach in the barrier range which runs parallel to the Atlantic coast. When the traveller has passed up the Hudson through that range he sees before him a vast champaign country extending westward to the Great Lakes, and perfectly adapted by nature for a canal. Such a canal, to turn western traffic into the lake rivers and through the lakes, the canal, and the Hudson to New York city, was begun by the State through the influence of De Witt Clinton It was derisively called "Clinton's big ditch" until its completion laid the foundations for the great commercial prosperity of New York State and city Long before it was finished the evident certainty of its success had enticed other States into far less successful enterprises of the kind and had established as a nationalizing policy the combination of high tariffs and expenditures for internal improvements which was long known as the "American system." The tariffs or duties on imports were to be carried as high as revenue results would justify; the superabundant revenues were to be expended on enterprises which would tend to aid the people to subdue the continent Protection was now to be for national benefit, not for the benefit of classes Western farmers were to have manufacturing towns at their doors, as markets for the surplus which had hitherto been rotting on their farms; competition among manufacturers was to keep down prices; and Henry Clay's eloquence was to commend the whole policy to the people The old democracy, particularly in the south, insisted that the whole scheme really had its basis in benefits to classes, that its communistic features were not such as the Constitution meant to cover by its grant of power to Congress to levy taxation for the general welfare. The dissatisfaction in the South rose higher when the tariffs were increased in 1824 and 1828. The proportion of customs revenue to dutiable imports rose to 37% in 1825 and to 44% in 1829; and the ratio to aggregate imports to 33% in 1825 and 37% in 1829

The Monroe Doctrine.—In international relations the action of the Government was strong, quiet and self-respecting. Its first weighty action took place in 1823. It had become pretty evident that the Holy Alliance meant to aid Spain in bringing her revolted South American colonies to obedience. Great Britain had been drifting steadily away from the alliance, and George Canning, the new secretary, determined to call in the weight of the transatlantic power as a check upon it. A hint to the American minister was followed by a few pregnant passages in Monroe's annual message in December. "We could not view," he said, "any interposition for the purpose of oppressing them [the South American States], or controlling in any other manner their destiny by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States" If both the United States and Great Britain were to take this ground the fate of a fleet sent by the Alliance across the Atlantic was not in much doubt, and the project was at once given up.

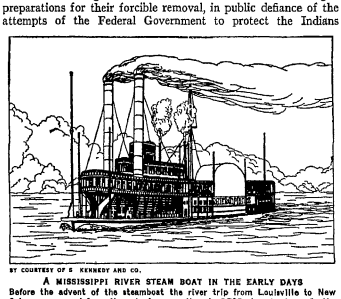
It was supposed at the time that Spain might transfer her colonial claims to some stronger power, and Monroe therefore said that "the American continents, by the free and independent condition which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European powers." This declaration and that quoted above constitute together the "Monroe Doctrine" as originally proclaimed. The doctrine has remained the rule of foreign intercourse for all American parties.

Oregon.—By a treaty with Russia (1825) that power gave up all claims on the Pacific coast south of the present limits of Alaska. The northern boundary of the United States had been defined by the treaty of 1783; and, after the acquisition of Louisiana, a convention with Great Britain (1818) settled the boundary on the line of 49° N lat. as far west as the Rocky Mountains. West of these mountains the so-called Oregon country, on whose limits the two powers could not agree, was to be held in common possession for ten years. This common possession was prolonged by another convention (1827) indefinitely, with the privilege to either power to terminate it, on giving 12 months' notice. This arrangement lasted until 1846.

Election of 1824.—Monroe's term of office came to an end in March 1825. He had originally been an extreme Democrat, who could hardly speak of Washington with patience; he had slowly modified his views, and his tendencies were now eagerly claimed by the few remaining Federalists as identical with their own. All the candidates for the Presidency in 1824—Andrew Jackson, a private citizen of Tennessee; William H Crawford, Monroe's

secretary of the treasury; John Quincy Adams, his secretary of State; and Henry Clay, the Speaker of the House of Representatives—claimed to be Republicans alike; but the personal nature of the struggle was shown by the tendency of their supporters to call themselves "Adams men" or "Jackson men," rather than by any real party title. Calhoun was supported by all groups for the vice presidency, and was elected without difficulty. The choice of a president was more doubtful.

Party Changes.—None of the four candidates had anything like a party organization behind him. Adams and Clay represented the nationalizing element, as Crawford and Jackson did not; but there the likeness among them stopped. The strongest forces behind Adams were the new manufacturing and commercial interests of the East; behind Clay were the desires of the West for internal improvements: and the two elements were soon to be united into the National Republican or Whig Party. Crawford was the representative of the old Democratic Party, with all its Southern influences and leanings. Jackson was the personification of the new democracy—not very cultured, perhaps, but honest, and hating every shade of class control instinctively As he became better known the whole force of the new drift of things turned in his direction. Crawford was taken out of the race, just after the electors had cast their votes, by physical failure, and Adams, later, by the revival of ancient quarrels with the Federalists of New England; and the future was to be with Clay or with Jackson. But in 1824 the electors gave no one a majority; and the House of Representatives, voting by States, gave the presidency to Adams



Adams' election in 1825 was due to the fact that Clay's friends in the House—unable to vote for him, as he was the lowest in the electoral vote, and only three names were open to choice in the House—very naturally gave their votes to Adams. As Adams appointed Clay to the leading position in his cabinet, the defeated party at once raised the cry of "bargain and intrigue," one of the most effective in a democracy, and it was kept up throughout Adams' four years of office. Jackson had received the largest number of electoral votes, though not a majority and the hazy notion that he had been injured because of his devotion to the people increased his popularity. Though demagogues made use of it for selfish purposes, this feeling was an honest one, and Adams had nothing to oppose to it. He tried vigorously to uphold the "American system," and succeeded in passing the tariff of 1828, he tried to maintain the influence of the United States on both the American continents; but he remained as unpopular as his rival grew popular. In 1828 Adams was easily displaced by Jackson, the electoral vote being 178 to 83. Calhoun was re-elected vice president.

Triumph of Jackson.—Jackson's inauguration in 1829 closes this period, as it ends the time during which a disruption of the Union by the peaceable withdrawal of any State was even possible. The party which had made State sovereignty its bulwark in 1798 was now in control of the Government again; but Jackson's proclamation in his first term, in which he warned South Carolina that "disunion by armed force is treason," and that blood must flow if the laws were resisted, speaks a very different tone from the speculations of Jefferson on possible future divisions of the United States. Even the sudden attempt of South Carolina to exercise independent action shows that some interest dependent upon State sovereignty had taken alarm at the drift of events, and was anxious to lodge a claim to the right before it should slip from its fingers for ever.

Slavery.—When the vast territory of Louisiana was acquired in 1803 the new owner found slavery already established there. Congress tacitly ratified existing law by taking no action; slavery continued legal, and spread further through the territory; and the State of Louisiana entered as a slave State in 1812. The next State to be carved out of the territory was Missouri, admitted in 1821. A territory, on applying for admission as a State, brings a Constitution for inspection by Congress; and when it was found that the new State of Missouri proposed to recognize and continue slavery, a vigorous opposition spread through the North and West, and carried most of the senators and representatives from those sections with it. In the House of Representatives these two sections had a greatly superior number of members; but, as the number of Northern and Southern States had been kept about equal, the compact Southern vote, with one or two Northern allies, generally retained control of the Senate. Admitted by the Senate and rejected by the House, Missouri's application hung suspended for two years until it was successful by the admission of Maine, a balancing Northern State, and by the following arrangement, known as the Missouri Compromise of 1820. Missouri was to enter as a slave State; slavery was forever prohibited throughout the rest of the Louisiana Purchase north of lat. 36° 36′, the main southern boundary of Missouri; and, though nothing was said of the territory south of the compromise line, it was understood that any State formed out of it was to be a slave State, if it so wished. Arkansas entered under this provision in 1836.

The question of slavery was thus set at rest for the present, though a few agitators were roused to more zealous opposition to the essence of slavery itself. In the next decade these agitators succeeded only in the conversion of a few recruits, but these recruits were the ones who took up the work at the opening of the next period. It is plain now, however, that North and South had already drifted so far apart as to form two sections, and it became evident during the next forty years that the wants and desires of these two sections were so divergent that it was impossible for one Government to make satisfactory laws for both.

The Settled Area.—The vast flood of human beings which had been pouring westward for years had now pretty well occupied the territory east of the Mississippi, while, on the west side of that stream, it still showed a disposition to hold to the river valleys. The settled area had increased from 240,000sq m. in 1790 to 633,000sq.m in 1830, with an average of 20·3 persons to the sq mile. There was still a great deal of Indian territory in the Southern States of Georgia, Alabama, Mississippi and Florida, for the Southern Indians were among the finest of their race; they had become semi-civilized, and were formidable antagonists to the encroaching white race. The States interested had begun preparations for their forcible removal, in public defiance of the attempts of the Federal Government to protect the Indians

BY COURTESY OF S. KENNEDY AND CO.

A MISSISSIPPI RIVER STEAM BOAT IN THE EARLY DAYS

Before the advent of the steamboat the river trip from Louisville to New Orleans consumed from three to four months. In 1820 steamboats made the trip in less than 20 days; and in 1836, in 6 days. This improved facility of transportation was influential in increasing the population of the Mississippi Valley

(1827); but the removal was not completed until 1835. In the North, Wisconsin and Michigan, with the northern halves of Illinois and Indiana, were still very thinly settled, but everything indicated early increase of population. The first lake steamboat, the "Walk-in-the-Water," had appeared at Detroit in 1818, and the opening of the Erie canal in 1825 added more vessels.

The land system of the United States had much to do with the early development of the West. From the first settlement, the universally recognized rule had been that of absolute individual property in land, with its corollary of unrestricted competitive

or "rack" rents; and this rule was accepted fully in the national land system. The public lands were to be divided into "hundreds" each ten miles square and containng 100 mile-square plots The hundred was called a "township," and was afterwards reduced to six miles square, of 36 mile-square plots of 640ac each. From time to time principal meridians and east and west base lines have been run, and townships have been determined by their relations to these lines. The price fixed in 1790 as a minimum was $2 per ac ; in 1820 it was reduced to $1.25 per ac ; it has tended to decrease, and no effort has ever been made to gain a revenue from it When the nation acqured its western terntory it secured its title to the soil, and always made it a fundamental condition of the admission of a new State that it should not tax United States lands. To compensate the new States for the freedom of unsold public lands from taxation, one township in each 36 was reserved to them for educational purposes; and the excellent public school systems of the Western States have been founded on this provision. The cost of obtaining a quarter section (160ac.), under the still later homestead system of granting lands to actual settlers, came to be only about $26 to cover fees for filing claim and granting title; the interest on this, at 6%, represents an annual rent of one cent per acre—making this, says F A. Walker, as nearly as possible the "no-rent land" of the economists.

The bulk of the early westward migration was of home production; the great immigration from Europe did not begin until about 1847 The West as well as the East thus had its institutions fixed before being called upon to absorb an enormous foreign element.

Industrial Development and Sectional Divergence, 1829–50.—The years 1829–37 have been called "the reign of Andrew Jackson"; his popularity, long struggle for the presidency, and his feeling of his official ownership of the subordinate offices gave to his administration at least an appearance of Caesarism. But it was a strictly constitutional Caesarism; the restraints of written law were never violated, though the methods adopted within the law were new to national politics. Since about 1800 State politics in New York and Pennsylvania had been noted for the systematic political use of the offices. The presence of New York and Pennsylvania politcians in Jackson's cabinet taught him to use the same system Removals, except for cause, had been relatively rare before; but under Jackson men were removed almost exclusively for party purposes and a clean sweep was made in the civil service. Other parties adopted the system, and it remained the rule at a change of administration until near the end of the century.

Parties.—The system brought with it a semi-military reorganization of parties. Hitherto nominations for the more important offices had been made mainly by legislative caucuses; candidates for president and vice-president were nominated by caucuses of congressmen, and candidates for the higher State offices by caucuses of the State legislatures. Late in the preceding period "conventions" of delegates from the members of the party in the State were held in New York and Pennsylvania; and in 1831–32 this became the rule for presidential nominations. It rapidly developed into systematic State, county and city "conventions"; and the result was the appearance of that complete political machnery, the American political party The Democratic machinery was the first to appear, in Jackson's second term (1833–37). Its workers were paid in offices, or hopes of office, so that it was said to be built on the "cohesive power of public plunder"; but its success was immediate and brilliant. The opposing party, the Whig Party, had no chance of victory in 1836; and its complete overthrow drove its leaders into the organization of a simllar machinery of their own, which scored its first success in 1840.

Bank of the U.S.—The Bank of the United States had hardly been heard of in politics until the new Democratic organization came into hostile contact with it. A semi-official demand upon it for a political appointment was met by a refusal; and the party managers called Jackson's attention to an institution which he could not but dislike the more he considered it. His first message spoke of it in unfriendly terms, and every succeeding message brought a more open attack. The old party of Adams and Clay had by this time taken the name of Whigs, probably from the notion that they were struggling against "the reign of Andrew Jackson," and they adopted the cause of the bank with eagerness The bank charter did not expire until 1836, but in 1832 Clay brought up a bill for a new charter. It was passed and vetoed; and the Whigs made the veto an important issue of the presidential election of that year. They were beaten; Jackson was re-elected, receiving 219 electoral votes, and Clay, his Whig opponent, only 49, and the bank party could never again get a majority in the House of Representatives. But the President could not obtain a majority in the Senate. He determned to take a step which would give him an initiative, and which his opponents could not induce both houses to unite in overriding or punishing. Taking advantage of the provision that the secretary of the Treasury might order the public funds to be deposited elsewhere than in the bank or its branches, he directed the secretary to deposit *all* the public funds elsewhere. Thus deprived of its great source of dividends, the bank fell into difficultues, became a State bank after 1836, and then went into bankruptcy.

All the political conflicts of Jackson's terms of office were close and bitter. Loose in his ideas before 1829, Jackson showed a steady tendency to adopt the strictest construction of the powers of the Federal Government, except in such official perquisites as the offices. He grew into strong opposition to all traces of the "American system," and vetoed bills for internal improvements unsparingly; his feeling of dislike to all forms of protection is as evident, though he took more care not to make it too public.

Nullification. Calhoun and Jackson.—Calhoun and Jackson were of the same stock—Scottish-Irish—much alike in appearance and characteristics, Calhoun representing the trained and educated logic of the race, Jackson its instincts and passions. Jackson was led to break off his friendly relations with Calhoun in 1830, and he had been led to do so more easily because of the appearance of the doctrine of nullification which was generally attributed, correctly enough, to Calhoun Asserting, as the Republican Party of 1798 had done, the sovereign powers of each State, Calhoun held that, as a means of avoiding secession and violent struggle upon every occasion of the passage of an act of Congress which should seem unconstitutional to any State, the State might properly suspend or "nullify" the operation of the law within its jurisdiction The passage of the tariff act of 1832, which organized and systematized the protective system, forced his party into action. A State convention in South Carolina on Nov. 24, 1832, declared the tariff act null, and made ready to enforce the declaration

But the time was past when the power of a single State could withdraw it from the Union. The President issued a proclamation, warning the people of South Carolina against any attempt to carry out the ordinance of nullification; he ordered a naval force to take possession of Charleston Harbour to collect the duties under the act; he called upon Congress for additional executive powers, and Congress passed what nullifiers called the "bloody bill," putting the land and naval forces at the disposal of the president, and he is said to have announced, privately and profanely, his intention of making Calhoun the first victim of any open conflict. Affairs looked so threatening that an unofficial meeting of "leading nullifiers" agreed to suspend the operation of the ordinance until Congress should adjourn, whence it derived the right to suspend has never been stated.

Tariff of 1833.—The President had already asked Congress to reduce the duties; and many Democratic members of Congress, who had yielded to the popular clamour for protection, were very glad to use "the crisis" as an excuse for now voting against it. A compromise tariff act, scaling down all duties over 20% by one-tenth of the excess every two years until 1842, when the remaining excess over 20% should be dropped, was introduced by Clay and became law. Calhoun and his followers claimed this as all that the nullification ordinance had aimed at; and the ordinance was formally repealed But nullification had received its death-blow, even those southern leaders who maintained the right of secession refused to recognize the right of a State to remain in the Union while nullifying its laws.

Railways.—All the internal conditions of the United States were completely altered by the introduction of railways. For 20

years past the Americans had been pushing in every direction which offered a hope of the means of reconciling vast territory with enormous population. Stephenson's invention of the locomotive came just in time, and Jackson's two terms of office marked the outburst of modern American life. The miles of railway were 23 in 1830, 1,098 in 1835, some 2,800 in 1840, and thereafter they about doubled every five years until 1860

A railway map of 1840 shows a fragmentary system, designed mainly to fill the gaps left by the means of communication in use in 1830. One or two short lines run back into the country from Savannah and Charleston; another runs north along the coast from Wilmington to Baltimore; several lines connect New York with Washington and other points; and short lines elsewhere mark the openings which needed to be filled at once—a number in New England and the Middle States, three in Ohio and Michigan, and three in Louisiana Year after year new inventions came in to increase and aid this development. The anthracite coal of the Middle States was now successfully applied to railways (1836), and to the manufacture of iron (1837) Steam navigation across the Atlantic was established in 1838. The telegraph came next, S F B Morse's line being erected in 1844. No similar period in American history of the 19th century is so extraordinary for material development as the decade 1830–40. At its beginning the country was an overgrown type of colonial life; at its end American life had been shifted to entirely new lines, which it has since followed

Western Settlements.—The steamboat had aided western development, but the railway aided it far more. The steamboat influenced the railway, and the railway gave the steamboat new powers. Vacant places in the States east of the Mississippi were filling up; the long lines of emigrant wagons gave way to the new and better methods of transport. Chicago was but a frontier fort in 1832; within a half-dozen years it was a flourishing town, with eight steamers connecting it with Buffalo, with dawning ideas of its future development of railway connections. Two new States, Arkansas and Michigan, were admitted (1836 and 1837) The population of Ohio grew from 900,000 to 1,500,000, that of Michigan from 32,000 to 212,000, and that of the country from 13,000,000 to 17,000,000, between 1830 and 1840.

Social Conditions.—With the change of material surroundings and possibilities came a steady amelioration of social conditions and a development of social ideals. Such features of the past as imprisonment for debt and the cruel indifference of old methods of dealing with crime began to disappear, the time was past when a State could use an abandoned copper mine as its State prison, as Connecticut had formerly done. The domestic use of gas and anthracite coal, the introduction of expensive aqueducts for pure water, and the changing life of the people forced changes in the interior and exterior of American dwellings. Wood was still the common building material; imitations of Greek architecture still retained their vogue; but the interiors were models of comfort in comparison with the houses even of 1810 In the "new" regions this was not yet the case, and here social restraints were still so few that society seemed to be reduced almost to its primitive elements Western steamers reeked with gambling, swindling, duelling and every variety of vice. Public law was almost suspended in some regions; and organized associations of counterfeiters and horse-thieves terrorized whole sections of the country. But this state of affairs was altogether temporary, as well as limited in its area; the older and more densely settled States had been well prepared for the change and had never lost command of the social forces, and the process of settling down went on, even in the newer States, with far more rapidity than could have been expected.

Literature.—A distinct American literature dates from this period. Most of the publications in the United States were still cheap reprints of foreign works; but native productions no longer followed foreign models with servility. Between 1830 and 1840 Whittier, Longfellow, Holmes, Poe, Hawthorne, Emerson, Bancroft and Prescott joined the advance-guard of American writers —Bryant, Dana, Halleck, Drake, Irving and Cooper; and even those writers who had already made their place in literature showed the influence of new conditions by their growing tendency to look less to foreign models and methods. Popular education was improved The new States had from the first endeavoured to secure the best possible system of common schools The attempt came naturally from the political instincts of the class from which the migration came; but the system which resulted was to be of incalculable service during the years to come. Their absolute democracy and their universal use of the English language have made the common schools most successful machines for converting the raw material of immigration into American citizens This supreme benefit is the basis of the system and the reason for its existence and development, but its incidental advantage of educating the people has been beyond calculation. It was an odd symptom of the general change that American newspapers took a new form during these ten years. The old "blanket-sheet" newspaper, cumbrous to handle and slow in all its ways, met its first rival in the type of newspaper which appeared first in New York city, in the *Sun*, the *Herald* and the *Tribune* (1833, 1835 and 1841). Swift and energetic in gathering news, and fearless, sometimes reckless, in stating it, they burst into American life, with very much that is evil, a great preponderance of good

Speculation.—The chaos into which a part of American society had been thrown had a marked effect on the financial institutions of the country, which went to pieces before it for a time. It had not been meant to make the public lands of the United States a source of revenue so much as a source of development. The sales had touched their high-water mark during the speculative year 1819, when receipts from them had amounted to $3,274,000; in other years they seldom went above $2,000,000 When the railway set the stream of migration moving faster than ever, and cities began to grow like mushrooms, it was natural that speculation in land should feel the effects. Sales rose to $3,200,000 in 1831, and to $25,000,000 in 1836. In 1835 the President announced to Congress that the public debt was extinguished, and that some way of dealing with the surplus should be found. Calhoun's proposal, that after the year 1836 any surplus in excess of $5,000,000 should be divided among the States as a loan, was adopted, as regards the surplus (almost $37,000,000) of that year; and some $28,000,000 were actually distributed before the crisis of 1837 put an end to the surplus and to the policy The States had already taken a hand in the general speculation by beginning works of public improvement. Foreign, particularly English, capital was abundant; and States which had been accustomed to think a dozen times over a tax of $100,000 now began to negotiate loans of millions of dollars and to appropriate the proceeds to the digging of canals and the construction of railways. Their enterprises were badly conceived and badly managed. The imaginations of individuals ran riot. Every one wanted to buy; prices rose, and every one was growing richer on paper. The assessed value of real estate in New York city in 1832 was $104,000,000; in 1836 it had grown to $253,000,000. In Mobile the assessed value rose from $1,000,000 to $27,000,000.

When Jackson in 1833 ordered the Government revenues to be deposited elsewhere than in the Bank of the United States, there was no Government agent to receive them The secretary of the Treasury selected banks at various points in which the revenue should be deposited by the collecting officers, but these banks were organized under charters from their States. The Democratic feeling was that the privilege of forming banking corporations should be open to all citizens, and it soon became so. Moreover, it was not until after the crash that New York began the system of compelling such deposits as would really secure circulation. In most of the States banks could be freely organized with or without tangible capital, and their notes could be sent to the West for the purchase of Government lands, which needed to be held but a month or two to gain a handsome profit. "Wild-cat banks" sprang up all over the country; and the "pet banks," as those chosen for the deposit of Government revenues were called, went into speculation as eagerly as the banks which hardly pretended to have capital.

Panic of 1837.—The Democratic theory denied the power of Congress to make anything but gold or silver coin legal tender. There have been "paper-money heresies" in the party; but there was none such among the new school of Democratic leaders which came in in 1829; they were "hard-money men." In July 1836

Jackson's secretary of the Treasury ordered land agents to take nothing in payment for lands except gold or silver In the following spring the full effects of the order became evident; they fell on the administration of Van Buren, Jackson's successor Van Buren had been Jackson's secretary of State, the representative man of the new Democratic school, and it seemed to the Whigs poetic justice that he should bear the weight of his predecessor's errors The "specie circular" turned the tide of paper back to the East, and when it was presented for payment most of the banks suspended specie payment There was no longer a thought of buying; everyone wanted to sell, and prices ran down with a rapidity even more startling than that with which they had risen Failures on a scale unprecedented in the United States made up the "panic of 1837" Many of the States had left their bonds in the hands of their agents, and, on the failure of the agents, found that the bonds had been hypothecated or disposed of, so that the States got no return from them except a debt which was to them enormous. Saddled suddenly with such a burden, and unable even to pay interest, some of the States "repudiated" their obligations; and repudiation was made successful by the fact that a State could not be sued except by its own consent. Even the U S Government felt the strain, for its revenues were locked up in suspended banks. A little more than a year after Congress had authorized the distribution of its surplus revenues among the States, Van Buren was forced to call it into special session to provide some relief for the Government itself.

The Sub-treasury.—Van Buren held manfully to the strictest construction of the powers of the Federal Government. He insisted that the panic would best right itself without Government interference, and, after a four years' struggle, he succeeded in making the "sub-treasury scheme" law (1840) It cut off all connection of the Government with banks, putting collecting and disbursing officers under bonds to hold money safely and to transfer it under orders from the Treasury, and restricting payments to or by the United States to gold and silver coin Its passage had been preceded by another commercial crisis (1839), more limited in its field, but more discouraging to the people

Election of 1840.—Van Buren's firmness was unpopular, and the Whig Party now adopted methods which were popular if somewhat demagogical. It nominated William H Harrison in 1840, it contrasted his homely frontier virtues with Van Buren's "ostentatious indifference to the misfortunes of the people" and after the first of the modern "campaigns" of mass meetings and processions Harrison was elected, receiving 234 electoral votes and Van Buren only 60. He died only a month after his inauguration, and the vice-president, John Tyler, became President.

Tyler was of the extreme Calhoun school, which had shown some disposition to grant to Van Buren a support which it had refused to Jackson; and the Whigs had nominated Tyler to retain his faction with them. Now he was the nominal leader of the party, while his politics were opposite to theirs, and the real leader of the party, Clay, was ready to force a quarrel upon him. The quarrel took place; the Whig majority in Congress was not large enough to pass any measures over Tyler's veto; and the first two years of his administration were passed in barren conflict with his party The "sub-treasury" law was repealed (1841); the tariff of 1842 introduced a modified protection; and there the Whigs were forced to stop. Their dissensions made Democratic success comparatively easy. The success of the Democratic machinery, and the reflex of its temporary check in 1840, with the influences brought to bear on it by the returning Calhoun faction, were such as to take the control of the party out of the hands of the leaders who had formed it. They had had high regard for political principle, even though they were willing to use doubtful methods for its propagation; these methods had now brought out new men, who looked mainly to success, and to close connection with the controlling political element of the South as the easiest means of attaining success. When the Democratic convention of 1844 met it was expected to renominate Van Buren, but James K. Polk was nominated. The Whigs nominated Clay.

Abolitionist Movement.—The beginning of the abolitionist movement in the United States, the establishment of the *Liberator* (1831), and of the American Anti-slavery Society (1833), and the subsequent divisions in it, are dealt with elsewhere (*see* GARRISON, WILLIAM LLOYD) Up to that time "abolition" had meant *gradual* abolition, Garrison called for *immediate* abolition The basis of the American system was in the reserved rights of the States, and slavery rested on their will. The mission of the Abolitionists was to force the people to think of the question; and, in spite of riots, assaults and persecution of every kind, they fulfilled it manfully. In truth, slavery was more and more out of harmony with the new economic conditions which were taking complete control of the North and West, but had hardly been felt in the South Thus the two sections, North and South, were more and more disposed to take opposite views of everything in which slavery was involved, and it had a faculty of involving itself in almost everything The status of slavery in the Territories had been settled in 1820; that of slavery in the States had been settled by the Constitution; but even in minor questions the intrusive element had to be reckoned with The Abolitionists sent their documents through the mails, and the South wished the Federal Government to stop the practice. The Abolitionists persisted in petitioning Congress for the passage of various measures which Congress regarded as utterly unconstitutional, and the disposition of Congress to deny or regulate the right of petition in such matters excited the indignation of Northern men who had no sympathy with abolition. But the first occasion on which the views of the two sections came into flat contrast was on the question of the annexation of Texas.

Texas and Oregon.—The United States had had a vague claim to Texas until 1819, when the claim was surrendered to Spain in part compensation for Florida. On the revolt of Mexico, Texas became a part of that republic. It was colonized by Americans, mainly southerners and slave-holders, seceded from Mexico in 1835, and defeated the Mexican armies and established its independence in the following year. Southern politicians desired its annexation to the United States. People in the North were either indifferent or hostile to the proposal; Van Buren had declared against it, and his action was a reason for his defeat in the Democratic convention. On the other hand, there were indications that the joint occupation of the Oregon country could not last much longer American immigration into it had begun, while the Hudson's Bay Company, the British tenant of the soil was the natural enemy of immigration The two points were coupled; and the Democratic convention declared for the reannexation of Texas and the reoccupation of Oregon.

Election of 1844.—One of the cardinal methods of the political Abolitionists was to nominate candidates of their own against a doubtful friend, even though this secured the election of an open enemy. Clay's efforts to guard his condemnation of the Texas annexation project were just enough to push the Liberty party, the political Abolitionists, into voting for candidates of their own in New York; on a close vote their loss was enough to throw the electoral votes of that State to Polk, and its votes decided the result. Polk was elected (Nov. 1844); and Texas was annexed to the United States in the following spring. At the next meeting of Congress (1845) Texas was admitted as a State.

West of Texas the northern prolongation of Mexico ran right athwart the westward movement of American population; and though the movement had not yet reached the barrier the Polk Administration desired further acquisitions from Mexico. The western boundary of Texas was undefined; a strip of territory claimed by Texas was settled exclusively by Mexicans; but the Polk Administration directed Gen. Zachary Taylor, the American commander in Texas, to cross the Nueces river and seize the disputed territory Collisions with Mexican troops followed; they were beaten in the battles of Palo Alto and Resaca de la Palma, and were chased across the Rio Grande. Taylor followed and took the city of Monterrey.

War with Mexico.—On the news of the first bloodshed, Congress declared war against Mexico, over the opposition of the Whigs A land and naval force took possession of California, and a land expedition occupied New Mexico, so that the authority of Mexico over all the soil north of her present boundaries was

abruptly terminated (1846). At the opening of 1847 Taylor fought the last battle in northern Mexico (Buena Vista), defeating the Mexicans, and Gen Winfield Scott, with a new army, landed at Vera Cruz for a march upon the City of Mexico. Scott's march was marked by one successful battle after another, usually against heavy odds; and in September he took the capital city and held it until peace was made (1848) by the Treaty of Guadalupe Hidalgo. Among the terms of peace was the cession of the present California, Utah, Arizona and New Mexico, the consideration being a payment of $15,000,000 by the United States and the assumption of some $3,000,000 of debts due by Mexico to American citizens. With a subsequent rectification of frontier (1853) by the Gadsden Treaty (*see* GADSDEN, JAMES), this cession added some 500,000sq m to the area of the United States; Texas itself made up a large additional area. The settlement of the north-east and north-west boundaries by the Webster-Ashburton and Buchanan-Pakenham treaties (1842, 1846) with the Texas and Mexican cessions, gave the United States the complete territorial form retained until the annexation of Alaska in 1867.

Slavery in the New Territory.—In the new territory slavery had been forbidden under Mexican law; and its annexation brought up the question of its status under American law. If slavery was to be excluded from the new territory, the States which should ultimately be formed out of it would enter as free States, and the influence of the South in the Senate would be decreased For the first time the South appears as a distinct *imperium in imperio*.

"Squatter Sovereignty."—The first appearance of these difficulties brought out in the Democratic Party a solution which was so closely in line with the prejudices of the party that it bade fair to carry the party through the crisis without the loss of its Southern vote. This was "squatter sovereignty," the notion that it would be best for Congress to leave the people of each Territory to settle the question of the existence of slavery for themselves. The broader and democratic ground for the party would have been that which it at first seemed likely to take—the "Wilmot Proviso," a condition proposed to be added to the act authorizing acquisitions of territory, providing that slavery should be forbidden in all territory to be acquired under the act. In the end apparent expediency carried the dominant party off to "squatter sovereignty," and the Democratic adherents of the Wilmot Proviso, with the Liberty Party and the anti-slavery Whigs, united in 1848 under the name of the Free Soil Party. The Whigs had no solution to offer; their entire programme consisted in a persistent effort to evade or ignore all difficulties connected with slavery.

Election of 1848.—Taylor, after the battle of Buena Vista, resigned and came home, considering himself ill-used by the Administration. He refused to commit himself to any party; and the Whigs were forced to accept him as their candidate in 1848. The Democrats nominated Lewis Cass; the "Free-Soilers" nominated Van Buren. Taylor was elected President, receiving 163 electoral votes, while Cass received 127. Taking office in March 1849, he had on his shoulders the whole burden of the territorial difficulties, aggravated by the discovery of gold in California and the sudden rise of population there. Congress was so split into factions that it could for a long time agree upon nothing; and the Californians, with the approval of the President, proceeded to form a Constitution and apply for admission as a State. They had so framed their Constitution as to forbid slavery; and this was really the application of the Wilmot Proviso to the richest part of the new territory, and the South felt that it had been robbed of the cream of what it alone had fought cheerfully to obtain.

Compromise of 1850.—The admission of California was not secured until Sept. 1850, soon after Taylor's sudden death (July 9), and then only by the addition of a bonus to Texas, the division of the rest of the Mexican cession into the Territories of Utah and New Mexico without prohibition of slavery, and the passage of a fugitive slave law. The slave trade, but not slavery, was forbidden in the District of Columbia. The whole was generally known as the Compromise Measures of 1850. Two of its features need notice As has been said, slavery was not mentioned in the act; and the status of slavery in the Territories was thus left uncertain. Congress can veto any legislation of a Territorial legislature but, in fact, the two houses of Congress were hardly ever able to unite on anything after 1850, and both these Territories did establish slavery before 1860, without a congressional veto. The advantage here was with the South. The other point, the fugitive slave law was a special demand of the South. The Constitution contained clauses directing that fugitive criminals and slaves should be delivered up, on requisition, by the State to which they had fled. In the case of criminals the delivery was directed to be made by the executive of the State to which they had fled; in the case of slaves no delivering authority was specified, and an act of Congress in 1793 had imposed the duty on Federal judges or on local State magistrates. Some of the States had passed "personal liberty laws," forbidding or limiting the action of their magistrates in such cases, and the act of 1850 transferred the decision of such cases to United States commissioners, with the assistance of United States marshals.

Tariff of 1846.—The question of slavery had taken up so much time in Congress that its other legislation was comparatively limited. The rates of postage were reduced to five and ten cents for distances less and greater than 300m. (1845); and the naval school at Annapolis was established in the same year. The military academy at West Point had been established as such in 1802. When the Democratic Party had obtained complete control of the Government, it re-established (by act of Aug 6, 1846), the "subtreasury," or independent Treasury. In the same year, a tariff bill was passed; it reduced duties, and moderated the application of the protective principle Apart from a slight reduction of duties in 1857, this remained in force till 1861.

New States.—Five States were admitted during the last ten years of this period: Florida (1845), Texas (1845), Iowa (1846), Wisconsin (1848) and California (1850). The early entrance of Iowa, Wisconsin and Florida had been due largely to Indian wars, after each of which the defeated Indians were compelled to cede lands The extinction of Indian titles in northern Michigan brought about the discovery of the great copper fields of that region. Elsewhere settlement followed the lines already marked out, except in the new possessions on the Pacific coast, whose full possibilities were not yet known Railways in the Eastern States were beginning to show something of a connected system; in the South they had hardly changed since 1840; in the West they had been prolonged only on their original lines. The telegraph was brought into use in 1844; but it was not until the census of 1860 that its effects were seen in the fully connected network of railways which then covered the whole North and West.

Invention.—The sudden development of wealth in the country gave an impetus to the spirit of invention. Charles Goodyear's method of vulcanizing rubber (1839) had come into use Cyrus Hall McCormick had made an invention the results of which have been hardly less than that of the locomotive in their importance to the United States He had patented a reaping machine in 1834, and this, further improved and supplemented by other inventions, had brought into play the whole system of agricultural machinery A successful sewing-machine came in 1846; the power-loom and the surgical use of anaesthetics in the same year; and the rotary press for printing in 1847.

The Mormons.—All the conditions of life were changing so rapidly it was natural that the minds of men should change with them. This was the era of new sects, of communities, of transcendentalism in literature, religion and politics. The most successful of these was the sect of Mormons. They settled in Utah in 1847, calling their capital Salt Lake City, and spread through the neighbouring Territories. They became a menace to the American system; their numbers were so great that it was against American instincts to deprive them of self-government; while their polygamy and total submission to their hierarchy made it impossible to erect them into a State having complete control of marriage and divorce. The difficulty was lessened by their renunciation of polygamy in 1890.

The South.—The material development of the United States since 1830 had been extraordinary, but every year made it more evident that the South was not sharing in it. It is plain now that

the fault was in her labour system. her only labourers were slaves, and a slave who was fit for anything better than field labour was *prima facie* a dangerous man The divergence had as yet gone only far enough to awaken intelligent men in the South to its existence, and to stir them to efforts as hopeless as they were earnest, to find some artificial stimulus for Southern industries. In the next ten years the process was to show its effects on the national field

Slavery had put the South out of harmony with its surroundings Even in 1850, though they hardly yet were aware of it, the two sections had drifted so far apart that they were practically two different countries.

The Slave Power.—The South remained much as in 1790, while other parts of the country had developed, it had stood still. The remnants of colonial feeling, of class influence, which advancing democracy had wiped out elsewhere, retained their force here. The ruling class had to maintain a military control over the labouring class, and a class influence over the poorer whites. It had even secured in the Constitution provision for its political power in the representation given to three-fifths of the slaves. The 20 additional members of the House of Representatives were not simply a gain to the South; they were still more a gain to the "black districts," where whites were few, and the slave-holder controlled the district. Slave-owners and slave-holders together, there were but 350,000 of them; but they had common interests, the intelligence to see them, and the courage to contend for them The first step of a rising man was to buy slaves; and this was enough to enroll him in the dominant class. From it were drawn the representatives and senators in Congress, the governors and all the holders of offices over which the "slave power," as it came to be called, had control.

Immigration.—Immigration into the United States was not an important factor in its development till about 1847. The immigrants, so late as 1820, numbered but 8,000 per annum; their number did not touch 100,000 till 1842, and then it fell for a year or two almost to half that number. In 1847 it rose again to 235,000, in 1849 to 300,000, and in 1850 to 428,000, all told, more than 2,225,000 persons from abroad settled in the United States between 1847 and 1854. Leaving out the dregs of the immigration, which settled down in the seaboard cities, its best part was a powerful nationalizing force. It had not come to any particular State, but to the United States, yet all the influences of this enormous immigration were confined to the North and West; the immigration avoided slave soil as if by instinct And as the sections began to differ further in aims and policy the North began to gain heavily in ability to ensure its success.

Congress.—Texas was the last slave State ever admitted; and, as it refused to be divided, the South had no further increase of numbers in the Senate. Until 1850 the admission of a free State had been so promptly balanced by the admission of a slave State that the senators of the two sections had remained about equal in number: in 1860 the free States had 36 senators and the slave States only 30. As the representation in the House had changed from 35 free State and 30 slave State members in 1790 to 147 free State and 90 slave State in 1860, and as the number of presidential electors is the sum of the numbers of senators and representatives, political power had passed away from the South in 1850. If at any time the free States should unite they would be supreme.

Tendencies to Disunion.—In circumstances so critical a cautious quiescence and avoidance of public attention was the only safe course for the "slave power," but that course had become impossible. The numbers interested had become too large to be subject to complete discipline; not all could be held in cautious reserve; and when an advanced proposal came from any quarter of the slave-holding lines the whole army was shortly forced up to the advanced position. If collision came it must be on some question of the rights of the States; and on such a question the whole South would move as one man.

The Protestant churches of the United States had reflected in their organization the spirit of the political institutions under which they lived. Acting as purely voluntary associations, they had been organized into governments by delegates, much like the "conventions" which had been evolved in the political parties The omnipresent slavery question intruded into these bodies, and split them Only the Episcopal and Roman Catholic Churches retained their national character

Party Changes.—The political parties showed the same tendency. Each began to shrivel up in one section or the other The notion of "squatter sovereignty," attractive at first to the Western democracy, and not repudiated by the South, enabled the Democratic Party to pass the crisis of 1850 without losing much of its Northern vote, while Southern Whigs began to drift in, making the party continually more pro-slavery. This could not continue long without beginning to decrease its Northern vote, but this effect did not become plainly visible until after 1852. The efforts of the Whig Party to ignore the great question alienated its anti-slavery members in the North, while they did not satisfy its Southern members The Whig losses were not at first heavy, but, as the electoral vote of each State is determined by the barest plurality they were enough to defeat the party almost everywhere in the presidential election of 1852 The Whigs nominated Gen Winfield Scott and the Democrats Franklin Pierce; Pierce carried all but four of the 31 States, and was elected, receiving 254 out of the 296 electoral votes. This revelation of hopeless weakness was the downfall of the Whig Party; it maintained its organization for four years longer, but the life had gone out of it. The future was with the Free Soil Party, though it had polled but few votes in 1852.

During the Administration of Taylor (and vice-president Millard Fillmore, who succeeded him) Clay, Webster, Calhoun, Polk and Taylor were removed by death, and there was a steady drift of other political leaders out of public life New men were pushing in everywhere, and in both sections they showed the prevailing tendency to disunion The best of them were unprecedentedly radical. Charles Sumner, William H Seward and Salmon P. Chase came into the Senate, bringing the first accession of recognized force and ability to the anti-slavery feeling in that body. The new Southern men, such as Jefferson Davis, and the Democratic recruits from the Southern Whig Party, such as Alexander H Stephens, were ready to take the ground on which Calhoun had always insisted—that Congress was bound not merely to the negative duty of not attacking slavery in the Territories, but to the positive duty of protecting it. This, if it should become the general Southern position, was certain to destroy the notion of "squatter sovereignty," and thus to split the Democratic Party, which was almost the last national ligament that now held the two fragments of the Union together.

Progress of Disunion.—The social disintegration was as rapid. Northern men travelling in the South were naturally looked upon with increasing suspicion, and were made to feel that they were on a soil alien in sympathies Some of the worst phases of democracy were called into play in the South; and, in some sections, law openly yielded supremacy to popular passion in the cases of suspected Abolitionists. Southern conventions, on all sorts of subjects, became common; and, permeated by a dawning sense of Southern nationality, hardly any proposition looking to Southern independence of the North was met with disfavour.

Calhoun, in his last and greatest speech, called attention to the manner in which one tie after another was snapping But he ignored the real peril of the situation—its dangerous facts: that the South was steadily growing weaker in comparison with the North, and more unable to secure a wider area for the slave system; that it was therefore being steadily forced into demanding active Congressional protection for slavery in the Territories; that the North would never submit to this; and that the South must submit or bring about a collision by attempting to secede.

Kansas-Nebraska Act.—Anti-slavery feeling in the North was stimulated by the manner in which the fugitive slave law was enforced immediately after 1850. The chase after fugitive slaves was prosecuted in many cases with circumstances of revolting brutality The added feeling showed its force when the Kansas-Nebraska Act was passed by Congress (1854). It organized the two new Territories of Kansas and Nebraska. Both of them were

forever free soil by the terms of the Missouri Compromise But the success of the notion of squatter sovereignty in holding the Democratic Party together while destroying the Whig Party had intoxicated Stephen A Douglas and other Northern Democrats, and they now applied the doctrine to these Territories Thus did not desire "to vote slavery up or down," but left the decision to the people of the two Territories

The Republican Party.—The Kansas-Nebraska Act was the grossest political blunder in American history. The status of slavery had been settled, by the Constitution or by the compromises of 1820 and 1850, on every square foot of American soil; right or wrong, the settlement was made. The new act took a great mass of territory out of the settlement and flung it down as a prize for which the sections were to struggle. The first result of the act was to throw parties into chaos. An American or "Know-Nothing" Party, a secret oath-bound organization, pledged to oppose the influence or power of foreign-born citizens, had been formed to take the place of the defunct Whig Party It had been quite successful in State elections for a time, and was now beginning to have larger aspirations. It like the Whig Party, intended to ignore slavery, but, after a few years of life, the questions complicated with slavery divided it also. Even in 1854 many of its leaders in the North were forced to take position against the Kansas-Nebraska Act, while hosts of others joined in the opposition without any party organization. No American party ever rose so swiftly as this; with no other party name than the awkward title of "Anti-Nebraska men," it carried the congressional elections of 1854 in the North, forced many of the former Know-Nothing leaders into union with it, and controlled the House of Representatives of the Congress which met in 1855. The Democratic Party, which had been practically the only party since 1852, had now to face the latest and strongest of its broad-constructionist opponents. It acknowledged, at first. no purpose aimed at slavery, only an intention to exclude slavery from the Territories, but, under such principles, it was the only party which was potentially an anti-slavery party. The new party had grasped the function which belonged of right to its great opponent, and it seized with it its opponent's original title. The name Democrat had quite taken the place of that first used—Republican—but Republican had never passed out of popular remembrance and liking in the North The new party took quick and skilful advantage of this by assuming the old name, and early in 1856 the two great parties of the present—Democratic and Republican—were drawn up against one another.

Foreign Relations.—The foreign relations during Pierce's term of office were overshadowed by the domestic difficulties, but were of importance. In the Koszta case (1853) national protection had been afforded on foreign soil to a person who had taken only the preliminary steps to naturalization Japan had been opened to American intercourse and commerce (1854). But the question of slavery was more and more thrusting itself even into foreign relations A great Southern republic, to be founded at first by the slave States, but to take in gradually the whole territory around the Gulf of Mexico and include the West Indies, was soon to be a pretty general ambition among slave-holders, and its first phases appeared during Pierce's administration Efforts were begun to obtain Cuba from Spain; and the three leading American ministers abroad, meeting at Ostend, united in declaring the possession of Cuba to be essential to the well-being of the United States (1854). "Filibustering" expeditions against Cuba or the smaller South American States, intended so to revolutionize them as to lay a basis for an application to be annexed to the United States, became common. But these yielded in importance to the affairs in Kansas.

Kansas.—Nebraska was then supposed to be a desert, and attention was directed almost exclusively to Kansas. No sooner had its organization left the matter of slavery to be decided by its "people" than the anti-slavery people of the North and West felt it to be their duty to see that the "people" of the Territory should be anti-slavery in sympathy. Emigrant associations were formed, and these shipped men and families to Kansas, arming them for their protection in the new country. Southern newspapers called for similar measures in the South, but the call was less effective Southern men without slaves, settling a new State, were uncomfortably apt to prohibit slavery, as in California. Only slave-holders were trusty pro-slavery men, and such were not likely to take slaves to Kansas and risk their ownership But for the people of Missouri, Kansas would have been free soil at once. Lying across the direct road to Kansas, the Missouri settlers blockaded the way of free-State settlers, crossed into Kansas, and voted profusely at the first Territorial election. The struggle passed into a real civil war, the two powers fighting battles, capturing towns and paroling prisoners The struggle was really over in 1857, and the South was beaten. There were, however, many obstacles yet to be overcome before the new State of Kansas was recognized by Congress, after the withdrawal of the senators of the seceding States (1861).

Election of 1856.—In the heat of the Kansas struggle came the presidential election of 1856. The Democrats nominated James Buchanan, declaring, as usual, for the strictest limitations of the powers of the Federal Government and reaffirming the principle of the Kansas-Nebraska act—the settlement of slavery by the people of a Territory. The remnant of the Whig Party, including the Know-Nothings of the North and those Southern men who wished no further discussion of slavery, nominated Millard Fillmore The Republican Party nominated John C. Frémont; the bulk of its manifesto was taken up with protests against attempts to introduce slavery into the Territories; but it showed its broad-construction tendencies by declaring for appropriations of Federal moneys for internal improvements. The Democrats were successful in electing Buchanan; but the position of the party was quite different from the triumph with which it had come out of the election of 1852 It was no longer master of 27 of the 31 States, all the free States but five had gone against it; its candidate no longer had a majority of the popular vote. For the first time in the history of the country a distinctly anti-slavery candidate had obtained an electoral vote, and had even come near obtaining the Presidency Fillmore had carried but one State, Maryland; Buchanan had carried the rest of the South, with a few States in the North, and Frémont the rest of the North and none of the South.

Dred Scott.—Oddly enough the constitutionality of the Compromise of 1820 had never happened to come before the Supreme Court for consideration. In 1856-57 it came up for the first time. One Dred Scott, a Missouri slave who had been taken in 1834 to Illinois, a free State, and in 1836 to Minnesota, within the territory covered by the compromise, and had some years after being taken back to Missouri in 1838 sued for his freedom, was sold (1852) to a citizen of New York. Scott then transferred his suit from the State to the Federal courts, under the power given them to try suits between citizens of different States, and the case came by appeal to the Supreme Court. Its decision, announced on March 6, 1857, put Scott out of court on the ground that a slave, or the descendant of slaves, could not be a citizen of the United States or have any standing in Federal courts The opinion of Chief Justice Taney went on to attack the validity of the Missouri Compromise, for the reasons that one of the Constitutional functions of Congress was the protection of property, that slaves had been recognized as property by the Constitution, and that Congress was bound to protect, not to prohibit, slavery in the Territories Most of the Northern people held that slaves were looked upon by the Constitution not as property but as "persons held to service or labour" by State laws. A large part of the North flouted the decision of the Supreme Court, and the storm of angry dissent which it aroused did the disunionists good service in the South From this time the leading newspapers in the South maintained that the radical Southern view first advanced by Calhoun, and but slowly accepted by other Southern leaders, as to the duty of Congress to protect slavery in the Territories, had been confirmed by the Supreme Court; that the Northern Republicans had rejected it; even the "squatter sovereignty" of Northern Democrats could no longer be submitted to by the South

John Brown.—The population of the United States in 1860

was over 31,000,000, an increase of more than 8,000,000 in ten years As the decennial increases of population became larger, so did the divergence of the sections in population, and still more in wealth and resources Two more free States came in during this period—Minnesota (1858) and Oregon (1859)—and Kansas was clamouring loudly for the same privilege The free and slave States, which had been almost equal in population in 1790, stood now as 19 to 12 And of the 12,000,000 in slave States, the 4,000,000 slaves and the 250,000 free blacks were not so much a factor of strength as a possible source of weakness and danger No serious slave rising had ever taken place in the South, but John Brown's attack (1859) on Harper's Ferry, as the first move in a project to rouse the slaves and the alarm which it carried through the South, were tokens of a danger which added a new horror to the chances of civil war.

Democratic Party Split.—Northern Democrats, under the lead of Douglas, had been forced already almost to the point of revolt by the determination of Southern senators to prevent the admission of Kansas as a free State, if not to secure her admission as a slave State. When the Democratic convention of 1860 met at Charleston the last strand of the last national political organization parted; the Democratic Party itself was split by the slavery question. The Southern delegates demanded a declaration in favour of the duty of Congress to protect slavery in the Territories. It was all that the Douglas Democrats could then do to maintain themselves in a few Northern States; such a declaration meant political suicide everywhere, and they voted it down The convention divided into two bodies. The Southern body adjourned to Richmond, and the Northern and border State convention to Baltimore Here the Northern delegates, by seating some delegates friendly to Douglas, provoked a further secession of border State delegates, who, in company with the Richmond body, nominated John C. Breckinridge and Joseph Lane for President and vice-president The remainder of the original convention nominated Douglas and H. V Johnson

The remnant of the old Whig and Know-Nothing parties, now calling itself the Constitutional Union Party, met at Baltimore and nominated John Bell and Edward Everett. The Republican convention met at Chicago. Its "platform" of 1856 had been somewhat broad-constructionist but a strong Democratic element in the party had prevented it from going too far. The election of 1856 had shown that, with the votes of Pennsylvania and Illinois, the party would have then been successful, and the Democratic element was now ready to take almost anything which would secure the votes of these States. This state of affairs will go to explain the nomination of Abraham Lincoln, of Illinois, for President, with Hannibal Hamlin, a former Democrat, for vice-president, and the declaration of the platform in favour of a protective tariff. The mass of the platform was still devoted to the necessity of excluding slavery from the Territories.

Election of 1860.—No candidate received a majority of the popular vote, Lincoln standing first and Douglas second. But Lincoln and Hamlin had a clear majority of the electoral vote, and so were elected, Breckinridge and Lane coming next. It is worthy of mention that, up to the last hours of Lincoln's first term of office, Congress would always have contained a majority opposed to him but for the absence of the members from the seceding States. The interests of the South and even of slavery were thus safe enough under an anti-slavery president. But the drift of events was too plain. Nullification had come and gone, and the nation feared it no longer Even secession by a single State was now almost out of the question; the letters of Southern governors in 1860, in consultation on the state of affairs, agree that no State would secede without assurances of support by others. If this crisis were allowed to slip by without action, even a sectional secession would soon be impossible.

Secession.—In Oct. 1860 Gov. W. H Gist of South Carolina sent a letter to the governor of each of the other cotton States except Texas, asking co-operation in case South Carolina should resolve upon secession, and the replies were favourable The democratic revolution which, since 1829, had compelled the legislature to give the choice of presidential electors to the people of the States had not affected South Carolina, her electors were still chosen by the legislature. That body, after having chosen the State's electors on Nov. 6, remained in session until the telegraph had brought assurances that Lincoln had been elected; it then (on the 10th) summoned a State convention and adjourned The State convention on Dec 20 unanimously passed an "ordinance of secession," repealing the acts by which the State had ratified the Constitution and its amendments, and dissolving "the union now subsisting between South Carolina and other states, under the name of the 'United States of America'" The convention took all steps necessary to prepare for war, and adjourned. Similar ordinances were passed by conventions in Mississippi (Jan 9, 1861), Florida (Jan 10), Alabama (Jan 11), Georgia (Jan. 19), Louisiana (Jan. 26) and Texas (Feb. 1)

The Confederate States.—The opposition in the South did not deny the right to secede, but the expediency of its exercise. Their effort was to elect delegates to the State conventions who would vote not to secede They were beaten, says A H. Stephens, by the cry, originally uttered by T. R. R. Cobb before his State legislature (Nov. 12, 1860), "We can make better terms out of the Union than in it." That is, the States were to withdraw individually, suspend the functions of the Federal government within their jurisdiction for the time, consider maturely any proposals for guarantees for their rights in the Union, and return as soon as satisfactory guarantees should be given. When the conventions of the seceding States had adopted the ordinances of secession, they proceeded to other business. They appointed delegates, who met at Montgomery, the capital of Alabama, formed a provisional Constitution (Feb 8) for the "Confederate States," chose a provisional President and vice-president (Jefferson Davis and A H Stephens), and established an Army, Treasury, and other executive departments. The president and vice-president were inaugurated on Feb. 18 The permanent Constitution, adopted on March 11, was copied from that of the United States, with variations meant to maintain state Sovereignty, to give the Cabinet seats in Congress, and to prevent the grant of bounties or any protective features in the tariff or the maintenance of internal improvements at general expense; and it expressly provided that in all the territory belonging to the Confederacy but lying without the limits of the several States "the institution of negro slavery, as it now exists in the Confederate States, shall be recognized and protected by Congress and by the Territorial Government"

Under what claim of constitutional right all this was done passes comprehension. That a State convention should have the final power of decision on the question which it was summoned to consider is quite as radical doctrine as has yet been heard of; that a State convention, summoned to consider the one question of secession, should go on, with no appeal to any further popular authority or mandate, to send delegates to meet those of other States and form a new National Government, which could only exist by warring on the United States, is a novel feature in American constitutional law. It was revolution or nothing. Only in Texas, where the call of the State convention was so irregular that a popular vote could hardly be escaped, was any popular vote allowed. Elsewhere the functions of the voter ceased when he voted for delegates to the State convention.

The Border States.—The border States were in two tiers—North Carolina, Tennessee and Arkansas next to the seceding States, and Delaware, Maryland, Virginia, Kentucky and Missouri next to the free States. None of these was willing to secede. There was, however, one force which might draw them into secession. A State which did not wish to secede, but believed in State sovereignty and the abstract right of secession, would be inclined to take up arms to resist any attempt by the Federal Government to coerce a seceding State. In the following spring, the original seven seceding States were reinforced by four border States.

In the North and West surprisingly little attention was given to the systematic course of procedure along the Gulf. The people of those sections were very busy, they had heard much of this talk before, and looked upon it as a kind of stage thunder. Republican politicians, with the exception of a few, were inclined to refrain from public declarations of intention. Some of them such

as Seward, showed a disposition to let the "erring sisters" depart in peace, expecting to make the loss good by accessions from Canada. A few, like Senator Zachariah Chandler, believed that there would be "blood-letting," but most of them were still doubtful as to the future. In the North the leaders and the people generally shrank from the prospect of war Among the various proposals to this end, that offered in the Senate by John J Crittenden, of Kentucky, and known as the Crittenden compromise, was perhaps received with most favour. This took the form of six proposed amendments to the Constitution, of which two were virtually a re-phrasing of the essential feature of the Missouri Compromise and of the principle of squatter sovereignty, and others provided that the National Government should pay to the owner of any fugitive slave, whose return was prevented by opposition in the North, the full value of such slave, and prohibited the abolition of slavery in the District of Columbia "so long as it exists in the adjoining states of Virginia and Maryland or either." This proposed compromise was rejected by the Senate by a close vote on March 2, 1861 A peace congress, called by Virginia, met in Washington from Feb 4 to 27, 1861, 21 States being represented, and proposed a constitutional amendment embodying changes very similar to those of the Crittenden compromise, but its proposal was not acted upon by Congress Congress did nothing, except to admit Kansas as a free State and adopt the protective Morrill tariff; even after its members from the seceding States had withdrawn, those who remained made no preparations for conflict, and, at their adjournment in March 1861, left the Federal Government naked and helpless.

The War Governors.—The only sign of life in the body politic, the half-awakened word of warning from the Democracy of the North and West, was its choice of governors of States.[1] A remarkable group of men, soon to be known as the "war governors"—Israel Washburn of Maine, Erastus Fairbanks of Vermont, Ichabod Goodwin of New Hampshire, John Albion Andrew of Massachusetts, William Sprague of Rhode Island, William Alfred Buckingham of Connecticut, Edwin Dennison Morgan of New York, Charles Smith Olden of New Jersey, Andrew Gregg Curtin of Pennsylvania, William Dennison of Ohio, Oliver Perry Morton of Indiana, Richard Yates of Illinois, Austin Blair of Michigan, Alexander Williams Randall of Wisconsin, Samuel Jordan Kirkwood of Iowa, and Alexander Ramsey of Minnesota —held the executive powers of the Northern States in 1861–62 Some of these governors, such as Andrew and Buckingham, as they saw the struggle come nearer, went so far as to order the purchase of warlike material for their States on their private responsibility, and their action saved days of time.

U.S. Property Seized.—The little Army of the United States had been almost put out of consideration; wherever its detachments could be found in the South they were surrounded and forced to surrender and were transferred to the North. After secession, and in some of the States even before it, the forts, arsenals, munts, custom-houses, shipyards and public property of the United States had been seized by authority of the State, and these were held until transferred to the new Confederate States organization.

Only a few forts, of all the magnificent structures with which the nation had dotted the Southern coast, remained to it—the forts near Key West, Fortress Monroe at the mouth of Chesapeake Bay, Ft. Pickens at Pensacola and Ft. Sumter in Charleston Harbour. Both the last-named were beleaguered by hostile batteries, but the Administration of President Buchanan, intent on maintaining the peace until the new Administration should come in, instructed their commanding officers to refrain from any acts tending to open conflict. The Federal officers, therefore, were obliged to look idly on while every preparation was made for their destruction, and even while a vessel bearing supplies for Ft. Sumter was driven back by the batteries between it and the sea.

The divergence between the two sections of the country had thus passed into disunion, and was soon to pass into open hostility. The legal recognition of the custom of slavery, acting upon and reacted upon by every step in their economic development and every difference in their natural characteristics and institutions, had carried North and South farther and faster apart, until the elements of a distinct nationality had appeared in the South.

Secession had taken away many of the men who had for years managed the Federal Government, and who understood its workings. Lincoln's party was in power for the first time; his officers were new to the routine of Federal Administration; and the circumstances with which they were called upon to deal were such as to daunt any spirit The Government had become so nearly bankrupt in the closing days of Buchanan's Administration that it had escaped only by paying double interest. The Army had been almost broken up by captures of men and material and by resignations of competent and trusted officers The Navy had come to such a pass that, in Feb 1861, a House committee reported that only two vessels, one of 20, the other of two guns, were available for the defence of the entire Atlantic coast And, to complicate all difficulties, a horde of clamorous office-seekers crowded Washington

Civil War, 1861–65.—Soon after Lincoln's Administration began, the starting of an expedition to provision Ft. Sumter brought on an attack by the batteries around the fort, and after a bombardment of 36 hours the fort surrendered (April 14, 1861). It is not necessary to rehearse the familiar story of the outburst of feeling which followed this event and the proclamation of President Lincoln calling for volunteers. The 75,000 volunteers called for were supplied three or four times over.

There had been some belief in the South that the North-west would take no part in the impending conflict, and that its people could be persuaded to keep up friendly relations with the new nationality. In the spring months of 1861 Douglas, who had long been denounced as the tool of the Southern slave-holders, was spending the closing days of life in expressing the determination of the North-west that it would never submit to have "a line of custom-houses" between it and the ocean. The batteries which Confederate authority was erecting on the banks of the Mississippi were fuel to the flame. California, considered neutral by all parties, pronounced as unequivocally for the national authority.

The shock of arms put an end to opposition in the South as well. The peculiar isolation of life in the South precluded the more ignorant voter from any comparisons of the power of his State with any other; to him it was almost inconceivable that his State should own or have a superior. The better educated men, of wider experience, had been trained to think State sovereignty the foundation of civil liberty, and, when their State spoke, they felt bound to "follow their State." The president of the Confederate States issued his call for men, and it also was more than met.

The Border States.—Lincoln's call for troops met with an angry reception wherever the doctrine of State sovereignty had a foothold. The governors of the border States generally returned it with a refusal to furnish any troops. Two States, North Carolina and Arkansas, seceded and joined the Confederate States. In two others, Virginia and Tennessee, the State politicians formed "military leagues" with the Confederacy, allowing Confederate troops to take possession of the States and then submitted the question of secession to "popular vote" The secession of these States was thus accomplished, and Richmond became the Confederate capital. The same process was attempted in Missouri, but failed, and the State remained loyal. The politician class in Maryland and Kentucky took the extraordinary course of attempting to maintain neutrality; but the growing power of the Federal Government soon enabled the people of the two States to resume control of their governments and give consistent support to the Union. Kentucky, however, had troops in the Confederate armies; and one of her citizens, the late vice-president, John C Breckinridge, left the Senate and became an officer in the Confederate service. Delaware cast her lot from the first with the Union.

Civil War.—The first blood of the war was shed in the streets of Baltimore, when a mob attempted to stop Massachusetts troops on their way to Washington (April 19). For a time there was difficulty in getting troops through Maryland because of the active hostility of a part of its people, but this was overcome, and the national capital was made secure. The Confederate lines had been pushed up to Manassas Junction, about 30m. from Washington. When Congress, called into special session by the President for

July 4, came together, the outline of the Confederate States had been fixed. The length of the line, including also the Atlantic and Gulf coasts, has been estimated at 11,000 miles The territory within it comprised about 800,000sq m, with a population of over 9,000,000 and great natural resources Its cotton was almost essential to the manufactories of the world, in exchange for it every munition of war could be procured, and it was hardly possible to blockade a coast over 3,000m in length, on which the blockading force had but one port of refuge, and that at about the middle of the line. Nevertheless, President Lincoln issued his first call for troops on April 15 President Davis then issued a proclamation (on the 17th) offering letters of marque and reprisal against the commerce of the United States to private vessels, and on the 19th Lincoln answered with a proclamation announcing the blockade of the Southern coast The news brought out proclamations of neutrality from Great Britain and France.

The President found himself compelled to assume powers never granted to the executive authority, trusting to the subsequent action of Congress to validate his action He had to raise and support armies and navies; he even had to authorize seizures of necessary property, of railroad and telegraph lines, arrests of suspected persons, and the suspension of the writ of *habeas corpus* in certain districts Congress supported him, and proceeded in 1863 to give the President power to suspend the writ anywhere in the United States; this power he promptly exercised The Supreme Court, after the war, in the Milligan case (4 Wallace, 133) decided that no branch of the Government had power to suspend the writ in districts where the courts were open—that the *privilege* of the writ might be suspended as to persons properly involved in the war, but that the writ was still to issue, the court deciding whether the person came within the classes to whom the suspension applied.

When Congress met (July 4, 1861) the absence of Southern members had made it heavily Republican It decided to consider no business but that connected with the war, authorized a loan and the raising of 500,000 volunteers, and made confiscation of property a penalty of rebellion. While it was in session the first serious battle of the war—Bull Run, or Manassas—took place (July 21), and resulted in the defeat of the Federal Army.

The "Trent" Case.—The over-zealous action of a naval officer in taking the Confederate envoys James M. Mason and John Slidell out of the British steamer "Trent" sailing between two neutral ports almost brought about a collision between the United States and Great Britain in November. But the American precedents were all against the United States, and the envoys were given up.

The broad-construction tendencies of the Republican party showed themselves more plainly as the war grew more serious; there was an increasing disposition to cut every knot by legislation, with less regard to the constitutionality of the legislation A paper currency commonly known as "greenbacks," was adopted and made legal tender (Feb. 25, 1862). Slavery was prohibited (April 16) in the District of Columbia and the Territories (June 19); the Army was forbidden to surrender escaped slaves to their owners; and slaves of insurgents were ordered to be confiscated. In addition to a homestead act giving public lands to actual settlers at reduced rates, Congress began a further development of the system of granting public lands to railways. Another important act (1862) granted public lands for the establishment of agricultural and mechanical colleges.

Railways.—The railway system of the United States was but 20 years old in 1850, but it had begun to assume some consistency. The day of short and disconnected lines had passed, and the connections which were to develop into railway systems had appeared Consolidation of smaller companies had begun; the all-rail route across the State of New York was made up of more than a dozen original companies at its consolidation in 1853. The Erie railway, chartered in 1832, was completed from Piermont to Dunkirk (N.Y.), in 1851; and another line—the Pennsylvania—was completed from Harrisburg to Pittston (Pa.), in 1854. These were at least the germs of great trunk lines. The cost of American railways has been only from one-half to one-fourth of the cost of European railways, but an investment in a Far-western railway in 1850–60 was an extra-hazardous risk. Not only did social conditions make any form of business hazardous, the new railway often had to enter a territory bare of population, and there create its own towns, farms and traffic Whether it could do so was so doubtful as to make additional inducements to capital necessary. The means attempted by Congress in 1850, in the case of the Illinois Central railroad, was to grant public lands to the corporation, reserving to the United States the alternate sections. At first grants were made to the States for the benefit of the corporations; the act of 1862 made the grant directly to the corporation

The vital military and political necessity of an immediate railway connection with the Pacific coast was hardly open to doubt in 1862, but the necessity scarcely justified the terms which were offered and taken. The Union Pacific railroad was incorporated; the United States Government was to issue to it bonds, on the completion of each 40m, to the amount of $16,000 per mile, to be a first mortgage, through Utah and Nevada the aid was to be doubled, and for some 300m of mountain building to be trebled, and, in addition to this, alternate sections of land were granted The land-grant system, thus begun, was carried on extensively, the largest single grants being those of 47,000,000ac. to the Northern Pacific (1864) and of 42,000,000ac. to the Atlantic and Pacific line (1866)

Paper Prices.—Specie payments had been suspended almost everywhere towards the end of 1861; but the price of gold was but 102 5 at the beginning of 1862 About May its price in paper currency began to rise It touched 170 during the next year, and 285 in 1864; but the real price probably never went much above 250 Other articles felt the influence in currency prices

Tariff and Taxes.—The duties on imports were driven higher than the original Morrill tariff had ever contemplated The average rates, which had been 18% on dutiable articles and 12% on the aggregate in 1860–61, rose, before the end of the war, to nearly 50% on dutiable articles and 35% on the aggregate Domestic manufactures sprang into new life under such encouragement, everyone who had spare wealth converted it into manufacturing capital. The probability of such a result had been the means of getting votes for an increased tariff; free traders had voted for it as well as protectionists For the tariff was only a means of getting capital into positions in which taxation could be applied to it, and the "internal revenue" taxation was merciless beyond precedent The annual increase of wealth from capital was then about $550,000,000; the internal revenue taxation on it rose in 1866 to $310,000,000, or nearly 60%.

Bonds.—The stress of all this upon the poor must have been great, but it was relieved in part by the bond system on which the war was conducted While the armies and navies were shooting off large blocks of the crops of 1880 or 1890, work and wages were abundant for all who were competent for them. It is true, then, that the poor paid most of the cost of the war; it is also true that the poor had shared in that anticipation of the future which had been forced on the country, and that, when the drafts on the future came to be redeemed, it was done mainly by taxation on luxuries. The destruction of a Northern railway meant more work for Northern iron mills and their workmen The destruction of a Southern road was an unmitigated injury; it had to be made good at once, by paper issues; the South could make no drafts on the future, by bond issues, for the blockade had put cotton out of the game, and Southern bonds were hardly salable. Every expense had to be met by paper issues; each issue forced prices higher. *A Rebel War-Clerk's Diary* gives the following as the prices in the Richmond market for May 1864: "Boot, $200; coats, $350; pantaloons, $100; shoes, $125; flour, $275 per barrel; meal, $60 to $80 per bushel; bacon, $9 per pound, no beef in market; chickens, $30 per pair; shad, $20; potatoes, $25 per bushel; turnip greens, $4 per peck; white beans, $4 per quart or $120 per bushel; butter, $15 per pound; wood, $50 per cord."

Manufactures.—The complete lack of manufactures told heavily against the South from the beginning As men were drawn from agriculture in the North and West, the increased de-

mand for labour was shaded off into an increased demand for agricultural machinery; every increased percentage of power in reaping-machines liberated so many men for service at the front. The reaping-machines of the South—the slaves—were incapable of any such improvement and, besides, required the presence of a portion of the possible fighting men at home to watch them. But no insurrection took place

The pressing need for men in the Army made the Confederate Congress utterly unable to withstand the growth of executive power. Its bills were prepared by the Cabinet, and the action of Congress was quite perfunctory. The suspension of the writ of *habeas corpus*, and the vast powers granted to President Davis, or assumed by him, made the Confederate Government almost a despotism. It was not until the closing months of the war that the expiring Confederate Congress mustered up courage enough to oppose the President's will.

Banking.—Another act of Federal legislation—the National Bank Act (Feb. 25, 1863; supplemented by the act of June 3, 1864)—should be mentioned here, as it was closely connected with the sale of bonds The banks were to be organized and, on depositing United States bonds at Washington, were to be permitted to issue notes up to 90% of the value of the bonds deposited. As the redemption of the notes was thus assured, they circulated without question all over the United States. By a subsequent act (1865) the remaining State bank circulation was taxed out of existence.

West Virginia.—At the beginning of 1862 the lines of demarcation between the two powers had become plainly marked. The western part of Virginia had separated itself from the parent State, and was admitted as a State (1863) under the name of West Virginia. It was certain that Delaware, Maryland, Kentucky and Missouri had been saved to the Union, and that the battle was to be fought out in the territory to the south of them.

The Emancipation Proclamation.—At the beginning of the war the people and leaders of the North had not desired to interfere with slavery, but circumstances had been too strong for them. Lincoln had declared that he meant to save the Union as best he could—by preserving slavery, by destroying it or by destroying part and preserving part. Just after the battle of Antietam (Sept. 17, 1862) he issued his proclamation calling on the revolted States to return to their allegiance before the next year, otherwise their slaves would be declared free men. No State returned and the threatened declaration was issued on Jan 1, 1863. As President, Lincoln could issue no such declaration; as commander-in-chief of the armies and navies of the United States he could issue directions only as to the territory within his lines; but the Emancipation Proclamation applied only to territory outside of his lines. It has therefore been debated whether the proclamation was in reality of any force It may fairly be taken as an announcement of the policy which was to guide the Army and as a declaration of freedom taking effect as the lines advanced At all events, this was its exact effect. Its international importance was far greater. The locking up of the world's source of cotton supply had been a general calamity, and the Confederate Government and people had steadily expected that the English and French Governments would intervene in the war. The conversion of the struggle into a crusade against slavery made intervention impossible.

Confederate Privateers.—Confederate agents in England were numerous and active. Taking advantage of every loophole in the British Foreign Enlistment Act, they built and sent to sea the "Alabama" and "Florida," which for a time almost drove Federal commerce from the ocean Whenever they were closely pursued by United States vessels they took refuge in neutral ports until a safe opportunity occurred to put to sea again. Another, the "Georgia," was added in 1863. All three were destroyed in 1864. Confederate attempts to have iron-clads equipped in England and France were unsuccessful.

The Victory of the North.—The turning-point of the war was evidently in the early days of July 1863, when the victories of Vicksburg and Gettysburg came together. The National Government had at the beginning cut the Confederate States down to a much smaller area than might well have been expected; its armies had pushed the besieging lines far into the hostile territory; and the war itself had developed a class of generals who cared less for the conquest of territory than for destroying the opposing armies. The great drafts on the future which the credit of the Federal Government enabled the North to make gave it also a startling appearance of prosperity; so far from feeling the war, it was driving production of every kind to a higher pitch than ever before.

The war had not merely developed improved weapons and munitions of war; it had also spurred the people on to a more careful attention to the welfare of the soldiers, the fighting men drawn from their own number. The sanitary commission, the Christian commission, and other voluntary associations for the physical and moral care of soldiers, received and disbursed very large sums. The National Government was paying an average amount of $2,000,000 per day for the prosecution of the war and, in spite of the severest taxation, the debt grew to $500,000,000 in June 1862, to twice that amount a year later, to $1,700,000,000 in June 1864 and reached its maximum on Aug. 31, 1865—$2,845,907,626. But this lavish expenditure was directed with energy and judgment. The blockading fleets were kept in perfect order and with every condition of success. The railway and telegraph were brought into systematic use for the first time in modern warfare. Late in 1863 Edwin M. Stanton, the secretary of War, moved two corps of 23,000 men from Washington to Chattanooga, 1,200m., in seven days.

Conscription.—On the other hand, the Federal Armies now held almost all the great southern through lines of railway, except the Georgia lines and those which supplied Lee from the South. The want of the Southern people was merely growing in degree, not in kind. The conscription, sweeping from the first, had become omnivorous; towards the end of the war every man between 17 and 55 was legally liable to service, and in practice the only limit was physical incapacity. In 1863 the Federal Government also was driven to conscription. The first attempts to carry it out resulted in forcible resistance in several places, the worst being the "draft riots" in New York (July), when the city was in the hands of the mob for several days All the resistance was put down, but exemptions and substitute purchases were so freely permitted that the draft in the North had little effect except as a stimulus to the States in filling their quotas of volunteers by voting bounties.

Election of 1864.—In 1864 Lincoln was re-elected with Andrew Johnson as vice-president. The Democratic convention had declared that, after four years of failure to restore the Union by war, during which the Constitution had been violated in all its parts under the plea of military necessity, a cessation of hostilities ought to be obtained, and had nominated Gen. George B. McClellan and G. H. Pendleton. Farragut's victory in Mobile Bay (Aug. 5), by which he sealed up the last port, except Wilmington, of the blockade-runners, and the evidently staggering condition of the Confederate resistance in the East and the West, were the sharpest commentaries on the Democratic platform, its candidates carried only three of the 25 states taking part in the election. The 36th State—Nevada—had been admitted in 1864.

Surrender of Lee.—The actual fighting of the war ended with the surrender of Gen. Robert E. Lee to Gen. U.S Grant at Appomattox, Va., April 9, 1865. All the terms of surrender named by Grant were generous: no private property was to be surrendered; both officers and men were to be dismissed on parole, not to be disturbed by the United States Government so long as they preserved their parole and did not violate the laws; and he instructed the officers appointed to receive the paroles "to let all the men who claim to own a horse or mule take the animals home with them to work their little farms." Gen. Joseph E. Johnston, with the only other considerable army in the field, surrendered on much the same terms at Durham Station, N.C. (April 26), after an unsuccessful effort at a broader settlement. All organized resistance had now ceased; Union cavalry were ranging the South, picking up Government property or arresting leaders; but it was not until May that the last detached parties

of Confederates gave up the contest.

Death of Lincoln.—Just after Lee's surrender President Lincoln died by assassination (April 15), the crime of a half-crazed enthusiast Even this event did not impel the U S people to any vindictive use of their success for the punishment of individuals. In the heat of the war, in 1862, congress had so changed the criminal law that the punishment of treason and rebellion should no longer be death alone, but death or fine and imprisonment. Even this modified punishment was not inflicted. There was no hanging; some of the leaders were imprisoned for a time, but never brought to trial

The Armies.—The Armies of the Confederacy are supposed to have been at their strongest (700,000) at the beginning of 1863; and it is doubtful whether they contained 200,000 men in March 1865. The dissatisfaction of the southern people at the manner in which Davis had managed the war seems to have been profound; and it was converted into hero worship only by the ill-advised action of the federal government in arresting and imprisoning him. Desertion had become so common in 1864, and the attempts of the Confederate government to force the people into the ranks had become so arbitrary, that the bottom of the Confederacy had dropped out of it before Sherman moved northward from Savannah, Ga. On the contrary, the numbers of the Federal armies increased steadily until March 1865, when they were a few hundreds more than 1,000,000. As soon as organized resistance ceased, the disbanding of the men began; they were sent home at the rate of about 300,000 a month, about 50,000 being retained in service as a standing army.

Cost of the War.—The direct cost of the Civil War has been variously estimated, the best estimate including the first three years of reconstruction being $5,000,000,000 to the North and $3,000,000,000 to the South. But if pensions, interest and other such items up to 1910 are included, the result is a total of between $11,000,000,000 and $12,000,000,000 for the North alone. But the cost to the South also was enormous; $4,000,000,000 cannot be an exaggeration.

FROM 1865 TO 1910

The capitulation of Lee (April 9, 1865), followed by the assassination of Lincoln (April 15) and the surrender of the last important Confederate army, under J. E. Johnston, marked the end of the era of war and the beginning of that of reconstruction, which involved a revolution in the social and political structure of the South, in the relation of state and nation in the American federal union, and in the economic life of the whole country.

Condition of the South.—Economically the condition of the

South was desperate. The means of transport were destroyed; railways and bridges were ruined; Southern securities were valueless; the Confederate currency system was completely disorganized. Emancipated negroes wandered idly from place to place, trusting the Union armies for sustenance, while their former masters toiled in the fields to restore their plantations.

The social organization of the South had been based on negro slavery. Speaking generally, the large planters had constituted the dominant class, especially in the cotton States; and in the areas of heaviest negro population these planters had belonged for the most part to the old Whig Party. Outside of the larger plantation areas, especially in the hill regions and the pine barrens, there was a population of small planters and poor whites who belonged in general to the Democratic Party. In the mountain regions, where slavery had hardly existed, there were Union areas, and from the poor whites of this section had come Andrew Johnson, senator and war governor of Tennessee, who was chosen vice-president on the Union ticket with Lincoln in 1864 as a recognition of the Union men of the South.

The North.—The importance of personality in history was clearly illustrated when the wise and sympathetic Lincoln, who had the confidence of the masses of the victorious North, was replaced by Johnson, opinionated and intemperate, whose antecedents as a Tennessean and Democrat, and whose State rights principles and indifference to Northern ideals of the future of the negro made him distrusted by large numbers of the Union Republican Party.

The composition of this party was certain to endanger its stability when peace came. It had carried on the war by a coalescence of Republicans, War Democrats, Whigs, Constitutional Unionists and Native Americans, who had rallied to the cause of national unity At the outset it had asserted that its purpose was not to interfere with the established institutions in slave States, but to defend the Constitution, and to preserve the Union. But the war had destroyed slavery, as well as preserved the Union, and the civil status of the negro and the position of the revolted States now became burning questions To the extremists of the Radical wing it seemed in accordance with the principles of human liberty that the negro should not only be released from slavery but should also receive full civil rights, including the right to vote. This group was also ready to revolutionize Southern society by destroying the old ascendancy of the great planter-class.

For many years before the war, parties had differed on such important questions as the tariff, internal improvements and foreign policy, and the South had used its alliance with the Northern Democracy to resist the economic demands of the industrial interests of the North. A return of Southern congressmen might mean a revival of the old political situation, with the South and the Northern Democracy once more in the saddle.

Attitude of the Two Sections.—Any attempt to restore the South to full rights, therefore, without further provision for securing for the freedmen the reality of their freedom, and without some means of establishing the political control of the victorious party, would create party dissension Even Lincoln had aroused the bitter opposition of the radical leaders by his generous plan of reconstruction Johnson could have secured party support only by important concessions to the powerful leaders in Congress; and these concessions he was temperamentally unable to make. The masses of the North, especially in the first rejoicings over the peace, were not ungenerous in their attitude; and the South as a whole, accepted the results of defeat in so far as to acquiesce in the permanence of the Union and the emancipation of the slaves, the original issues of the war.

Reconstruction.—In the settlement of the details of reconstruction, however, there were abundant opportunities for the hatred engendered by the war to flame up once more. As it became clear that the Northern majority was determined to exclude the leaders of the South from political rights in the reconstruction of the Union, and especially as the radicals disclosed their purpose to ensure Republican ascendancy by subjecting the section to the rule of the loyalist whites and, later to that of the emancipated negroes, good will disappeared, and the South entered upon a fight for its social system. The natural leaders of the people, men of intelligence and property, had been the leaders of the section in the war. Whatever their views had been at first as to secession, the great majority of the Southern people had followed the fortunes of their States. To disfranchise their leaders was to throw the control into the hands of a less able and small minority of whites; to enfranchise the blacks while disfranchising the white leaders was to undertake the task of subordinating the former political people of a section to a different race, just released from slavery, ignorant, untrained and without property.

These underlying forces were in reality more influential than the constitutional theories which engaged so much of the discussion in Congress, theories which, while they afford evidence of the characteristic desire to proceed constitutionally were really urged in support of, or opposition to, the interests just named.

The most extreme Northern Democrats, and their Southern sympathizers, starting from the premise that constitutionally the Southern States had never been out of the Union, contended that the termination of hostilities restored them to their former rights in the Federal Union unimpaired and without further action This theory derived support from President Lincoln's view that not States, but assemblages of individuals, had waged war against the Government. The theory of the extreme Republican Radicals was formulated by Sumner and Stevens. Sumner contended that, while the States could not secede, they had by waging war reduced themselves to mere Territories, entitled only to the rights of Territories. Stevens, appealing to the facts of secession, declared the Southern States conquered provinces, subject to be disposed of at the will of the conqueror. In the end Congress adopted a middle ground, holding that while the States could not leave the Union, they were, in fact, out of normal relations, and that the constitutional right of the Federal Government to guarantee republican Governments to the various States gave to Congress the power to impose conditions precedent to their rehabilitation.

It is necessary to recall the initiation of reconstruction measures by President Lincoln rightly to understand the position which was taken by President Johnson. Impatient of theoretical discussion, Lincoln laid down practical conditions of restoration in his proclamation of Dec. 8, 1863 In this he offered amnesty to those who would take an oath of loyalty for the future and accept the acts of Congress and the proclamation of the President with reference to slaves. From the amnesty he excepted the higher military, civil and diplomatic officers of the Confederacy as well as those who had relinquished judicial stations, seats in Congress, or commissions in the Army or Navy and those who had treated persons in the Federal service otherwise than lawfully as prisoners of war. The proclamation provided, further, that when in any of the seceding States (except Virginia, where the President had already recognized the loyal Government under Gov. Francis H Pierpont) a number of persons not less than one-tenth of the voters in 1860 should have taken the above described oath, and, being qualified voters under the laws of the State in 1860, should have established a State Government, republican in form, it should be recognized

The First Reconstruction Bill.—Although Lincoln expressly pointed out that the admission of the restored States to representation in Congress rested exclusively with the respective houses, and announced his readiness to consider other plans for reconstruction, heated opposition by the radicals in Congress was called out by this proclamation. They feared that it did not sufficiently guarantee the abolition of slavery, which up to this time rested on the war powers of the President, and they asserted that it was the right of Congress, rather than of the President, to determine the conditions and the process of reconstruction. In a bill which passed the House by a vote of 73 to 59 and was concurred in by the Senate, Congress provided that reconstruction was to be begun only when a majority of the white male citizens of any one of the Confederate States should take oath to support the Constitution of the United States. The President should then invite them to call a Constitutional Convention. The electors of this convention would be required to take an oath of

allegiance which excluded a much larger class than those deprived of the benefit of the amnesty proclamation, for it eliminated all who had voluntarily borne arms against the United States, or encouraged hostility to it, or voluntarily yielded support to any of the Confederate Governments The bill also required that the State Constitution should exclude a large proportion of the civil and military officers of a Confederate Government from the right of voting, and that it should provide that slavery be forever abolished and that State and Confederate debts of the war period should never be paid. In July 1864 Lincoln gave a "pocket veto" to the bill and issued a proclamation explaining his reasons for refusing to sign The triumph of Lincoln in the election of 1864 did not clearly signify the will of the people upon the conditions of reconstruction, for the declaration of the Democratic convention that the war was a failure overshadowed the issue, and the Union Party which supported Lincoln was composed of men of all parties

Thirteenth Amendment.—On Jan. 31, 1865, the House concurred in the vote of the Senate in favour of the 13th amendment to the Constitution abolishing slavery throughout the Union Four years earlier Congress had submitted to the States another 13th amendment by the terms of which no amendment should ever authorize Congress to interfere with slavery within the States But owing to the war this amendment had remained unratified, and now Congress proposed to place beyond constitutional doubt, or the power of States to change it, the emancipation of slaves By Dec 18, 1865, the amendment had been ratified and was proclaimed in force.

In the meantime, Louisiana, in accordance with Lincoln's proclamation, had adopted a Constitution and abolished slavery within the State. Owing to the obstructive tactics of Sumner, aided by Democrats in the Senate, Congress adjourned on March 4, 1865, without having recognized this new State Government as legitimate "If we are wise and discreet," said Lincoln, "we shall reanimate the states and get their governments in successful operation with order prevailing and the Union re-established before Congress comes together in December."

President Johnson.—Such was the situation when Johnson took up the Presidency upon Lincoln's death. After an interval of uncertainty in which he threatened vengeance against various Southern leaders, President Johnson accepted the main features of Lincoln's policy. Congress not being in session, he was able to work out an executive reconstruction on the lines of Lincoln's policy during the summer and autumn of 1865. On May 29, he issued a proclamation of amnesty, requiring of those who desired to accept its provisions an oath to support the Constitution and Union, and the laws and proclamations respecting the emancipation of slaves. Certain specified classes of persons were excepted, including certain additions to those excluded by Lincoln, especially "all persons who have voluntarily participated in said rebellion and the estimated value of whose taxable property is over twenty thousand dollars" This provision was characteristic of Johnson, who disliked the Southern planting aristocracy, and aimed at placing the preponderant power in the hands of the Democratic small farmers. As part of his system he issued another proclamation in which he appointed a governor for North Carolina and laid down a plan for reconstruction By this proclamation it was made the duty of the governor to call a convention chosen by the loyal people of the State, for the purpose of altering the State Constitution and establishing a State Government. The right to vote for delegates to this convention was limited to those who had taken the oath of amnesty and who had been qualified to vote prior to the secession of the State.

Already Virginia, Tennessee, Louisiana and Arkansas had Governments which had been recognized by Lincoln. Between June 13 and July 13, 1865, Johnson applied the same process which he had outlined for North Carolina to the remaining States of the Confederacy. Before Congress met in December all the Confederate States, except Texas (which delayed until the spring of 1866), had formed Constitutions and elected Governments in accordance with the presidential plan. All of their legislatures, except that of Mississippi, ratified the 13th amendment.

Gradually, however, the South turned to its former leaders to shape its policy, and the radical Republicans of the North were alarmed at the rapidity of the process of restoration on these principles. The disorganized and idle condition of the former slaves constituted a serious element in the Southern situation, as Lincoln had foreseen. The negroes expected a grant of land from confiscated Southern estates, and it was difficult to preserve order and to secure a proper labour supply.

Under these conditions the efforts of the South to provide security for their communities by bodies of white militia were looked upon with apprehension by the North, and there was sufficient conflict between the two races to give colour to charges that the South was not accepting in good faith the emancipation of the slaves. Especially irritating to Northern sentiment were the so-called "black codes" or "peonage laws," passed by the newly elected Southern legislatures. They rested on the belief that it was necessary that the former slaves should be treated as a separate and dependent class. Some of these imposed special disabilities upon the negro in the matter of carrying weapons and serving as witnesses. Vagrancy laws and provisions regarding labour contracts which had precedents in colonial and English legislation, but were specifically framed to restrain the negroes only, were common. Mississippi denied them the right to own land, or even to rent it outside of incorporated towns; South Carolina restricted them to husbandry and to farm or domestic service, unless specially licensed.

The Freedmen's Bureau.—The problem of succouring and protecting the negroes had forced itself upon the attention of the North from the beginning of the war, and on March 3, 1865, Congress had created the Freedmen's Bureau with the power to assign abandoned lands, in the States where the war had existed, to the use of the freedmen; to supervise charitable and educational activities among them; to exercise jurisdiction over controversies in which a freedman was a party, and to regulate their labour contracts. The local agents of the bureau were usually Northern men, some of them gave the worst interpretation to Southern conditions and aroused vain hopes in the negroes that the lands of the former masters would be divided among them; and later many became active in the political organization of the negro.

Although the National Government itself had thus recognized that special treatment of the freedmen was necessary, Congress, on assembling in Dec. 1865, was disposed to regard the course of the South in this respect with deep suspicion Moreover, as the 13th amendment was now ratified, it was seen that the South, if restored according to the presidential policy, would return to Congress with added representatives for the freed negroes. Only three-fifths of the negro slaves had been counted in apportioning representatives in Congress; though now free they were not allowed to vote Under the leadership of the Radicals, Congress refused, therefore, to receive the representatives of the States which had met the conditions of the President's proclamations. A joint committee of 15 took the whole subject of reconstruction under advisement, and a bill was passed continuing the Freedmen's Bureau indefinitely. When this was vetoed by President Johnson (Feb. 19, 1866) Congress retaliated by a concurrent resolution (March 2) against admitting any reconstructed State until Congress declared it entitled to recognition, thus asserting for the legislative body the direction of reconstruction.

While the measure was under consideration the President in an intemperate public address stigmatized the leaders of the Radicals by name as labouring to destroy the principles of the Government and even intimated that the assassination of the President was intended. It was hardly possible to close the breach after this, and the schism between the President and the leaders of the Union Republican Party was completed when Congress passed (April 9, 1866) the Civil Rights bill over Johnson's veto. The act declared the freedmen to be citizens of the United States with the same civil rights as white persons and entitled to the protection of the Federal Government.

The Fourteenth Amendment.—To place this measure beyond the danger of overthrow by courts or by a change of party majority, on June 13, 1866, Congress provided for submitting to

the States a 14th amendment to the Constitution. This gave constitutional guarantee of citizenship and equal civil rights to freedmen, and in effect provided that when in any State the right to vote should be denied to any of the male inhabitants 21 years of age and citizens of the United States, except for participation in rebellion or other crime, the basis of representation in the State should be reduced in the proportion which the number of such citizens bore to the whole number of male citizens 21 years of age in the State. This section of the amendment, therefore, left the States the option between granting the suffrage to the negro or suffering a proportionate reduction in the number of representatives in Congress. It was a fair compromise which might have saved the South from a long period of misrule and the North from the ultimate breakdown of its policy of revolutionizing Southern political control by enfranchisement of the blacks and disfranchisement of the natural leaders of the whites.

In order to ensure the passage of this amendment the radical leaders proposed bills which declared that, after its adoption, any of the seceding States which ratified it should be readmitted to representation. But it also provided that the higher classes of officials of the Confederacy should be ineligible to office in the Federal Government. These bills were allowed to await the issue of the next election.

For further protection of the rights of the negro, Congress succeeded in passing, over President Johnson's veto, an act continuing the Freedmen's Bureau for two years. Tennessee, having ratified the 14th amendment, was (July 24, 1866) restored to representation and Congress adjourned, leaving the issue between the President and the legislative body to the people in the Congressional elections.

Party Changes.—The campaign brought with it some realignment of party. President Johnson, having broken with the leaders of the Union Republican Party, was more and more forced to rely upon Democratic support, although his executive appointments were still made from the ranks of the Republicans. The so-called National Union convention, which met in Philadelphia in midsummer in an effort to abate sectionalism, and to endorse the President's policy, included a large number of war Democrats who had joined the Union party after the secession of the South, many moderate Southerners, a fragment of the Republican Party, and a few Whigs, especially from the border States. They claimed that the Southern States had a right to be represented in Congress. Other meetings friendly to the Radicals were called, and under the designation of Union-Republican Party they declared for the congressional policy. While the campaign for elections to Congress was in progress the President made a journey to Chicago, speaking at various cities *en route* and still further alienating the Republicans by abuse of his opponents. As a result of the autumn elections two-thirds of the members of the House of Representatives were opposed to him. Almost contemporaneously every seceding State except Tennessee rejected the 14th amendment, paving the way for the entire triumph of the Northern extremists.

Tenure of Office Act.—In the ensuing winter and spring Congress completed the conquest of the President, awed the Supreme Court, and provided a drastic body of legislation to impose negro suffrage on the South. By the Tenure of Office Act (March 2, 1867) Congress forbade the President to remove civil officers without the consent of the Senate, and at the same time by another act required him to issue military orders only through the general of the Army (Grant), whom the President was forbidden to remove from command or to assign to duty at another place than Washington, unless at the request of the officer or by the prior assent of the Senate. These extraordinary invasions of the presidential authority were deemed necessary to prevent Johnson from securing control of the military arm of the Government, and to protect Edwin Stanton, the secretary of war, and Gen. Grant. Fearing the President might take advantage of the interim when Congress would not be in session, the 40th Congress was required to meet on March 4, immediately following the expiration of the 39th

Other Legislative Acts.—The Reconstruction Act of March 2, 1867, provided for the military Government of the Southern States while the drastic policy of Congress was being carried out. It was passed over the veto of the President and declared that no legal Governments or adequate protection for life or property existed in the seceding States, except Tennessee. These States it divided into five military districts, each to be placed under the command of a general of the Army, whose duty it was to preserve law and order. But the existing civil Governments were declared provisional only and subject to the paramount authority of the United States to abolish, modify, control, or supersede them. The act further provided that a Constitutional Convention might be elected by the adult male citizens of the State, of whatever race, colour or previous condition, resident in the State for a year, except such as might be disfranchised for rebellion or felony.

When the convention, thus chosen under negro suffrage, and with the exclusion of Confederate leaders, should have framed a State Constitution conforming to the Federal Constitution and allowing the franchise to those entitled to vote for the members of the convention, the Constitution was to be submitted for the approval of Congress If this were obtained and if the State adopted the 14th amendment, and this amendment became a part of the Federal Constitution, then the State should be entitled to representation in Congress; but the senators and representatives sent to Congress were required to take the "iron-clad oath," which excluded those who had fought in the Confederate service, or held office under any Government hostile to the United States, or given support to any such authority.

By the pressure of military control Congress thus aimed at forcing the adoption of the 14th amendment, as well as the acceptance of negro suffrage in the State Constitutions of the South. A supplementary act of March 23, 1867, and an act of interpretation passed on July 19 completed this policy of "thorough." In the registration of voters the district commanders were required to administer an oath which excluded those disfranchised for rebellion and those who after holding State or Federal office had given aid and comfort to the enemies of the United States.

Supreme Court Decisions.—Against this use of military power to govern States in time of peace the Supreme Court interposed no effective obstacle. Like the executive it was subordinated to Congress It is true that in the case *ex parte* Milligan, decided in Dec. 1866, the court held military commissions unlawful where the ordinary civil tribunals were open. In the case of Cummings v. Missouri (Jan. 14, 1867) it decided also that a State test oath excluding Confederate sympathizers from professions was a violation of the prohibition of *ex post facto* laws; and the court (*ex parte* Garland) applied the same rule to the Federal test oath so far as the right of attorneys to practise in Federal courts was concerned.

But threats were made by the radicals in Congress to take away the appellate jurisdiction of the court, and even to abolish the tribunal by constitutional amendment. The judges had been closely divided in these cases and, when the real test came, the court refused to set itself in opposition to Congress. When Mississippi attempted to secure an injunction to prevent the president from carrying out the reconstruction acts, and when Georgia asked the court to enjoin the military officers from enforcing these acts in that State, the Supreme Court refused (April and May 1867), pleading want of jurisdiction. Chief Justice Salmon P. Chase argued that if the President refused to obey, the court could not enforce its decree, while if he complied with the order of the court, and if the House of Representatives impeached him for refusing to enforce the law, the Supreme Court would be forced to the vain attempt to enjoin the Senate from sitting as a court of impeachment.

In one instance it seemed inevitable that the court would clash with Congress; the McCardle case involved an editor's arrest by military authority for criticizing that authority and the reconstruction policy. But Congress, apprehending that the majority of the court would declare the reconstruction acts unconstitutional, promptly repealed that portion of the act which gave the court jurisdiction in the case, and thus enabled the judges to dismiss the appeal. Afterwards, when the reconstruction policy had been accomplished, the court, in the case of Texas v. White

(1869), held that the Constitution looked to "an indestructible Union composed of indestructible states"; and that although the secession acts were null, and the Federal obligations of the seceding States remained unimpaired, yet their rights were suspended during the war

Impeachment of President Johnson.—The powerful leaders of the Republicans in Congress had been awaiting their opportunity to rid themselves of President Johnson by impeachment For full details of these efforts *see* JOHNSON, ANDREW. His trial in the spring of 1868, however, by the Senate resulted in a verdict of acquittal.

"Carpet-baggers."—Meanwhile the military reconstruction of the South and the organization of the negro vote progressed effectively. The party management of the negroes was conducted by "carpet-baggers," as the Northern men who came South to try their fortunes were nicknamed, and by the white loyalists of the South, to whom was given the name "scalawags." In the work of marshalling the freedmen's vote for the Republican Party secret societies like the Loyal League, or Union League played an important part As the newly enfranchised mass of politically untrained negroes passed under Northern influence politically, the Southern whites drew more and more together and although they were unable under the existing conditions to take control, they awaited their opportunity. A "Solid South" was forming in which old party divisions gave way to the one dominant antagonism to Republican ascendancy by negro suffrage. Politically the important fact was that the Republicans had rejected the possibility of reviving the old party lines in the South, and had gambled upon the expectation of wielding the united coloured vote with such leadership and support as might be gained from former Northerners and loyal whites In the end negro rule failed, as was inevitable when legal disabilities and military force were removed; but the masses of the Southern whites emerged with a power which they had not possessed under the old rule of the planting aristocracy. For the time being, however, negro votes gave control to the Republicans. In South Carolina, Florida, Alabama, Mississippi and Louisiana the negroes were in a majority; in Virginia, North Carolina, Arkansas and Texas they were in the minority, while in Georgia the two races were nearly evenly balanced.

Ku-Klux Klan.—The white leaders of the South were divided as to the best means of meeting the problem. Some advocated that those entitled to vote should register, and then refrain from the polls, in order to defeat the Constitutions made under negro suffrage, for the law required them to be ratified by a majority of the qualified voters. Others would have the white race bear no part in the process. Societies such as the "Ku-Klux Klan" and the "Knights of the White Camelia" were organized to intimidate or restrain the freedmen. But for the present the Republicans carried all before them in the South. Some of the new State Constitutions imposed severe disfranchisement upon the former dominant class, and before the end of July 1868 all of the former Confederate States, except Virginia, Mississippi and Texas, had ratified the 14th amendment, which was proclaimed in effect. By the beginning of 1870 these three States had also ratified the amendment, as had Georgia a second time, because of her doubtful status at the time of her first ratification.

The Southern States Restored to the Union.—By the summer of 1868 Arkansas, South Carolina, North Carolina, Georgia, Alabama, Louisiana and Florida, having satisfied the requirements of the reconstruction acts, were entitled to representation in Congress But Georgia did not choose her senators until after the adjournment of Congress, and, inasmuch as the State excluded the negro members of the legislature in September, Congress on reassembling returned the State to military rule until its submission. Alabama was restored in spite of the fact that her white voters had remained away from the polls in sufficient numbers to prevent a majority of all the voters registered from having ratified the constitution. The nominating conventions and the campaign of 1868 gave interesting evidence of the trend of political and economic events. Party lines, which had broken down in the North when all united in saving the Union, were once more reasserting themselves President Johnson, who had been elected by the Union Republican Party, had found his most effective support among the Democrats. The Republicans turned to Gen Grant, a Democrat before the outbreak of the war.

Grant Nominated.—The Republican nominating convention met on May 20, 1868, a few days after the failure of the impeachment proceedings, and it chose Grant as the candidate for the Presidency The platform supported the congressional reconstruction measures. Upon the vital question whether universal negro suffrage should be placed beyond the power of States to repeal it by a new constitutional amendment, the platform declared. "The guarantee by Congress of equal suffrage to all loyal men at the South was demanded by every consideration of public safety, of gratitude and of justice, and must be maintained; while the question of suffrage in all the loyal states properly belongs to the people of those states." Nowhere in the North was the negro an important element in the population, but the North had shown an unwillingness to apply to itself the doctrines of negro rights which had been imposed upon the South. Between 1865 and 1868 Connecticut, Wisconsin, Minnesota, Kansas, Ohio and Michigan had refused to give the negro the right to vote within their own bounds, and this plank was evidence of the unwillingness of the party to make a direct issue of universal negro suffrage. The platform pronounced in favour of payment of the public debt, not only according to the letter but the spirit of the laws under which it was contracted. The significance of this lay in its challenge to the Democratic agitation on the currency question.

It was this question which gave the tone to the proceedings of the Democracy at their convention in July 1868 The situation can best be presented by a brief review of the financial history just preceding the convention. Together with the discussion over political reconstruction in the South, Congress and the Administration had been obliged to deal with the reconstruction of debt, taxation and currency in the nation at the close of four years of expensive war The problems of funding, readjustment of taxation, and resumption of specie payments proved to be so complicated with the industrial growth of the nation that they led to issues destined to exert a long-continued influence.

Finance.—The various war tariffs, passed primarily for the sake of increased revenue, had been shaped for protection under the influence of the manufacturing interests, and they had been framed also with reference to the need of compensating the heavy internal taxes which were imposed upon the manufacturers. When the war ended, public sentiment demanded relief from these heavy burdens, especially from the irksome internal taxes. The rapidly growing grain-raising districts of the Middle West exhibited a lively discontent with the protective tariff, but this did not prevent the passage in 1867 of the Wool and Woollens Act, which discriminated in favour of the woollen manufacturers and raised the *ad valorem* duty on wool. In spite of several large reductions of internal revenue, the national debt was being rapidly extinguished.

The currency question, however, furnished the economic issue which was most debated. One set of interests aimed at rapidly reducing the volume of the currency by retiring the legal tender notes, or "greenbacks" The secretary of the Treasury, Hugh McCulloch, pressed this policy to the foreground, and desired authority to issue bonds to retire these notes. Another set of interests demanded the retention of the greenbacks, supporting their views by arguments varying according to the degree of radicalism of the speakers The more moderate, like Senator John Sherman, of Ohio, who reflected the views of parts of the West, argued that the recuperation of the nation and the rapid increase of business would absorb the existing currency, while gold would cease to go abroad Thus, by the increasing credit of the Government, specie payment would be automatically resumed The most extreme, so far from contracting the currency by retiring the greenbacks, wished to increase this form of money, while diminishing the circulation of the notes of the national banks. The discussion tended to produce a sectional issue with the West against the East, and a social issue with bondholders

and the creditor class in general arrayed against the less well-to-do Congress agreed with Secretary McCulloch, and in the Funding Act of 1866 not only provided for converting short-time securities into long-term bonds, but also for retiring $10,000,000 of greenbacks in six months and thereafter not more than $4,000,000 monthly. But the agricultural depression of 1866 produced a reaction. Loud demands were made that bonds should be paid in greenbacks instead of coin and the national banknotes suppressed. In 1868, on the eve of the presidential campaign, Congress, alarmed by the extent of these popular demands, suspended the process of contraction after $40,000,000 in greenbacks had been retired Ohio was the storm centre of the agitation. The "Ohio idea" that greenbacks should become the accepted currency of the country was championed by George H. Pendleton, of that State, and his friends now brought him forward for the Democratic nomination for President on this issue. In the national convention of that party they succeeded in incorporating into the platform their demands that there should be one currency for the Government and the people, the bondholder and the producer, and that where the obligations of the Government did not expressly provide for payment in coin, they should be paid in lawful money (*i.e.*, greenbacks) of the United States.

But another wing of the Democratic Party desired to make prominent the issue against the reconstruction measures of the Republicans. This wing added to the platform and declaration that these acts were unconstitutional and void, and the demand that the Southern States should be restored to their former rights and given control over their own elective franchise.

Democrats Nominate Seymour.—Although the followers of Pendleton had shaped the financial plank of the platform, they could not nominate their leader. The opposition was at first divided between the various candidates. New York, which feared the effect upon the conservative financial interests of the East if Pendleton were nominated, attempted to break the deadlock by proposing an Ohio man, Chief Justice Chase. But eager as Chase was for the Presidency he had flatly refused to abandon the views which he held in favour of negro suffrage. Ohio was, therefore, able to retaliate by stampeding the convention in favour of Horatio Seymour, of New York As the war governor of his State he had been a consistent critic of the extremes to which the Federal Administration had carried its interpretation of the war power. For vice-president the convention nominated Francis P. Blair, jun., of Missouri.

Grant Elected.—But the popularity of Grant in the North, together with the Republican strength in the States of the South which had been reconstructed under negro suffrage, gave an easy victory to the Republicans in the election of 1868. Seymour carried only Delaware, New Jersey, New York and Oregon, of the North; and Maryland, Kentucky, Georgia and Louisiana of the South. Tennessee, and five of the former Confederate States, upon which negro suffrage had been imposed (North Carolina, South Carolina, Florida, Alabama and Arkansas) voted for Grant. Virginia, Mississippi and Texas had not yet been restored.

Fifteenth Amendment.—This decisive victory and the knowledge that it had been won by the advantage of the negro vote in the restored States led the Republican leaders to ignore their recent platform declaration in regard to negro suffrage. Shortly after Congress assembled propositions were made to place the freedman's right to vote beyond the power of the States to change To do this by constitutional enactment it was necessary to make the provision universal, and Congress, therefore, submitted for ratification the 15th amendment declaring that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color or previous condition of servitude." Congress was given power to enforce the amendment by appropriate legislation. By March 30, 1870, the amendment had been ratified; but it is doubtful whether this could have been accomplished by legislatures chosen on the issue. As it was, the States of Virginia, Mississippi, Texas and Georgia were required to ratify it as a condition of their readmittance to representation in Congress, and the three former States, having been permitted to vote separately on the obnoxious provisions of their Constitutions in regard to the disfranchisement of former Confederates, rejected those clauses, adopted the 15th amendment and were restored in 1870. Georgia, after a new experience of military rule, likewise ratified the amendment, and her representatives were likewise admitted to Congress.

As soon as the 15th amendment was proclaimed in effect, and the military Governments of the South were superseded, the dominant party proceeded to enact measures of enforcement These seemed especially necessary in view of the fact that, partly by intimidation of the coloured vote, Louisiana (1868) and Tennessee (1869) broke away from the Republican column; while in the election of 1870 Tennessee, North Carolina, Georgia, Virginia and Alabama went Democratic The enforcement legislation of 1870 provided penalties for violating the 14th and 15th amendments and re-enacted the Civil Rights Act of 1866. In the years 1871 and 1872 acts were passed providing for effective Federal supervision of Congressional elections, and the "Ku-Klux Acts" (1871 and 1872) still further increased the power of the Federal courts to enforce the amendments and authorized the President to suspend the writ of *habeas corpus* and use military force to suppress public disorders. But these stern measures were accompanied by some efforts to restore harmony, such as the repeal of the "iron-clad oath" for ex-Confederates, in 1871, and the passage of the General Amnesty Act of 1872. The North was becoming restive under the long-continued use of the Federal military arm within State borders in time of peace.

Reconstruction Governments.—In any case the cost of rehabilitating the public works and providing education and the political and judicial institutions which should apply equally to the hitherto non-political class of the blacks, would have been a heavy one But the legislatures, especially of Louisiana, South Carolina, Tennessee, Arkansas and Alabama, plunged into an extravagance made possible by the fact that the legislatures contained but few representatives who paid considerable taxes. In 1872 it was estimated that the public debts of the 11 reconstructed States amounted to nearly $132,000,000, two-thirds of which was composed of guarantees to corporations. Legislative expenses were grotesquely extravagant, the coloured members in some States engaging in a saturnalia of corrupt expenditure. This alienated from the so-called Radical Party the support of Southern whites, because they resented the concessions of the carpet-bag leaders to the negro vote, because they suffered from the burden of taxation, and above all because race friction increased.

By 1872 a coalition had been formed under the name of Conservatives. But the control of electoral machinery in the strongly centralized State executives chosen by negro votes, and coercion by the Federal authority, still upheld Republican rule in various Southern States Virginia and North Carolina were practically bankrupt, the capitals of Louisiana, Arkansas and Alabama, where rival State officers claimed possession, were occupied by Federal troops, and many of the Governments were so corrupt that only the contemporaneous rottenness in New York City and in certain branches of the Federal Government afford a parallel.

It was a time of lax public morals after war, which was ill suited to the difficult experiment of transferring political power to a race recently enslaved Only the strong arm of the Federal authority sufficed to prevent the whites of the South from overthrowing a condition of things which it was impossible under American political ideas permanently to maintain.

Southern Changes.—An important economic reorganization was in progress in the South. White districts were recovering from the war and were becoming the productive cotton areas by the use of fertilizers and by the more intelligent white labour. Cities were rising, and the mines and manufactures of the southern Appalachians were developing. In the black belt, or region of denser negro settlement the blacks became tenant farmers, or workers on shares. The effective and just direction of negro labour was a difficult problem and was aggravated by the political agitation which intensified race friction. It became evident that there was a negro problem as well as a slavery question, and that the North was unable to solve it.

Foreign Relations.—In the meantime important foreign relations had been dealt with by Secretary William H. Seward, under Johnson, and by Secretary Hamilton Fish, under Grant Not only were many treaties of commerce and extradition, including one with China, negotiated by Seward, but he also brought about a solution of more important diplomatic problems. The relations of the United States with France and England had been strained in the course of the war. Not only had Napoleon III been inclined to recognize the Confederacy, but he had also taken advantage of the war to throw into Mexico a French army in support of the Emperor Maximilian The temptation to use force while American military prestige was high appealed even to Gen. Grant; but Seward by firm and cautious diplomatic pressure induced France to withdraw her troops in 1867, and the power of Maximilian collapsed Russia's friendly attitude throughout the war was signalized by her offer to sell Alaska to the United States in 1867. Seward promptly accepted it and the treaty was ratified by the Senate and the purchase money ($7,200,000) was voted by the reluctant House, which saw little in the acquisition to commend it.

"Alabama" Claims.—With England, affairs were even more threatening than with France Confederate cruisers (notably the "Alabama"), built in England and permitted by the negligence of the British Government to go to sea, had nearly swept the American merchant marine from the ocean. Unsettled questions of boundary and the fisheries aggravated the ill feeling, and England's refusal in 1865 to arbitrate made a serious situation Prolonged negotiations followed a change of attitude of England with regard to arbitration, and in 1870 President Grant recommended to Congress that the United States should pay the claims for damages of the Confederate cruisers, and thus assume them against England. However, in 1871, the Treaty of Washington was negotiated under Secretary Fish, by the terms of which England expressed regret for the escape of the cruisers and provided for arbitration of the fisheries, the north-western boundary, and the "Alabama" claims The case of the United States was victorious, the tribunal awarding damages against Great Britain to the amount of $15,500,000 Two months later the German emperor gave to the United States the disputed north-west boundary, including the San Juan island in Puget sound.

In the West Indies also important questions were presented. Seward had negotiated a treaty of purchase of the Danish West Indies, but the Senate refused to ratify it, nor did Grant's attempt to acquire Santo Domingo meet with a different fate at the hands of that body (1870). In Cuba another insurrection was in progress. Secretary Fish "pigeon-holed" a proclamation of President Grant recognizing the Cubans as belligerents, and secured a policy of neutrality which endured even the shock of the "Virginius affair" in 1873, when 50 of the men of the filibustering steamer flying the American flag were shot by the Spanish authorities. It was shown that the vessel had no right to the flag Negotiations for an isthmian canal resulted only in a treaty with Nicaragua in 1868 giving to the United States a right of way across the isthmus and providing for a Government survey of the Panama route.

It was in the field of domestic concerns, in economic and social development, that the most significant tendencies appeared. The old issues were already diminishing in importance before the other aspect of reconstruction which came from the revived expansion of the nation toward the West and the new forms taken by the development of American industrial society.

Finance.—The Republican Party, following the traditions of the Whigs, was especially responsive to the demands of the creditor class, who demanded legislation to conserve their interests. Its victory in 1868 was signalized by the passage in the spring of the following year of an act pledging the faith of the United States to pay in coin or its equivalent all the obligations of the United States, except in cases where the law authorizing the issue had expressly provided otherwise. In 1870 and 1871 refunding acts were passed, providing for the issue of bonds to the total amount of $1,800,000,000, one billion of which was to run for 30 years at 4%. This abandonment of the doctrine of early convertibility was made in order to render the bonds acceptable to capitalists, but in fact they soon went to a premium of over 25%

While the legislature was thus scrupulous of the credit of the nation and responsive to the views of capital, the Supreme Court was engaged in deciding the question of whether the legal tender notes (greenbacks) were constitutional Successive decisions in 1868 determined that they were not legal in certain cases In these decisions the judges had divided, four to three. Within a year the court was changed by the appointment of one new judge to fill a vacancy, and the addition of another in accordance with a law enlarging the court In 1871 the former decision was reversed and the constitutionality of the Legal Tender Acts sustained on loose-construction reasoning. In 1884 the court went to the extent of affirming the right of Congress to pass legal tender acts in time of peace In 1871 and 1872 Secretary George S. Boutwell illustrated the power of the Administration to change the volume of the currency, by issuing in all over $6,000,000 of legal tender notes; and, following the practice of his predecessors, he sold gold from the Treasury to check speculations in that part of the currency.

Economic Changes.—Speculation and the rapid growth of great fortunes were characteristic of the period. The war itself had furnished means for acquiring sudden riches; the reorganization of taxation, currency and banking increased the opportunities; and the opening of new fields of speculative enterprise in the oil fields of Pennsylvania and Ohio and the gold and silver mines of the mountains of the Far West tended in the same direction An enormous development of manufactures resulted from the diminished commerce and increased demand for manufactured goods, the protection afforded by the tariff, the stimulus due to rising prices, and the consumption of the rapidly growing West It was officially reported in 1869 that "within five years more cotton spindles had been put in motion, more iron furnaces erected, more iron smelted, more bars rolled, more steel made, more coal and copper mined, more lumber sawn and hewn, more houses and shops constructed, more manufactories of different kinds started, and more petroleum collected, refined and exported, than during any equal period in the history of the country."

Pacific Railways.—Between the Civil War and 1872, the extension of the nation's activity to the industrial conquest of the great West, as well as the economic reorganization of the East, had a profound effect upon the development of the United States. Between 1862 and 1872 grants were made to the Union Pacific and Central Pacific companies, and to other connecting corporations, for railways from the Missouri to the Pacific, amounting to nearly 33,000,000ac., and in the same period large loans of funds were made by the general Government for this enterprise. Construction advanced rapidly after 1866, and by 1869 an all-rail connection had been established on the line of the Union Pacific and Central Pacific railways between the East and San Francisco Various grants were made in these years to other roads, both trans-continental and Middle Western Between 1850 and 1871 Congress granted about 155,000,000ac. for railway construction, but not all these grants were perfected It is estimated that some $500,000,000 were invested in the construction of Western railways between 1868 and the panic of 1873, and about 30,000m. of railway had been added.

The effects of this extraordinary extension of railway transportation were immediately apparent. In the Far West the railway lines rapidly made possible the extinction of the bison herds. This opened the way for the great extension of the cattle country, following the retreat of the Indians. Upon the plains Indians the effect was revolutionary. Their domain had been penetrated by the railways at the same time that their means of subsistence had been withdrawn. During the Civil War most of these Western tribes had engaged in hostilities against the Federal Government. By the Peace Commission Act of July 20, 1867, commissioners, including Gen. William T. Sherman, were sent to negotiate treaties. As a result the tribes of the Indian Territory were so concentrated as to permit the transfer of other Western tribes to the same region, while the Sioux of the northern plains were given a reservation embracing the western portions of the Dakotas Discontent with these treaties resulted, however, in hostilities following 1867. Between the close of the war and 1880 some $22,000,000

were expended in Indian wars, although the act of 1871 inaugurated the change of policy whereby the Indians were no longer dealt with by treaty, but were regarded as wards of the nation, to be concentrated on reservations and fed at the expense of the nation under the supervision of Indian agents.

Mining.—Part of these Indian difficulties were due to the opening up of new mining areas in the Rocky Mountains, some of them within the Indians' choicest hunting-grounds. At the beginning of the Civil War a preliminary mining boom struck Colorado, the rich Comstock lode was opened in Nevada; Arizona was the scene of mining rushes; the Idaho mines were entered; and the Montana ores were discovered, so that in the period of the Civil War itself the Territories of Nevada, Idaho and Montana had been organized The discovery of gold in the Black Hills in 1874 continued the same movement In 1860 the nation produced $156,000 worth of silver, in 1861 over $2,000,000 and in 1873 nearly $36,000,000. Capital in mines and quarries of the United States was over $65,000,000 in 1860, over $245,000,000 in 1870, and nearly $1,500,000,000 in 1880.

The Middle West.—This revolution in the life of the great plains and the Rocky Mountains, opening the way to agriculture and to cattle raising, and preparing for the exploitation of the precious metals of that great area, was contemporaneous with the important development of the farming regions of the Middle West Even during the Civil War the agricultural development of the northern half of the Mississippi valley had continued This was aided by the demand for food products to supply the armies and was made possible by the extension of railways, the taking up of the prairie lands through the operation of the homestead law of 1862, the marketing of the railway land grants, and the increased use of agricultural machinery in those years. Between 1860 and 1870 the population of the North Central group of States increased over 42%, and in the next decade by 34%, a total addition to the population in those two decades of 8,000,000 Between 1870 and 1880 about 200,000sq.m were added to the farm lands of the United States, an area almost equal in extent to that of France In the same decade the North Central States increased their improved farms from near 78,500,000ac. to over 136,800,000 acres. The production of Indian corn about doubled between 1860 and 1880, and that of wheat and oats more than doubled The addition came chiefly from the Middle West

Railway Scandals.—The pressing need of increased transportation facilities had led, as we have seen, to lavish land grants and to subsidies by nation, States and municipalities to the railways. The railways themselves, tempted by these opportunities, had extended their lines in some cases beyond the immediate needs of the regions. Extravagances in construction and operation, aggravated by "construction rings" of railway officials and by rolling stock companies who received extravagant prices by favouritism, brought about a condition where the roads were no longer able to meet the demands of their stockholders for returns on the investment without imposing rates that the Western farmer deemed extortionate. In the competitive development of these roads and in the struggle of business corporations and localities with each other, the roads also discriminated between persons and places. This condition chiefly accounted for the political unrest which manifested itself in the West in the so-called "Granger" movements of the '70s

"Granger" Movement.—The farmers felt the pressure of the unsettled currency, taxes were very heavy, the protective tariff seemed to them to bear unduly upon the producers of crops which exceeded the home consumption and had to seek the foreign markets. The price of Indian corn, wheat and cotton in the early '70s tended to fall as production rose, so that the gold value of the total crop was not greatly increased during the decade after the war, in spite of increase of production Dissatisfaction with their share in the prosperity of the country, and especially with the charges of middlemen and transportation companies, discontent with the backwardness of rural social conditions, and a desire for larger political influence, all aided in fostering the growth of organizations designed to promote the farmers' interests. The most influential of these organizations was the Patrons of Husbandry, which was founded in 1867 and spread chiefly after 1872 by local clubs or "granges," especially in the West and South.

The height of the movement was reached in the autumn of 1874. It threatened the disruption of the old political parties in most of the Middle Western States By holding the balance of power the Grangers secured legislation in many of these States, fixed maximum railway rates, and provided for regulation through commissions. In the reaction after the panic of 1873 (when nearly a fifth of the railway mileage of the United States had passed into the hands of receivers) many of the "Granger laws" were repealed, the regulation was rendered nominal and the railways more than regained their political power, yet the agitation had established the important principle, sanctioned by decisions of the Supreme Court, that the railways were common carriers subject fully to public regulation so far as it was not confiscatory. The movement for regulation of interstate commerce by congressional legislation was begun at this time under the leadership of congressmen from the Granger States. Later efforts were more wisely considered and more effective; but the rural democracy showed its opposition to the increasing political influence of capital, to special privileges and to the attempts of corporations to avoid public control periodically thereafter

Tweed Ring.—The presidential election of 1872 took place in the midst of this Western upheaval. At the same time in the South the reform Republicans and Democrats were uniting under the name of "Conservatives" against the carpet-bag rule, and control was passing into their hands A reform movement was active against the evident corruption in national and municipal administrations, for Grant's trust in his appointees was grossly violated The Tweed ring was systematically looting New York city, and prior to Tweed's indictment in 1871 it was acquiring large power in State legislation Civil service reformers, men of moderate views with respect to reconstruction, many war Democrats who had adhered to the Union Party, and tariff reformers began to break away

Grant Re-elected.—The Liberal-Republican movement started in Missouri, and a national convention was called to meet at Cincinnati on May 1, 1872. Their platform attacked the corruption of civil service by the Administration, supported the results of the war as embodied in the last three amendments and demanded amnesty and local civil government for the South It opposed further land grants to railways, but denounced repudiation and demanded specie payments in terms which excluded from its support the advocates of inflation of the currency. This effort to combine the opponents of Grant's Administration was wrecked by the nomination of Horace Greeley, a strong protectionist, who did not command the confidence of the masses of the disaffected. Although endorsed by the Democrats, Greeley was defeated by Grant, who ran on the record of the Republican Party, which now dropped the word Union from its name. Greeley died before the electoral count; the Democrats won only the States of Maryland, Kentucky, Missouri, Tennessee, Georgia and Texas, the votes of Louisiana and Arkansas being thrown out

Panic of 1873.—The enormous cost of the war, the excessive railway building, over-trading, and inflated credit and fluctuating currency, the sinking of capital in opening new farming lands and in readjusting manufactures to new conditions brought their results in the panic of 1873, precipitated by the failure (Sept. 18) of Jay Cooke, the financier of the Northern Pacific railway. For over five years the nation underwent a drastic purgation; railway building almost ceased, and so late as 1877 over 18% of the railway mileage of the nation was in the hands of receivers. The iron industry was prostrated, and mercantile failures for four years amounted to $775,000,000. At the close of the period there was a replacement of partnerships and individual businesses by corporations, but in the interval political unrest was in the foreground

Crédit Mobilier.—The charges that congressmen had been bribed by stock in the Crédit Mobilier, a construction company controlled by Union Pacific stockholders, led to a congressional investigation which damaged the reputations of prominent Republicans, including Vice President Schuyler Colfax; but the same Congress which investigated this scandal voted itself retroactive

increases of salary, and this "back-pay grab" created popular indignation. Evidences of fraud and corruption in revenue collection under the "moiety system," and the general demoralization of the civil service continued The demand for relief from the stringency of the crisis of 1873 expressed itself in the so-called Inflation Bill (passed April 1874) providing a maximum of $400,000,000 for greenback issues This was vetoed by Grant, but he later signed a bill accepting as a maximum the existing greenback circulation of $382,000,000. This compromise was satisfactory neither to contractionists nor greenbackers

Republicans Lose Congress.—The "tidal wave" in the congressional elections of 1874 was the result of these conditions It marked a political revolution. The House of Representatives, which exhibited a two-thirds Republican majority in 1872, showed an opposition majority of about 70, and the Senate was soon to be close. Such Republican strongholds as Pennsylvania, Ohio and Massachusetts went over to the Democrats in the State elections, while in the grain-raising States of the Middle West the Grangers were holding the balance of power, and in the South the Republican Radicals remained in force in few States and only by the use of Federal troops. President Grant in his message of Dec. 1874 acknowledged that public opinion was opposed to this use of force, but declared that without it negro suffrage would be worse than a mockery. Thus by the year 1874 the era of triumphant Republicanism and reconstruction was closing The leaders perceiving power about to pass from them rapidly enacted a series of party measures before the meeting of the newly elected Congress Under the leadership of Senator John Sherman an act was passed (Jan 14, 1875) providing for resumption of specie payments on Jan. 1, 1879, gradually contracting greenbacks to $300,000,000 and compensating this by expanding the circulation of the national banks.

In the field of the tariff a similar policy was followed. The act of 1870 had somewhat reduced duties on tea, coffee, sugar and iron; but under Western pressure in 1872 the Republican Congress had consented to a 10% reduction on most classes of goods in order to save the general system of protection On the eve of their relinquishment of full power the Republicans (March 3, 1875) repealed the Tariff Act of 1872, increased the duties on molasses and sugar and increased the revenue tax on tobacco and spirits Thus the tariff was restored to the war basis, before the incoming Democratic House could block the advance. Similarly on March 1 Congress passed a Civil Rights Act, milder than the measure for which Sumner had fought so long, guaranteeing equal rights to the negroes in hotels, public conveyances, and places of amusement and forbidding the exclusion of them from juries. An effort to pass a new force bill levelled against the intimidation of negro voters failed By these measures the Republicans placed the important features of their policy where they could be overturned only by a Democratic capture of Presidency and Senate.

Supreme Court Decisions.—In the midst of these changes the Supreme Court handed down decisions undoing important portions of the reconstruction system by restraining the tendency of the nation to encroach on the sphere of the State; and restricting the scope of the recent constitutional amendments. On April 14, 1873, in the Slaughter House cases, the courts held that the amendments were primarily restrictions upon the States for the protection of the freedom of the coloured man, rather than extensions of the power of the Federal Government under the definition of United States citizenship, and that general fundamental civil rights remained under State protection. In the case of the United States v. Reese, decided March 27, 1876, the court declared parts of the act of 1870 (which provided for the use of Federal force to protect the negro in his right to vote) unconstitutional, on the ground that they did not specify that the denial of suffrage must be on the sole ground of race or colour. A reasonable pre-requisite, such as a poll-tax, for voting was permissible. The South later took advantage of this decision to restrain negro suffrage indirectly. In United States v. Cruikshank (1876) the court held that the amendments to the Constitution left it still the duty of the State, rather than of the United States, to protect its citizens, even when whites had mobbed the negroes. In 1883 the court declared the conspiracy clause of the Ku-Klux Act unconstitutional and restricted the application of the law to acts of a State through its officers and not to private citizens. In the same year it declared the Civil Rights Act of 1875 invalid.

In 1875 President Grant refused the appeal of the "carpet-bagger" Gov Adelbert Ames of Mississippi to be supported by troops, whereupon Ames resigned his office into the hands of the Conservatives The Mississippi plan of general intimidation of negroes to keep them from the polls was followed in Louisiana, South Carolina and Florida which alone remained Republican Thus steadily the radical reconstruction policy and Republican control of the South were being reversed It was made clear that negro suffrage could be enforced upon the South only by military rule which could no longer command Northern sympathy or the sanction of the Federal court. Northern interest increasingly turned to other issues, and especially to discontent over administrative corruption.

Corruption.—The spoils system had triumphed over the advocates of civil service reform to such an extent that Grant abandoned the competitive system in 1875 on the ground that Congress did not support him in the policy Enormous frauds in the collection of the internal revenue by the whisky ring with the connivance of Federal officials were revealed in 1875, and at about the same time, secretary of War William W. Belknap resigned to avoid impeachment for corruption in the conduct of Indian affairs. The enforced resignation in 1876 of secretary of the Treasury Benjamin H Bristow, after he had successfully exposed the whisky ring, and of postmaster-general Marshall Jewell, who had resisted the spoils system in his department, tended to discredit the Administration. Blaine, the leader of the Republicans in the House of Representatives, fell under suspicion on account of his earlier relations with the Little Rock and Fort Smith and Northern Pacific railways, which left it doubtful, in spite of his aggressive defence, whether he had not used his influence as Speaker in previous Congresses to secure pecuniary advantages from land grant railways.

Campaign of 1876.—Thus the campaign of 1876 approached, with the Republicans divided into (1) steadfast supporters of the Grant Administration, (2) a discontented reform wing (which favoured ex-Secretary Bristow), and (3) an intermediate group which followed Blaine. This statesman made a bold stroke to shift the fighting which the Democrats planned to make against the scandals of the Administration, to the old-time war issues. By proposing to exclude Jefferson Davis from amnesty, he goaded Southern congressmen into indiscreet utterances which fanned anew the fires of sectional animosity A compromise candidate was selected in the person of Gov. Rutherford B Hayes, of Ohio, who had vigorously opposed the greenback movement in his State, and whose life and character, though little known to the general public, made him acceptable to the reform leaders of the party. The Democrats, demanding reform, economy, a revenue tariff and the repeal of the resumption clause of the act of 1875, chose the reform governor of New York, Samuel J. Tilden, as their candidate. The Independent National, or Greenback, Party, which was to develop rapidly in the next two years, nominated Peter Cooper, a New York philanthropist, and demanded the repeal of the Resumption Act, and the enactment of a law providing a paper currency.

Hayes Elected.—The election proved to be a very close contest. Tilden, according to the count of both parties, had a plurality of over 250,000 votes, and at first the leading Republican journals conceded his election He had carried New York, Indiana, New Jersey and Connecticut and, by the Democratic count, the solid South But the Republican headquarters claimed the election of Hayes by one electoral vote, based on the belief that the States of South Carolina, Florida and Louisiana had gone Republican. Since these States were in the midst of the transition from negro to white Government, and elections were notorious for fraudulent practices, a serious question was raised, first as to the proper authority to count the electoral vote, and second, how far it was permissible to go behind the returns of the State authorities to ascertain the validity of the canvass of the votes in the

State The political capacity and moderation of the nation were severely tested; but in the end a characteristic American solution was found by the creation of an electoral commission in which five associate justices of the Supreme Court were joined with an equal number of representatives from each of the two houses of Congress The result was that this commission refused to "go behind the returns," and Hayes was declared elected by one vote. To prevent the threatened danger of a filibuster by Democrats of the House of Representatives against the completion of the count until after legal date for the inauguration of the President, Hayes's friends agreed with leading Democrats that he would withdraw the Federal troops from Louisiana.

Thus a new era began under a moderate and reforming Republican President, a close Republican Senate and a Democratic House of Representatives The Southern question was not settled, but other issues of an economic and social nature increasingly forced themselves to the front During the dozen years that followed Hayes's inauguration neither party held complete possession of both the executive and the two houses of Congress. His own moderate character, the conditions of his election and the check imposed during the first two years by a Democratic House of Representatives (and during the second two years by an opposition in both houses) made the period of Hayes's Administration a transition from the era of reconstruction to the era of dominant economic and reform agitation.

When he withdrew the troops which sustained the Republican Governments in Louisiana and South Carolina, those States returned to the rule of the white Democrats. In the Congress elected in 1878 the former slave States chose 101 Democrats to the House of Representatives and only four Republicans. Leading Republicans like Blaine protested vigorously against the policy, declaring that the men who saved the Union should govern it; and on the other hand the Democrats in Congress added "riders" to appropriation bills designed to starve the Administration into complete cessation of the use of troops and Federal deputy marshals at Southern elections. Due to this policy extra sessions had to be summoned in 1877 and 1879 to provide supplies for the Government. Hayes assisted his party by vetoing these coercive attempts of the Democrats and it was not until later that Federal attempts to supervise Southern elections entirely ceased.

Civil Service Reform.—As his early policy toward the South had dissatisfied many of the leaders of his party, his opposition to the spoils system alienated others. In 1877 a Civil Service Reform Association was formed in New York and extended to other States. In June 1877 President Hayes issued an executive order against the participation of Federal officers in political management, and he furnished evidence of his sincerity by removing Alonzo B. Cornell, the naval officer of New York, who was also chairman of both State and national Republican committees, and Chester A. Arthur, collector of the port of New York. As both were friends of Senator Roscoe Conkling of that State, the leader of the Grant men, this was a bold challenge. The "Stalwarts" answered it by securing the nomination of Cornell as governor of New York and Arthur as vice-president of the United States.

Finances.—The monetary question rose to primary importance at this time. Hayes himself had campaigned in Ohio successfully against the greenback movement, and he chose as his secretary of the Treasury, John Sherman, whose long service as chairman of the finance committee had made him familiar with conditions and influential with moderate men. The *per capita* circulation of the nation had fallen from $20.57 in 1865 to $15 58 in 1877 and was still declining. The remarkable increase in the production of silver, as the new mining regions were opened, was accompanied by a fall in its ratio to gold from 15 to one in 1860 to 17 to one in 1877. Congress had, in 1873, passed an act dropping the standard silver dollar from the list of coins; but though the significance of this omission of a coin not widely circulated passed almost unnoticed at the moment, the demonetization of silver was afterward stigmatized as a conspiracy, "the crime of 1873." As the date (Jan. 1, 1879) for the redemption of the greenbacks in specie approached, demands were renewed for the replacement of national bank-notes by greenbacks, for the postponement, or abandonment of resumption, for the free coinage of silver, and for the use of silver as well as gold in payment of bonds redeemable in "coin." Sectional grouping of debtor against creditor regions, rather than party alignment, showed itself in the votes, for each party had its "soft money" as well as "hard money" followers.

A monetary commission, appointed in 1876, reported in 1877, but without agreement or real influence upon the country. The president took strong ground against free coinage and against the payment of bonds in silver; but the House of Representatives passed the measure, known as the Bland bill, for the free coinage of silver, by a vote of 163 to 34. In the Senate this was amended and as it finally passed both houses it was known as the Bland-Allison Act after the two leaders, the Democratic representative from Missouri and the Republican senator from Iowa. This compromise was carried over the veto of President Hayes and became a law Feb. 28, 1878. In the vote of Feb. 15, all but one of the senators from New England, New York and New Jersey opposed it, while the States west of the Alleghenies furnished only four opposing votes. The law restored the legal tender character of the silver dollar and authorized the secretary of the Treasury to buy silver bullion at the market price, to an amount of not less than $2,000,000 nor more than $4,000,000 per month, and to coin the bullion into silver dollars.

Hardly had the Bland-Allison compromise been effected on the silver issue when an act was passed (May 31, 1878) forbidding the further retirement of greenbacks, which remained at $346,681,000. Substantially the same sectional alignment was followed in the vote on this bill as in the silver votes. Not satisfied with this legislation, nearly 1,000,000 voters cast their ballots for Greenback Party candidates at the congressional elections in the autumn of 1878. The preparations of Secretary Sherman had been so carefully made, and the turning tide of trade brought coin so freely to the United States, that before the date of resumption of specie payments a gold reserve had been accumulated to the amount of $133,000,000 in excess of matured liabilities and the greenbacks rose to par before the date of redemption.

Election of 1880.—In the campaign of 1880, Hayes and Tilden both declined to stand for renomination. Thus the issue of the "fraud of 1876," which the Democratic platform called the paramount issue, was subordinated. Nor was it possible for the Republicans to force the tariff question into a commanding position, for although the Democratic platform declared for a tariff for revenue only, a considerable wing of that party led by Samuel J Randall, of Pennsylvania, favoured protection. Gen. Winfield S. Hancock, a distinguished soldier in the Civil War, whose nomination for the Presidency by the Democrats was designed to allay Northern distrust, refused to make the tariff a national issue. The recent adjustment of the monetary question and return of prosperity relegated the discussion of the currency also to a subordinate place.

The Republicans, after a heated convention in which the followers of Grant, Blaine and Sherman, fought each other to a deadlock, selected Gen. James A. Garfield of Ohio, who was political manager for Sherman in the convention. This was a blow to the Grant, or "Stalwart" wing, which was, however, partly placated by the nomination of Arthur for the vice-presidency. Garfield's popular plurality was only a little over 9,000 out of a total vote of over 9,000,000; but his electoral vote was 214 to Hancock's 155. The area of the former slave States marked the boundaries between the Republican and the Democratic States, except that Hancock also carried New Jersey, Nevada and California. The Republicans won the elections for the House of Representatives which would meet in 1881, and the Senate was at first nearly evenly divided, two independents holding the balance. In the ensuing four years party lines were badly broken, factions made bitter war upon each other, and the independent reformers or "Mugwumps" grew in numbers. The selection of Blaine as secretary of State committed Garfield to the anti-Grant wing, and the breach was widened by his appointment of the collector of the port of New York against the protests of Roscoe Conkling and Thomas C. Platt, the "Stalwart" senators from New York. They resigned, then sought re-election in order to vindicate the right of senatorial recommendation; but were defeated.

Garfield Assassinated.—In the midst of this excitement the President was assassinated by a disappointed office-seeker of unsound mind. Vice-President Arthur, who succeeded Garfield in Sept. 1881, by his tact and moderation won the admiration of former opponents; but the bad crops in 1881 and the dissatisfaction with boss rule among independent voters caused a Democratic victory in the congressional campaign of 1882.

Legislative Acts.—Garfield's assassination had given new impetus to the movement against the spoils system, a National Civil Service Reform League had been organized in 1881, President Arthur presented the question in his message of December of that year, and in 1882 George H. Pendleton, a Democratic senator from Ohio, urged the subject upon the attention of Congress. Stimulated by the elections of 1882 Congress passed an act (Jan. 16, 1883) authorizing the President to appoint a commission to classify certain of the Federal employees, and providing for appointment and promotion within this classified list by competitive examination. Congressional recommendations for these offices were not to be received, and political assessments for campaign purposes were forbidden This was an effective beginning in the purification of the civil service; but the evil of assessment of employees was succeeded by the evil of soliciting campaign contributions from corporations interested in legislation. The extension of the competitive list proceeded gradually through succeeding Administrations. The Edmunds Anti-Polygamy Act (1882) was levelled at the Mormons and the Chinese Exclusion Act was passed at the demand of labour, after a long agitation in 1882, the way having been prepared by the Treaty of Peking in 1880. Bills to this effect had been vetoed by Hayes and Arthur as violative of international agreement, but the desire of the politicians to win the California vote, and the compromise by which the exclusion was limited to ten years finally carried the measure, and the Supreme Court (1889) held it constitutional

Surplus Revenues.—From 1879 to 1890 the Treasury showed a surplus of revenue over expenditure. This furnishes the explanation of much of the legislation of that period. It led to extravagant appropriations, such as the Arrears of Pensions Act of 1879, and the River and Harbor Act of 1882 providing for the expenditure of more than $18,000,000 which was passed over the veto of Arthur. Appropriation bills were merely constructed in various committees of Congress under a system of bargaining between interests and sections with primary reference to the political fortunes of the congressmen.

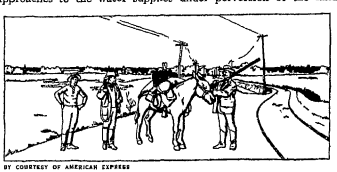
The surplus also strengthened the demand for a reduction of the tariff. A tariff commission, composed of men friendly to protection, appointed in 1882, proposed an average reduction of 20 to 25%. Nevertheless, in the act as passed in 1883 duties were increased in general on those protected articles which continued to be imported in large volume, especially on certain woollen goods and about two-thirds of the imported cotton goods, and on iron ore and some steel products, while they were lowered on finer grades of wool and cheaper grades of woollen and cotton fabrics, etc. It was unsatisfactory to large portions of both parties and did not materially lower the revenue; but the act of 1883 made extensive reductions in internal taxes As the Senate had just fallen into the hands of the Republicans, and the House would not become Democratic until the new Congress met, this protective law gave the Republicans the advantage of position. Moreover, the Democrats were themselves divided, 19 Representatives voting with the Republicans on the act of 1883. In the next Congress (1884), when the leaders made an attempt to rally the Democrats to show their position by passing a bill for a horizontal reduction of 20% in general, 41 Democrats voted against the bill and prevented its passage through the House.

Election of 1884.—Thus the campaign of 1884 found both parties still lacking unity of policy although it seemed possible that the tariff might become the touchstone of the contest. The Republicans challenged the independents by nominating Blaine, whose record was objectionable to many reformers, and who had been chiefly identified with the reconstruction politics The Democrats, taking advantage of the situation, nominated Grover Cleveland of New York. He had won approval by his reform administration as mayor of Buffalo and as governor of New York during the past two years, when he had shown an independence of party "bosses" and had convinced the public of his sincerity and strength of character. He represented conceptions and interests which had grown up since the war, and which appealed to a new generation of voters. The platform emphasized the idea that "new issues are born of time and progress," and made the leading question that of reform and change in Administration, lest the continued rule of one party should corrupt the government. On the question of tariff the Democrats took a conservative attitude, emphasizing their desire to promote healthy growth, rather than to injure any domestic industries, and recognizing that capital had been invested and manufactures developed in reliance upon the protective system. Subject to these limitations, they demanded correction of abuses The Greenbackers nominated Gen. Benjamin F Butler of Massachusetts, recently chosen governor of that State on the Democratic ticket, but he polled only 175,000 votes John P St. John, the candidate of those who would prohibit the liquor traffic, secured 150,000 votes, an unprecedented gain

Cleveland President.—The campaign abounded in bitter personalities, and the popular vote was close, Cleveland's plurality being only 23,000. The great State of New York, with electoral votes enough to have turned the scale, was carried by the Democrats by only a few more than 1,000 votes out of a total of over 1,000,000 Cleveland's electoral majority was 37. The election was nevertheless recognized as making an epoch. For the first time since victory came to Lincoln and the Republicans on the eve of the Civil War, nearly a quarter of a century earlier, the country had entrusted power to the Democrats, although over two-thirds of their electoral vote came from the former slave States New York, Connecticut, New Jersey and Indiana constituted their Northern territory Perhaps the most significant thing about the result was the evidence that in the North political and sectional habits and prejudices were giving way among a sufficient number of independent voters, responsive to strong personal leadership on reform issues, to turn the political scale. The transition from war issues which began in 1872, and became marked in 1876, was completed by the election of Cleveland in 1884

During the first half of his term President Cleveland had the opposition of a strongly Republican Senate. In the second half the Senate remained Republican by a majority of two, and the House continued Democratic His civil service policy naturally met severe criticism not only from his party foes, but also from the independent supporters who looked to him to establish the service on a strictly non-partisan basis. The outcome of the first two years of his Administration was that, of the entire body of Federal office-holders, two-thirds were changed and the obnoxious Tenure of Office Act was repealed, thus leaving the President the right of removal without presenting his reasons. Nevertheless there was a gain, for the criticism by the Republicans placed them on record against the former spoils system; Cleveland somewhat checked the political activity of officeholders; and before leaving the Presidency he transferred the railway mail service to the classified list requiring competitive examination.

The transition of executive power for the time to the Democratic Party, however much it impressed the imaginations of the public, as the end of an era, was not so significant as the national growth and expansion in the decade between 1880 and 1890 whereby forces were set loose which determined the characteristics of the succeeding period. Between these years the nation grew from about 50,000,000 to over 62,000,000. The Middle West, or North Central group of States, gained nearly 5,000,000 and the Western division over 1,250,000 West of the Alleghenies altogether more than 8,000,000 souls had been added, while the old Eastern States gained but 4,000,000. In 1890 the North Central division alone had achieved a population nearly 5,000,000 greater than that of the North Atlantic, while the trans-Allegheny region surpassed the whole East by about 10,000,000, and the numbers of its representatives in House and Senate placed the political destiny of the nation in its hands.



The West.—One of the most important reasons for the wholesale taking up of Western resources in these and the following years was the burst of railway building subsequent to the interruption of the panic of 1873. The eager pioneers pushed into western Kansas and Nebraska as they had into the northern Ohio valley a half-century before. Nebraska grew from a population of 123,000 in 1870 to nearly 500,000 in 1880 and to over 1,000,000 in 1890 From about 333,300 in 1870, Kansas rose to almost 1,000,000 in 1880, and to nearly 1,500,000 in 1890. The railway had "boomed" the Golden West and a cycle of abundant rains seemed to justify the belief that the "Great American Desert" was a myth Thus settlers borrowed money to secure farms beyond the region of safe annual rainfall under the agricultural methods of traditional pioneering Swift disappointment overtook them after 1886, when droughts and grasshoppers ruined the crops and turned back the tide of Middle Western colonists until the western parts of these States were almost depopulated, Kansas alone losing one-seventh of its population; nor did prosperity return for a decade.

As the column of settlement along the Ohio valley had extended its flanks into the old North-west between the Ohio and the Great Lakes, and into the old South-west of the lower Mississippi after the war of 1812, so the later pioneers by railway trains began to take possession of the remoter and vaster North-west and South-west The "granger roads," centring in Chicago, thrust their lines out to develop wheat farms in interior Iowa, Minnesota and the Dakotas, where the virgin soil of the prairie farms brought returns that transferred the wheat belt to this new land of promise, and by competition forced the older wheat areas to develop varied agriculture. The introduction into the Minneapolis mills of the recently invented steel-roller system of making flour not only built up a great flour industry there but created a demand for the hard wheat suited to the North-western prairies. The pine forests of Michigan, Wisconsin and Minnesota were exploited in the same era

A more impressive movement was in progress as additional trans-continental railways were extended from the frontier to the Pacific. In 1870 for 1,000m. west of Duluth, at the head of Lake Superior, along the line of the projected Northern Pacific railway there were no cities or little towns. Relying upon its land grant and upon the undeveloped resources of the vast tributary region, the railway, after halting for a few years subsequent to the panic of 1873 at Bismarck on the Missouri rushed its construction to Seattle and was opened in 1883 The Great Northern, a product of the vision and sound judgment of James J Hill, started from St Paul without a land grant and reached Puget sound in 1893 Thus a new industrial zone had been brought into existence Colorado had become a State in 1876; in 1889 North Dakota, South Dakota, Washington and Montana were admitted as States and the next year Idaho and Wyoming were added The Western political forces, especially the friends of silver, were thus given the balance of power in the Senate.

As a new North-west was opened by the completion of the Canadian Pacific (1883), the Northern Pacific (1883) and the Great Northern (1893), so the new South-west was entered by the completion of the Southern Pacific from New Orleans across Texas, New Mexico, Arizona and southern California to San Francisco by 1883. In 1883 also the lines which became the Atchison, Topeka and Santa Fe, extending from the lower Missouri valley, with St. Louis and Kansas City as important terminals, through south-eastern Colorado, northern Arizona and New Mexico, reached the same goal. The Denver and Rio Grande opened new mining areas between Denver and Ogden.

Not only additional mines were reached by these lines, but a great cattle country, recently the habitat of the bison and the Indian, was opened All the large cities commanding the approaches to this country developed packing industries, but Chicago especially profited South-eastern Texas was the original home of these cattle ranches, but the driving of herds to supply the miners of the Rocky Mountains revealed the fact that the whole bison country was capable of supporting range cattle, and the practice grew of driving the stock to the feeding ground of the north and returning. The height of the movement along the cattle trail, which in its largest extent ran through the public lands of the great plains from Texas to the Dakotas and Montana, was reached in 1884. In that period cattlemen fought over the possession of the range, controlled vast tracts by seizing the approaches to the water supplies under perversion of the land laws, fenced in the public domain, either defiantly or by leases from land grant roads, and called out proclamations of Presidents from Hayes to Cleveland. The steady advance of the farmer, and protective measures against the spread of the cattle disease known as Texas fever, gradually prevented the continuance of the trail, and ultimately broke down the system of great ranches. About 1870 shipment of live-stock from Chicago had become significant, and within a decade the refrigerator car revolutionized the packing industry by making possible the shipment of dressed beef not only to the markets of the Eastern United States but even to Europe. The value of slaughtering and packing industries in the United States increased from less than $30,000,000 in 1870, to $564,000,000 in 1890.

BY COURTESY OF AMERICAN EXPRESS

"ON THE NORTH LINE." THE LAND RUSH TO OKLAHOMA IN 1889
Since 1834 the land comprising the present state of Oklahoma had been in the possession of Indian tribes. In 1889 the Federal government purchased a title to a large tract and a proclamation was issued that at noon on April 22nd, this land would be opened to homestead settlement. More than 20,000 people were on the border at the appointed hour

Another important revolution in American economic life was effected by the opening of new iron mines, the growth of the steel and coal industry and the rise of an extraordinary internal commerce along the whole length of the Great Lakes. By 1890 the output of pig-iron in the United States surpassed that of Great Britain, having doubled since 1880. The full meaning of the revolution is seen in the fact that by 1907 the United States produced more pig-iron and steel than Great Britain, Germany and France combined. As a result of the growth of the wheat, lumber and iron-ore production of the North-west, the traffic along the 1,000m of the Great Lakes grew (chiefly after 1890) by leaps, and changed from wooden sailing-vessels to steel ships driven by steam. The traffic through the Sault Ste. Marie canal came greatly to exceed that through the Suez canal.

The New South.—The South shared in these industrial transformations Not only did white labour produce an increasing proportion of the cotton crop, but cheap white labour came from the uplands to cotton mills situated at the water-powers. This, with the abundant supply of power material, enabled the South to develop cotton manufacture between 1880 and 1890 on a scale that threatened New England's dominance The southern Appalachians began to yield their treasures of coal and iron; northern Alabama became one of the great centres of the iron industry and the South produced nearly 400,000 tons of pig-iron in 1880 and 2,500,000 20 years later By 1890 the production of coal, iron-ore and pig-iron in this section was as great as that of the United States in 1870. The value of the products of manufacture in the South rose from $338,000,000 in 1880 to $1,184,000,000 in 1900. The exploitation of the long leaf pine forests also attracted Northern capital Fruit and truck gardening grew rapidly, and the South began to exhibit traits of industrial development familiar in the North and West. The negro problem continued to hold the South as a whole to the Democratic party.

Industrial Changes.—The opportunities opened to capital by these forces of growth in the West and South, as well as the

general influence of an age of machine production, led to transformations in the East which brought new difficulties for political solution. The East began to exhibit characteristics of other long-settled countries where increasing density of population and highly developed industry are accompanied by labour troubles To capital the opening resources of the West, and the general national prosperity after 1879, offered such inducements that large scale production by corporations became the order of the day. The forces which had exhibited themselves in increased manufacture and railway development between the Civil War and the panic of 1873 now found expression in a general concentration of industries into fewer plants with vastly greater capital and output, in the combination of partnerships into corporations, and of corporations into agreements and trusts to avoid competition and to secure the needed capital and economies for dealing with the new problems of industrial magnitude. Western farming competition led to the actual abandonment of much inferior land in New England and to agricultural disadvantages in the Middle States. As agriculture became less attractive and as industrial demands grew, the urban population of the East increased at the expense of the rural. The numbers of cities of the United States with more than 8,000 people nearly doubled between 1880 and 1890; by 1900, the urban population constituted a third of the total; this phenomenon was especially marked in the North Atlantic division, where, by 1900, over half the population was in cities of more than 8,000 inhabitants

In similar fashion concentration of industry in large establishments was in progress In 1880 nearly 2,000 mills were engaged in the woollen industry; in 1890 not many more than 1,300 Even more marked was the change in iron and steel, where large-scale production and concentration of mills began to revolutionize this fundamental industry, and other lines of production showed the same tendency. The anthracite mines of Pennsylvania fell into the possession of seven coal-carrying railways which became closely allied in interest. In most of the important industries the tendency of large organizations to subject or drive out the small undertakings became significant. Already the railways to avoid "cut-throat competition" had begun to consolidate, to form rate agreements and to "pool" their earnings.

Interstate Commerce Act.—The Cullom bill as enacted into the interstate commerce law of Feb. 4, 1887, was framed to prevent unjust discriminations by the railroads between persons, places and commodities, the tendency of which was to foster monopoly. The law forbade discriminations and pooling, made a higher charge for a short haul than for a long haul over the same road illegal, required publicity of rates, and provided for a commission to investigate and fine offenders. But the decisions of the commission were reviewable by the Federal courts and the offender could be coerced, if he refused to obey the commission, only by judicial proceedings. The commission was empowered to provide uniform accounting and to exact annual reports. The principle settled by the law was an important one, and marked the growing reliance of the former individualistic nation upon Federal regulation. But the difficulties by no means disappeared; the Federal judiciary refusing to accept the findings of the commission on questions of fact, retried the cases; and the Supreme Court overruled the commission on fundamental questions, and narrowed the scope of the act by interpretation.

Social Unrest.—Labour exhibited the tendency to combination shown by capital. The Knights of Labor, founded in 1869, on the basis of "the individual masses" instead of the trades unions, and professing the principle that "the injury of one is the concern of all," grew from a membership of about 100,000 in 1885 to 730,000 in 1886. The number of strikes in 1886 was over twice as many as in any previous year. In one of the strikes on the Gould railway system 6,000m. of railway were held up. In New York, Henry George, author of books proposing the single tax on land, ran for mayor of the city and received 68,000 out of 219,000 votes. At the same time socialistic doctrines spread, even among Western farmers But sympathetic strikes, anarchistic outbreaks, and drastic plans for social change did not appeal to the people as a whole. The Knights of Labor began to split. and the unions, organized as the American Federation of Labor, began to take their place with a less radical membership President Cleveland broke with precedents in 1886 by sending in the first message on labour, in which he advocated, without success, a labour commission to settle controversies A national bureau of labour to collect statistics had been established in 1884; State legislation increasingly provided for arbitration of labour disputes, and regulation of factories and child labour

Early in 1885 a law had been enacted forbidding the importation of labour under contract, and in 1888 the Chinese Exclusion Act was continued. Immigration was exceptionally large in the decade from 1880 to 1890, amounting to about 5,250,000 as compared with 2,800,000 for the previous decade But a large number of these new-comers settled on the newly opened lands of the Middle West By 1890 the persons of German parentage in the Middle West numbered over 4,000,000. Minnesota held 373,000 persons of Scandinavian parentage. The Irish constituted the largest element among the English-speaking immigrants The population of foreign parentage amounted to one-third of the whole population of the United States in 1890.

In the midst of this national development and turmoil President Cleveland struggled to unite his party on a definite issue. The silver question continued to divide each party, the continued fall of silver leading to renewed agitation for free coinage. The surplus led to extravagant appropriation bills, such as special pension bills, which Cleveland vetoed altogether, thereby incurring criticism by veterans of the Civil War, and river and harbour improvement measures, particularly the act of 1886, to which the President gave reluctant assent, and the bill of 1887, to which he gave a "pocket veto" by refusing his signature. But the retention of the surplus in the Treasury would create a monetary stringency, its deposit in banks aroused opposition, and its use to buy bonds was unpopular with the Democrats.

The Tariff.—Cleveland boldly met the issue and gave purpose to his party by his annual message of Dec. 1887, which he entirely devoted to an exposition of the situation arising from the surplus, and to a demand for a revision of the tariff in order to reduce revenue. He did not profess free trade doctrines: "It is a condition which confronts us, not a theory," he declared. The election of 1886 had reduced the Democratic majority in the House, but the President was able to induce his party to pass the Mills bill (1888) through that body as a concrete presentation of policy The bill put many important raw materials (including wool) on the free list, substituted *ad valorem* for specific duties to a large extent, and generally reduced the protective duties. It was believed that the measure would remit over $50,500,000 of duties, nearly $20,000,000 of which would result from additions to the free list. The Republican Senate also found party unity on the tariff issue and its committee on finance, under the leadership of Senator Nelson W. Aldrich of Rhode Island, drafted a counter proposal. They would reduce revenue by repealing the taxes on tobacco, and the taxes on spirits used in the arts and for mechanical purposes, and by revising the tariff so as to check imports of articles produced at home.

Harrison Elected.—On the tariff issue the two parties contested the election of 1888, the Republicans denouncing the Mills bill and the Democrats supporting it. Blaine having withdrawn from the contest, and John Sherman having secured but little more than half the votes necessary to nominate, the Republicans picked from a multitude of candidates Gen. Benjamin Harrison of Indiana, grandson of President William Henry Harrison, to run against Mr. Cleveland. The popular vote was exceedingly close, but Harrison had an electoral majority of 65, having carried all of the States except the solid South, Connecticut and New Jersey The increasing use of money to influence the election, and particularly the association of great business interests with such political "bosses" as Matthew S. Quay of Pennsylvania and Thomas C. Platt of New York, were features of the campaign The congressional elections ensured to the Republicans the undisputed control of all branches of the Government when the 51st Congress should convene, and it was generally agreed that the party had a mandate to sustain the protective tariff.

THE GREAT SEALS OF THE UNITED STATES AND OF THE INDIVIDUAL STATES

The design for the Great Seal of the United States of America was adopted June 20, 1782. The reverse side was originally designed, but was never cut

Lacking a large majority in either house the Republicans were exposed not only to the danger of free silver defections in the Senate, but also to "filibustering" by the Democratic minority in the House as the means of blocking the victorious party's programme. These obstructive tactics were made possible chiefly by the use of privileged motions and roll calls to delay business, and the refusal to respond on the roll call for a vote, thus preventing a quorum. Speaker Thomas B. Reed of Maine, a virile and keen-witted leader, greatly strengthened the power of the Speaker, as well as expediting the business of the House, by ruling that the Constitution required a present, not a voting, quorum; and in spite of disorderly protests he "counted a quorum" of those actually present. By securing rules sanctioning this action and empowering the Speaker to refuse to entertain dilatory motions, that officer became the effective agent for carrying on the business of the party majority. As his power through the committee on rules, which he appointed, grew, he came, in the course of time, also to dominate the action of the House, refusing to recognize members except for motions which he approved. This efficiency of action was secured at a loss to the House as a representative and debating body, responsive to minority proposals.

Sherman Anti-Trust Act.—But the discipline of party caucus and House rules enabled the Republican leaders to put through with rapidity a number of important laws. One of these was the measure known as the Sherman Anti-Trust Act of July 2, 1890, which declared combinations affecting commerce between the several States, or with foreign nations, illegal and punishable by fine or imprisonment or both. This act, the full power of which was not exhibited until later, was a response to the growing unrest of the nation as other corporations emulated the success of the Standard Oil Trust (formed in 1882). The members of a trust combined in an organization managed by boards of trustees whose certificates the former owners accepted instead of their shares of stock in the component companies. Competition was thus eliminated within the combination and the greatly increased capital and economies enabled it not only to deal with the increasing magnitude of business operation, but also to master the smaller concerns which opposed it. State legislation had proved unable to check the process, partly because the trust was an interstate affair By putting into operation its power to regulate interstate commerce, Congress responded to the popular demand for Federal restraint of these great combinations which threatened the old American ideals of individualism and freedom of competition. The trusts, although embarrassed, soon showed their ability to find other devices to maintain their unified control. Nor was the act used, in this period, to prevent the railways from agreements and combinations which in large measure neutralized the anti-pooling clause of the Interstate Commerce Act of 1887

Silver Purchases.—Another important law was the so-called Sherman Silver Purchase Act of July 14, 1890. By 1889 the ratio of silver to gold had fallen to one to 22. In the 12 years of the Bland-Allison Act of 1878 over 378,000,000 silver dollars had been coined from bullion purchased at the market price This bullion value was falling: it was $.89 in 1877 and $.72 in 1889. The production of gold in the United States in 1878 was about 2,500,000 fine ounces, and of silver about 35,000,000; in 1890 the gold production was 1,588,000 and the silver 54,500,000. The Silver Purchase Act authorized the secretary of the Treasury to purchase each month 4,500,000 oz. of silver at its market price and to pay for it in treasury notes redeemable at his discretion, in silver or gold.

McKinley Tariff.—The customs duties upon which the fighting of the campaign of 1888 had turned was promptly taken up, and in the McKinley Tariff Act of Oct. 1, 1890 the Republicans embodied their conceptions of protection to American industry. Some of the main features of this law were: the addition of agricultural products to the protected articles; the extension of the free list, particularly the inclusion therein of raw sugar, which had been bringing in a revenue of $50,000,000 annually; the granting of compensating bounties to sugar planters to an amount of about $10,000,000 a year; and the raising of duties to the prohibitory point on many articles of general consumption which could be produced at home Blaine, then secretary of State, had just been active in promoting closer relations with South America wherein he hoped for an extension of American trade and he severely criticized the bill as it passed the House, because the free list opened wide the doors of American trade, particularly to sugar-producing countries, without first exacting compensating advantages for our products in those markets. To meet this criticism a provision was finally added authorizing the President to impose discriminating duties where it was necessary to obtain the advantages of reciprocity.

This tariff, which passed on the eve of the congressional elections of 1890, was immediately followed by such increases in prices and the cost of living that it was potent in bringing about the political revolution, or "land slide," which swept the Republicans from power in the House of Representatives. The Republicans returned but 88 members as compared with nearly twice that number in the Congress which passed the McKinley bill. Looked at broadly, the movement was a rural uprising, strongest in the South and Middle West, the old Granger areas, against forces which seemed to them to threaten their ideals of American democracy. But the movement was recruited by the silver-mining states and discontented labour interests.

Farm products had not proportionately shared the general increase in prosperity. This convinced large portions of the agricultural West that the currency system had too narrow a basis in gold, which was appreciating in value. Much of the Middle Western agricultural development had been made on borrowed Eastern capital, and it seemed to the farmer that the principal of his mortgage was in effect increasing with the rise in the price of gold, at the same time that his crops brought a smaller net profit. He did not give due attention to the effect of greatly increased production, as the new wheat lands were opened on such a grand scale; but he was keenly sensitive to increased freight rates and to the influence of Eastern capitalists, banks, bondholders, trusts and railways upon Federal and State legislatures and judiciary. After the evidence of the power of this tide of Western discontent in the elections of 1890, those portions of it which were ripest for revolt combined in 1892 as the People's Party or Populists, soon to prove an important political factor.

The Republicans meanwhile had been actively reducing the surplus. In 1892 the excess of revenue over expenditures was $10,000,000; in 1893 only $2,000,000. This was effected not only by the Tariff Act but by such measures as the Dependent Pension Act of 1890 (resulting in a list of pensioners of the Civil War which cost the nation $68,000,000 by 1893, over half of these pensioners having been added during Harrison's Administration); the rapid construction of the new Navy, raising the United States from 12th to fifth in the list of naval powers; the repayment of the direct war tax to the States (1891) to the amount of $51,000,000; and other appropriations such as those provided by river and harbour bills. The Democrats stigmatized this Congress as a "billion dollar Congress" from its expenditures, to which Speaker Reed replied that the United States was a billion dollar nation. In fact the Democrats when they regained power were not able greatly to diminish the cost of government

Homestead Strike.—The Democratic House in the 52nd Congress repressed obstructive Republican tactics by methods like those adopted by Speaker Reed, and contented itself with passing a series of bills through that body proposing reductions of the tariff in special schedules, including free wool and a reduction of the duty on woollens, free raw material for the cotton planters of the South, free binding twine for the farmers of the North and a reduced duty on tin plate for the fruit raisers. Of course these bills failed in the Republican Senate. A bloody strike on the eve of the election of 1892 in the great steel works at Homestead, Pa., where armed guards engaged by the company fired upon the mob which sought higher wages, was not without its adverse effect upon public sentiment in regard to the Republican tariff for the protection of labour.

During the campaign of 1892 the Democrats rejected a conservative tariff plank, denounced the McKinley tariff in violent language, and denied the constitutional power to impose tariff

duties except for the purpose of revenue only. But Cleveland, who was renominated in spite of vigorous opposition from leading politicians of his own State, toned down the platform utterances on the tariff in his letter of acceptance In their declarations upon the currency the Democrats furnished a common standing ground for the different factions by attacking the Silver Purchase Act of 1890 as a cowardly makeshift.

Cleveland Re-elected.—The People's Party, in its national convention at Omaha (July 1892), drew a gloomy picture of Government corrupted in all of its branches, business prostrated, farms covered with mortgages, labour oppressed, lands concentrating in the hands of capitalists. Demanding the restoration of government to the "plain people," they proposed an expansion of its powers, to afford an adequate volume of currency and to check the tendency to "breed tramps and millionaires" Among their positive proposals were the free and unlimited coinage of silver at the legal ratio of 16 to one, the expansion of a national currency issued directly to the people, the establishment of postal savings banks; Government ownership of the railways, telegraph and telephone; restoration to the Government of the lands held by railways and other corporations in excess of their needs; and a graduated income tax Combining with the Democratic Party in various States beyond the Mississippi, and with Republicans in some of the Southern States, they won large masses of voters in the West, and exerted an influence upon public opinion in that section beyond what was indicated in the returns, although Gen James B. Weaver of Iowa, their candidate for the Presidency, received over 1,000,000 popular votes and 22 votes in the electoral college The Republicans renominated President Harrison, though he lacked an enthusiastic personal following. They supported the McKinley Tariff Act in spite of the wave of opposition shown in the elections of 1890. But, fearing party divisions, they, like the Democrats, made an ambiguous declaration on the currency. The result of the election of 1892 was to return the Democrats under Cleveland to power by a plurality of over 380,000 and an electoral plurality of 132. Congress in both branches was to be Democratic in 1893, and the way was open for the first time in a generation for that party to carry out a policy unchecked by any legislative or executive branch of Government.

Panic of 1893.—But before Cleveland was fairly started in his second Administration the disastrous panic of 1893 swept the nation, nor did prosperity return during the four years that followed. The panic is not, directly at least, to be traced to the silver purchases, but was the result of various causes, including the agricultural depression, farm mortgages, reckless railway financing and unsound banking in the United States. The panic began in the spring with the failure of the Reading railway and the collapse of the National Cordage Company, one of the numerous examples of reckless trust financiering into which large banks had also been drawn. Clearing-house certificates were resorted to by the New York banks in June, followed in August by partial suspension of specie payments. Currency remained at a premium for 8 month; deposits in national banks shrank enormously; national bank loans contracted more than 14·7%; failures were common; 22,000m. of railways were under receiverships, and construction almost ceased.

The panic of 1893 was in many ways a turning-point in American history. It focused attention upon monetary questions, prostrated the silver-mining States, embittered the already discontented farming regions of the West, produced an industrial chaos out of which the stronger economic interests emerged with increased power by the absorption of embarrassed companies, and was accompanied by renewed labour troubles. Most noteworthy of these was the Pullman Car Company strike near Chicago in 1894, which led to sympathetic strikes by the American Railway Union, extending over 27 States and Territories from Cincinnati to San Francisco. Mobs of the worst classes of Chicago burned and looted cars. The refusal of Gov. John P. Altgeld of Illinois to call out the militia, and interference with the United States mails, led President Cleveland to order Federal troops to the scene, on the constitutional ground that they were necessary to prevent interference with interstate commerce and the postal service and to enforce the processes of the Federal courts. The courts issued a sweeping injunction requiring that the members of the American Railway Union or other persons desist from interference with the business of the railways concerned. The president of the striking organization, Eugene V. Debs, was imprisoned for contempt of court and conspiracy.

Silver Issue.—The most immediate political effect of the panic was upon the silver issue Soon after the outbreak of the financial crisis, the gold reserve, which protected the greenbacks and the Treasury notes issued under the Silver Purchase Act, shrank ominously, while foreigners returned their American securities instead of sending gold. To sell bonds in order to replenish the gold reserve, and to repeal the Silver Purchase Act without substituting free coinage, would aggravate Western discontent and turn away the promise of recruits to the Democratic Party from the Populists of the prairie and silver-mining States; to carry out the Democratic platform by a tariff for revenue only while mills were shutting down would be hazardous in the East The fruits of victory were turning to ashes; but Cleveland summoned a special session of Congress for August, while the panic was acute, and asked his party to repeal the Silver Purchase Act without accompanying the repeal with provisions for silver Not until the last of Oct. 1893 was repeal carried, by a vote in which the friends of repeal in the House were about equally divided between Democrats and Republicans, and nearly two-thirds of its opponents Democrats.

By this time the surplus had disappeared and the gold reserve was drawn upon for ordinary expenses. Early in 1894 the Administration, failing to secure legislation from Congress to authorize the sale of gold bonds on favourable terms to protect the reserve, sold under the Resumption Act of 1875 $50,000,000 5% bonds, redeemable in ten years Part of this very gold, however, was withdrawn from the reserve by the presentation of legal tender notes for redemption, and the "endless chain" continued this operation to the verge of extinguishing the reserve, so that another loan of $50,000,000 in 1894 was followed in 1895 by a dramatic meeting between Cleveland and some of his cabinet with the Wall street banker, J. Pierpont Morgan, who agreed on behalf of his syndicate to sell the Government $65,166,000 of gold for $69,315,000 of bonds, equivalent to 4% bonds for 30 years at a price of 104. In return the syndicate agreed to use its influence to protect the withdrawals of gold from the Treasury. These securities were over-subscribed when offered to the public at 112½. President Cleveland had protected the Treasury and sustained the parity of gold and silver, but at the cost of disrupting his party Again, in the beginning of 1896, the Treasury was forced to sell bonds, but this time it dealt directly with the public and easily placed $100,000,000 in bonds at about 111, affording a rate of interest about equal to 3·45%.

Tariff Reform.—Before the political harvest of the monetary issue was reaped, the Democrats had also found party ties too weak to bear the strain of an effective redemption of the party pledges on the tariff. The Wilson bill prepared as the administrative measure was reported late in 1893, while the panic was still exerting a baneful influence. Its leading features were the substitution of *ad valorem* for specific duties in general, the extension of the free list to include such materials of manufacture as iron ore, wool, coal, sugar and lumber, and the reduction of many prohibitory rates The loss in revenue was partly provided for by an income tax, significant of the new forces affecting American society, and an increase in the duty on distilled liquors. Although the bill passed the House by an overwhelming majority, it met the opposition in the Senate of the representatives, Democratic as well as Republican, of those States whose interests were adversely affected. Led by Senators Arthur P. Gorman, of Maryland; Calvin S. Brice, of Ohio; and David B. Hill, of New York, the bill was transformed by an alliance between Democratic and Republican senators, on the plea that it would otherwise result in a deficit of $100,000,000 Coal, iron ore and sugar were withdrawn from the free raw materials and specific duties replaced *ad valorem* in many cases, while many other individual schedules

were amended in the direction of protection. The House, given the alternative of allowing the McKinley Act to remain or to accept the Senate's bill, yielded, and the Wilson-Gorman Tariff Act became a law without the President's signature, Aug 27, 1894 Even the income tax was soon (1895) held by the Supreme Court to be unconstitutional.

Venezuela Message.—Toward the close of his administration Cleveland's brusqué message on the Venezuelan boundary question aroused such excitement and so rallied the general public (though not the more conservative) that the war spirit, shown soon afterwards against Spain, might have been a potent factor in the election of 1896 had not England exhibited exceptional moderation and self-restraint in her attitude The silver question, therefore, became the important issue The Republicans nominated McKinley and declared for the gold standard in opposition to free coinage, losing thereby an influential following in the silver-mining and prairie states, but gaining the support of multitudes of business men among the Democrats in the East and Middle West

William J. Bryan.—The Democratic convention marked a revolution in the party. The old school leaders were deposed by decisive majorities, and a radical platform was constructed which made "the free and unlimited coinage of both silver and gold at the present legal ratio of 16 to one, without waiting for the aid or consent of any other nation," the paramount issue. Objecting also to the decision against the income tax, and to "government by injunction as a new and highly dangerous form of oppression," they incurred the charge of hostility to the Federal judiciary. William J. Bryan made a brilliant speech in behalf of free coinage, and so voiced the passion and thought of the captivated convention that he was nominated by it for the Presidency over the veteran free-silver leader, Richard P. Bland of Missouri. The Cleveland men, or "gold Democrats," broke with their party after it became committed to free silver, and holding a convention of their own, nominated Gen John McA Palmer, of Illinois, for the Presidency on a platform which extolled Cleveland, attacked free coinage and favoured the gold standard. Its main influence was to permit many Cleveland men to vote against Bryan without renouncing the name of Democrats. On the other hand the Populist convention also nominated Bryan on a platform more radical than that of the Democrats.

The contest was marked by great excitement as Bryan travelled across the country addressing great audiences. The endangered business interests found an efficient manager in Marcus A Hanna of Ohio, McKinley's adviser, and expended large sums in a campaign of education. In the event, the older States of the Middle West, holding the balance between the manufacturing and capitalistic East and the prairie and mining States of the West, gave their decision against free silver. But class appeals and class voting were a marked feature of the campaign, the regions of agricultural depression and farm mortgages favouring Bryan, and those of urban life favouring McKinley. Labour was not convinced that its interests lay in expanding the currency, and Mr. Hanna had conducted McKinley's campaign successfully on the plea that he was the advance agent of prosperity under the gold standard and a restoration of confidence. McKinley carried all the Northern States east of the Missouri, and North Dakota, Oregon and California of the Farther West, as well as Maryland, Delaware, West Virginia and Kentucky. His plurality over Bryan in the popular vote was more than 600,000, and his electoral majority 95 All the departments of Government were transferred by the election to the Republicans.

Dingley Tariff.—Having secured power, the Administration called a special session of Congress, and enacted the Dingley protective tariff (July 24, 1897), under which the deficit in the Treasury was turned into a surplus. The act raised duties to their highest point, and as the protective schedules included some important articles produced by trusts which had a practical monopoly, such as sugar and petroleum, this was seized upon by the Democrats to stigmatize the tariff as the "mother of trusts." Many articles which had been placed on the free list in the Tariff Act of 1894, including lumber and wool were made dutiable.

Gold Standard.—The Republicans also wrote their triumph into the Gold Standard Act of March 4, 1900, which ensured the maintenance of this standard by reserving $150,000,000 of gold coin and bullion to redeem the United States notes and the Treasury notes of 1890, and by authorizing the sale of bonds when necessary to maintain the reserve National banks were authorized in the smaller towns (3,000 or less) with a capital of $25,000, half of that formerly required, and increased circulation was further provided for by permitting the national banks to issue notes on United States bonds up to their par value.

Economic Changes.—The economic policy of the Republicans was facilitated by the prosperity which set in about 1898. The downfall of silver-mining turned the prospectors to seek new goldfields, and they found them, especially in Alaska; and contemporaneously the chemists discovered cheaper and more efficient methods of extracting the gold from low-grade ores Within five years after the crisis of 1893 the gold production of the United States nearly doubled. The United States coined $437,500,000 in gold in the five-year period 1897–1902, while the average for five-year periods since 1873 had been only $224,000,000. Thus gold instead of silver began to inundate the market, and to diminish the demand for expansion of the currency. Agriculture, prostrated in the years immediately preceding and following the panic of 1893, turned to the scientific study of its problems, developed dry farming, rotation and variety of crops, introduced forage crops like alfalfa, fed its Indian corn to cattle and hogs, and thus converted it into a profitable and condensed form for shipment. Range cattle were brought to the corn belt and fattened, while packing industries moved closer to these western centres of supply. Dairy-farming replaced the unprofitable attempts of older sections of the Middle West and the East to competé with the wheat-fields of the Farther West. Truck and fruit farming increased in the South, and the canning industry added utility to the fruits and vegetables of the West. Following the trend of combination the farmers formed growers' associations and studied the demand of the market to guide their sales. The mortgaged farms were gradually freed from debt. The wheat crop increased from less than 400,000,000bu. valued at $213,000,000 in 1893 to 675,000,000bu. valued at $392,000,000 in 1898. Prosperity and contentement replaced agitation in the West, and the Republican Party gained the advantage of these changed conditions.

In the South also there was greater contentment as the new industries of iron, textiles and forestry grew, and as the cotton crops increased. Unrest was diminished by the new State Constitutions, which after 1890 disqualified negro voters by educational and tax requirements so contrived as not to disfranchise the poor whites.

In the decade which followed the crisis of 1893 a new industrial structure was made out of the chaos of the panic. "High financing" was undertaken on a scale hitherto unknown. Combinations absorbed their weaker rivals; Standard Oil especially gained large interests in New York banks and in the iron mines and transportation lines about the Great Lakes, while it extended its power over new fields of oil in the South-west. In general, a small group of powerful financial interests acquired holdings in other lines of business, and by absorptions and "community of interest" exerted great influence upon the whole business world. The group of financiers, headed by J. Pierpont Morgan, came to dominate various Southern transportation lines and the anthracite coal roads and mines, and extended their influence to the Northern Pacific railway, while a new genius in railway financing, Edward H Harriman, began an avowed plan of controlling the entire railway system of the nation. Backed by an important banking syndicate he rescued the Union Pacific from bankruptcy, and with its profits as a working basis he started in to acquire connecting and competing lines. Labour also shared in the general prosperity after 1898 Relative real wages increased, even allowing for the higher cost of living, and the length of the working day in general decreased except in special industries.

General Prosperity.—By 1900 the continental United States had a population of 76,000,000; an aggregate real and personal wealth of $88,500,000,000; a per capita public debt of $14.52, and per capita money circulation of $26.94 against $21.41 in 1896. In 1901 bank clearings amounted to nearly $115,000,000,000 against

$45,000,000,000 in 1894 Imports of merchandise had fallen in this period, while exports rose from about $847,000,000 in 1893 to $1,394,000,000 in 1900 Of these exports foodstuffs and food animals, crude and partly manufactured, aggregated nearly 40% of the total. The production of pig iron, which was about 7,000,000 long tons in 1893, was nearly twice that in 1900 This economic prosperity and these far-reaching processes of social change by which the remaining natural resources of the nation were rapidly appropriated, went on contemporaneously with the extension of the activity of the nation overseas. The first rough conquest of the wilderness accomplished, the long period of internal colonization drawing to a close, the United States turned to consider its position as a world power.

To understand this position it is necessary to return to an earlier period and briefly survey the foreign relations since the close of the reconstruction era The most significant and persistent influence came from the growing interest of the United States in the Pacific, as its population and economic power extended to that ocean. The problem of an overflow of Chinese migration to the Pacific coast, and the jeopardizing of the American standard of labour by this flood, had been settled by various treaties and laws since 1880. The question of the relation of the United States to an interoceanic canal was not so easily settled In 1878 Colombia granted a concession to a French company, promoted by Ferdinand de Lesseps, the engineer of the Suez canal, to dig a tide-level canal through the Isthmus of Panama. President Hayes voiced the antagonism of the United States to this project of European capital in his message of 1880 in which he declared that such a canal should be under the control of this nation, and that it would be "virtually a part of the coast-line of the United States." Although an American company was organized to construct a canal under a concession from Nicaragua in 1884, no real progress was made, and the French company, defeated by engineering and sanitary difficulties, failed at the close of 1888.

Pan-American Congress.—Meantime, for a few months, Blaine, as secretary of State under President Garfield, began a vigorous foreign policy with especial reference to the Pacific. He attempted to get the consent of England to abrogate the Clayton-Bulwer Treaty of 1850, which contemplated the construction of an isthmian canal by private enterprise under joint control and neutralization of the United States and Great Britain, together with such other Powers as should join them. In South America he actively pressed the influence of the United States to settle the war between Chile and Peru Again, in the years from 1889 to 1892, Blaine held the portfolio of State, and attempted to increase the influence of his country in Spanish America by the Pan-American congress of 1890, which proposed a great international railway system and bank, commercial reciprocity and arbitration, without immediate results Indeed, the bad feeling aroused by his earlier policy toward Chile found expression in 1891 in a mob at Valparaiso, when some of the men from the United States ship "Baltimore" on shore leave were killed and wounded. An apology averted the war which President Harrison threatened Blaine also asserted, against Canada particularly, the right of the United States to the seals of the Bering Sea; but in 1893 arbitrators decided against the claim.

Foreign Affairs.—As the Navy grew and American policy increasingly turned to the Pacific, the need of coaling stations and positions advantageous to its sea power was appreciated. By a tripartite treaty in 1889 the Samoan islands were placed under the joint control of the United States, England and Germany, and, a decade later, they were divided among these powers, Tutuila and the harbour of Pago-Pago falling to the United States. The Hawaiian islands, which had been brought under the influence of civilization by American missionaries, were connected by commercial ties with the United States. Upon the attempt of the ruler to overturn the constitution, the American party, aided by the moral support of the United States, which landed marines, revolted, set up a republic, and asked annexation to the Union. A treaty, negotiated under President Harrison to this end, was withdrawn by President Cleveland, after investigation, on the ground that the part of the United States in the revolution was improper. He attempted, without success, to restore the original state of affairs, and on July 7, 1898, the islands were annexed

President Cleveland's conservatism in this and other matters of foreign policy had not prepared the people for the sudden exhibition of firmness in foreign policy with which he startled the nation in his message of Dec. 1895 upon the question of the boundary of Venezuela That nation and England had a long-standing dispute over the line which separated British Guiana from Venezuela. Great Britain declined to arbitrate, at the suggestion of the United States, and gave an interpretation to the Monroe Doctrine which the Administration declined to accept. President Cleveland thereupon brusquely announced to Congress his belief that Great Britain's *attitude* was in effect an attempt to control Venezuela, and proposed that a commission on the part of the United States should report upon the disputed boundary, and support Venezuela in the possession of what should be ascertained to be her rightful territory. Secretary of State Richard Olney declared: "To-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition." Great Britain tactfully accepted arbitration, however, and in the end (1899) was awarded most of the territory regarding which she had been unwilling to arbitrate.

Spanish-American War.—The growing activity of the United States in foreign relations next manifested itself against Spain. Cuba in its commanding position with reference to the Gulf of Mexico and the approaches to the proposed isthmian canal, as well as in its commercial relations, and its menace as a breeding spot for yellow fever, had long been regarded by the United States as an important factor in her foreign policy. Between 1868 and 1878 a harsh war had been in progress between the island and the mother country, and American intervention was imminent. But Spain promised reforms and peace followed; again in 1895 revolt broke out, accompanied by severe repressive measures, involving grave commercial injury to the United States

By the Treaty of Paris, signed Dec. 10, 1898, Spain lost the remaining fragments of her ancient American empire. She relinquished Cuba, which the United States continued temporarily to occupy without holding the sovereignty pending the orderly establishment of an independent Government for the island. Porto Rico, Guam and the Philippines were ceded outright to the United States, which agreed to pay $20,000,000 to Spain, and to satisfy the claims of its citizens against that power. By the treaty Congress was to determine the civil rights and political status of the native inhabitants of the ceded territory.

As a result of the Spanish-American War, the United States found itself in a position of increased importance and prestige among the nations of the world. Especially in the Pacific, it was immediately involved in the diplomatic situation created by the efforts of European States to divide China into spheres of influence or of actual possession. The interests of the United States in the trade with China, as well as her new position in the Philippines, inclined her to oppose this policy, and secretary of State John Hay showed himself one of the great American diplomats in his treatment of this difficult problem. In order to preserve Chinese entity and the "open door" for trade, he drew replies from the nations concerned, the result of which was to compel them to avow and moderate their intentions.

The acquisition of Porto Rico and the acceptance of responsibilities in Cuba gave new importance to the isthmian canal and increased the relative weight of the United States in regard to its control. The popular excitement with which the voyage of the "Oregon" was followed, as it took its way 14,000m around South America to participate in the destruction of the Spanish fleet in the battle of Santiago, showed the American people the need of such communication between the Atlantic and Pacific coasts.

The Philippines.—But the immediate political issues were concerned with problems of the relation of the newly won lands to the United States Government. Bryan had persuaded his party to join in ratifying the Treaty of Paris, expecting to determine the status of the islands later. But attention soon turned to the insurrection which broke out (Feb. 4, 1899) in the Philippines under Aguinaldo, after it became probable that the Administra-

tion intended to retain these islands, not under a weak protectorate, but as a possession to be ruled and "assimilated." It was not until the spring of 1902 that this insurrection was completely put down, and in the interval the question of the destiny of the islands and the harshness of the measures of repression aroused political debate The Democrats and many Republicans charged the Administration with a policy of imperialism.

Porto Rico.—The same issue was involved, in its constitutional and economic aspects, in the treatment of Porto Rico and Cuba. While the insurrection contmued in the Philippines the government there was legally a military one, although exercised in part through civil officers and commissions. But in the case of Porto Rico the question was whether the "Constitution follows the flag," that is, whether it extended of its own force without an act of Congress to acquired territory, and covered the inhabitants with all the rights of citizens of the United States, as an integral part of the American people.

The Foraker Act of 1900 imposed a special tariff for two years upon Porto Rico, the proceeds to go to that island's own Treasury. The act further asserted the principle that the inhabitants of the new possessions were not incorporated into the United States or entitled to all the privileges of citizens of the United States under the Constitution, by declaring that statutory acts of the United States locally inapplicable should not be in force in Porto Rico. The Supreme Court sustained this act in 1901, holding that Porto Rico was not so strictly a part of the United States that separate customs tariffs could not be imposed upon the territory. The Foraker Act also provided a government for the island. In Cuba the United States remained in authority until May 20, 1902. Details of the arrangements whereby the United States secured the substantial advantages of a protectorate without destroying the independence of Cuba, will be found by the reader in the article on CUBA.

Re-election of McKinley.—Meantime, in the election of 1900, the Democrats renominated Bryan on a platform which opposed the Republican Administration's acts in relation to the newly acquired territory and declared that "imperialism" was the paramount issue The platform reaffirmed its silver doctrine of the previous campaign and denounced the tariff as a breeder of trusts. The Republicans renominated McKinley and endorsed his Administration. McKinley received an electoral majority of 137 and a popular plurality of 849,790. Before his second term was fairly begun he was shot by an anarchist while attending the Pan-American exposition at Buffalo, and died on Sept. 14, 1901. His wisdom in choosing able cabinet officers, his sympathetic tact in dealing with men and with sections, as well as the victories of the Spanish-American War, had brought him popularity even among his political opponents. But McKinley, like Cleveland, lacked the imagination to perceive and the desire to voice the aspirations and demands that had been gathering force for many years for legislation and executive action that should deal with the problem of effective regulation of the economic forces that were transforming American society. This gave his opportunity to Theodore Roosevelt, who as vice president now succeeded to office.

Roosevelt President.—It was in foreign relations, which Secretary Hay continued to conduct, that continuity with McKinley's Administration was most evident. But even here a bolder spirit, a readiness to break new paths and to take short cuts was shown by the new President Venezuela had long delayed the payment of claims of citizens of various nations. In 1901, the President, having been informed by Germany of its intention to collect the claims of its citizens by force, but without acquisition of territory, announced that the United States would not guarantee any State against punishment if it misconducted itself, provided that the punishment did not take the form of acquisition of territory. As a result, a blockade of Venezuela was undertaken by the joint action of Germany, England and Italy at the close of 1902. The diplomatic intervention of the United States early the next year resulted in Venezuela's agreement to pay the claims in part and to set aside a portion of her customs receipts to this end. But since the blockading powers demanded preferential treatment, the United States secured a reference of the question to The Hague court, which decided that this demand was justified. Santo Domingo offered a similar problem, having a debt incurred by revolutionary governments, beyond its power to pay, and being threatened with forcible intervention by European States. President Roosevelt, in 1904, declared that in case of wrongdoing or impotency requiring intervention in the western hemisphere the United States might be forced "to the exercise of an international police power." In 1905 Santo Domingo and the United States signed a protocol under which the United States Government was empowered to take possession of the custom-house, conduct the finances and settle the domestic and foreign debts of Santo Domingo. In spite of the refusal of the Senate to assent to this protocol, President Roosevelt put the arrangement unofficially into effect, until, in 1907, the Senate consented to a treaty authorizing it with some modifications.

In the Far East the Boxer insurrection in China had been followed by the combined military expedition of the powers to the relief of Peking (in which the United States shared), and the exaction of a huge indemnity, of which the United States relinquished nearly half of its share, as in excess of the actual losses The United States protested against Russian demands upon China, and actively participated in the negotiations which resulted in Russia's agreement to evacuate Manchuria. The delays of that power and her policy toward China having led Japan to declare war, Secretary Hay's diplomacy was influential in limiting the zone of hostilities, and the good offices of President Roosevelt brought about the conference between the two powers at Portsmouth, N H., which terminated hostilities in 1905. The dispute over the boundary between Alaska and Canada was narrowed by diplomatic discussion, and the remaining questions, involving the control of important ports at the head of the great inlets which offered access to the gold-fields, were settled by arbitration in 1903 favourably to the American contentions

The isthmian canal also received a settlement in this Administration by a process which was thoroughly characteristic of the resolution of President Roosevelt. *See* PANAMA CANAL.

The Philippines.—In the Philppines early in 1901 municipal and provincial governments were provided for, and the President had been for a brief time granted full power to govern the archipelago. He appointed Judge Taft civil governor, and limited the power of the military governor to regions where insurrection continued. On July 1, 1902, congressional authority was substituted for that of the President, but Taft remained governor The provisions of the Constitution guaranteeing life, liberty and property were in general extended specifically to the dependency, and a legislative assembly was promised, the lower house elective, and the upper house to consist of the Philippine commission. By negotiations with Rome Gov. Taft secured for the Philippines the "friars' lands" which had been a source of friction. On Oct. 16, 1907, the first Philippine assembly was convened in the presence of Taft, then secretary of war.

The tariff question complicated American relations with both the Philippines and Cuba. Beet sugar and tobacco interests feared the competition of these products, and opposed freedom of trade between the United States and the new territories. The Philippine tariff of 1902 made a reduction of only 25% from the Dingley tariff in the case of the products of those islands, instead of the 75% urged by Taft; but the duties were to go to the Philippines In the case of Cuba a more heated controversy arose over the tariff—Roosevelt strongly urged a substantial reduction in justice to Cuba at several regular and special sessions of Congress; but not until the close of 1903 was a treaty in operation which, under the principle of reciprocity, admitted some products of the United States to Cuba at reduced rates, and allowed Cuban products a reduction of 20% from the Dingley tariff.

The Trusts.—The dominant historical tendencies of the beginning of the 20th century in the United States, however, were characterized by huge combinations of capital and labour, the rapid passing of natural resources into private possession, and the exploitation of these resources on the principle of individualism by aggregations of capital which prevented effective competition by ordinary individuals. Pioneer conceptions of individual in-

dustrial achievement free from governmental restraint were adopted by huge monopolies, and the result was a demand for social control of these dangerous forces.

After the Sherman Anti-Trust Act of 1890 the combinations found in the favourable laws of States like New Jersey opportunity to incorporate under the device of the "holding company," which was supposed to be within the law. A "promotion mania" set in in 1901 The steel industry, after a threatened war between the Standard Oil and Carnegie groups, was united by Pierpont Morgan into the United States Steel Corporation with stocks and bonds aggregating $7,400,000,000. This was only one of the many combinations embracing public utilities of all kinds. Where open consolidation was not effected, secret agreements, as in the case of the meat packers, effectively regulated the market In the field of railway transportation, Harriman used the bonds of the Union Pacific to acquire the Southern Pacific with the Central Pacific, and by 1906 he was dictator of one-third of the total mileage of the United States. Meanwhile the Great Northern and the Northern Pacific had been brought into friendly working arrangements under James J. Hill, and tried to secure the Burlington railway A fierce contest followed between the Hill, Morgan and Harriman forces, resulting in a compromise by which the Northern Securities Company, a holding company for the joint interests of the contestants, was created. It was admitted by the counsel for this company that the machinery provided in this organization would permit the consolidation of all the railways of the country in the hands of three or four individuals. By using notes of one railway company, based on its treasury securities, one could acquire a controlling interest in others; and by watering the capital stock, recover the cost of the undertaking, while the public paid the added rates to supply dividends on the watered stock.

Following a similar tendency the great Wall street banking-houses were dominated by the large financial groups in the interest of speculative undertakings, the directors of banks loaning to themselves, as directors of industrial combinations, the funds which flowed into New York from all the banks of the interior. By a similar process the great insurance and trust companies of New York became feeders to the same operations. Thus a community of control over the fundamental economic interests of the nation was lodged in a few hands

Such was the situation in domestic affairs which confronted Roosevelt when he became President. In his first message he foreshadowed his determination to grapple with these problems. In 1903 he instructed the attorney-general to bring suit to dissolve the Northern Securities Company as a combination in restraint of trade, and in 1904 the Supreme Court held the merger illegal. But the effect was to increase the tendency to change from incomplete combination of financial interests to consolidated corporations owning the property, and to lead the Government, on the other hand, to seek to regulate these vast business interests by legislation. The Elkins law, passed in 1903, increased the power of the interstate commerce commission to prosecute offenders, especially those who violated the anti-rebating clauses. In the same year the creation of the Federal bureau of corporations provided for increased publicity in the affairs of these organizations.

Combinations of Labour.—Labour was combining in its turn. Not only did local unions in most of the trades increase in number and power, but workers in separate industries over large areas were combined for collective bargaining and a national organization, the American Federation of Labor, had a membership by 1905 of approximately 2,000,000. Labour legislation by the States increased under these influences, and political leaders became increasingly aware of the power of the labour vote, while employers began to form counter organizations to check the growth of the movement. In 1902 Pennsylvania members of the United Mine Workers of America struck. Inasmuch as their employers were the owners of the anthracite coal monopoly under the control of an allied group of coal-carrying railways, the contest was one of far-reaching importance, and soon brought about a coal famine felt throughout the nation. So threatening was the situation that President Roosevelt called a conference of the contestants, and induced them to submit their difficulties to an arbitration commission which, by its report, in the spring of 1903, awarded to the miners shorter hours and an increase of wages.

Steadily the United States enlarged its economic functions In 1903 Congress created a department of Commerce and Labor and made the secretary a member of the cabinet. The reports of this department gave publicity to investigations of the perplexing industrial conditions. The department of Agriculture enlarged its staff and its activity, investigating different plants and animals, ascertaining means of checking insect pests, advising upon the suitability of soils to crops, seeking new and better seeds, and circulating general information. The contemporaneous development of agricultural education in the various Western and Southern States whose agricultural colleges had been subsidized by land grants and appropriations by the Federal Government, and the experimental farms conducted by railways, all worked to the same end. The nation began also to awake to the need of protecting its remaining forests, which were rapidly falling into the hands of corporations by perversion of homestead and other land laws. President Cleveland had withdrawn large forest tracts, and in 1898 Gifford Pinchot was made head of a division of forestry in the department of Agriculture In 1901 the work was organized under a separate bureau, and four years later the national forests were placed under his management.

Reclamation.—The increasing demand for lands for agriculture led also, under Roosevelt, to the real beginning of national irrigation actively in the vast arid area of the Far West. The reclamation service was created by the act of June 17, 1902, which set aside the proceeds of the sale of public lands in 13 States and three Territories as a fund for irrigation works. The Government itself reserved timber and coal tracts, water powers and other requisites for construction, and sold the irrigated lands to actual settlers in small farms, while retaining title to the reservoirs and the works. The income from the reclamation fund between 1901 and 1910 aggregated over $60,000,000. By the use of suitable crops and dry farming agricultural occupation was extended into formerly desert lands.

Election of 1904.—In the election of 1904 the popularity of President Roosevelt, after his strenuous activity in challenging some of the strongest tendencies in American life, was put to the test. His political management exhibited the fact that he was trained in the school of the New York politician as well as in the reformer's camp, and he was easily nominated by the Republicans on a platform which endorsed his Administration, and made no promise of tariff changes The Democrats turned to the Conservative wing, omitted any reference to silver or the income tax, and nominated Judge Alton B. Parker, of New York. The issue of imperialism had been largely eliminated by the current of events and the anti-trust issue was professed by both parties In the outcome Roosevelt won by the unprecedented popular plurality of over 2,500,000, and an electoral majority of 196.

The State elections of the same period showed that a wave of reform and of revolt against former political forces was rising. In five States which Roosevelt carried by his popularity the machine Republican candidates for governor were defeated by reforming Democratic candidates, and in cities like Chicago and Philadelphia the issues of reform and radicalism won unexpected though temporary success. Roosevelt had "stolen the thunder" of the parties of social unrest, including the old populistic areas of the Middle West and the labour element of the cities, and also retained control of the Republican party machinery.

Roosevelt's Second Administration.—In his second Administration President Roosevelt pressed his policies so hard and with such increasing radicalism that he lost control of the regular organization in Congress before the end of his term. In the House Speaker Joseph G. Cannon, of Illinois, exhibited the full power of his office in concentrating party policies in the hands of the few regular leaders, while in the Senate a directing group of New England men who had served for a long time, chiefly senators Nelson W. Aldrich and Eugene Hale, showed a similar mastery. Against this control a significant revolt, illustrative of revived discontent in the Middle West, was made by the Republican senator Robert M. La Follette, of Wisconsin, who had won his fight in that State

against the faction friendly to the railways, and had secured primary elections, railway rate regulation on the basis of expert valuation of the physical property of the railways, and a system of taxation which rested more heavily upon public utilities In pressing similar policies upon Congress he became isolated from the party leaders, but forced them to go on record by roll calls.

In New York a legislative investigation of the insurance companies disclosed such connections with the high financing of Wall street as to create widespread distrust and to lead to reform legislation. The attorney who conducted the investigation, Charles Evans Hughes, had shown such ability that he was chosen governor of New York in 1906. His administration was marked by independence of the party machine and a progressive policy. Foreign relations were conducted during the second administration of Roosevelt by Secretary Elihu Root from 1905. He fostered friendly relations with the other American nations, allaying their concern lest ambitious designs of their larger neighbour might endanger their independence. In Cuba a signal illustration of the good faith of the United States was exhibited when an insurrection in the summer of 1906 left the republic substantially without a government. Taft, then secretary of War, was sent, under the treaty provisions for intervention, to organize a provisional Government. During his few days' service as governor-general he set in motion the machinery for restoring order. But Roosevelt had plainly stated that if the insurrectionary habit became confirmed in Cuba she could not expect to retain continued independence.

Japanese Immigration.—Attention was again fixed upon the Pacific coast, not only by the earthquake and conflagration which in 1906 destroyed the business parts and much of the residence section of San Francisco, but also by municipal regulations there against the presence of Japanese in the public schools. The incident seemed to threaten grave consequences, which were averted by the popularity of Roosevelt both in California and in Japan. In the Immigration Act of Feb 20, 1907, the problem of exclusion of Japanese labour, which underlay the difficulty, was partly solved by preventing the entrance to the continental United States by way of neighbouring countries of persons holding passports issued by a foreign Government for going to other countries or dependencies of the United States.

As a demonstration of the naval power of the United States in Pacific waters, the President sent the American fleet on a cruise around the world, in the course of which they were received in a friendly spirit by Japan. The Navy was increased to keep pace with the growth of that of other nations, both in numbers and size of vessels, in this period, but not to the extent demanded by the Administration. Already a more efficient organization of both Army and Navy had been effected. While the nation prepared for war, it also engaged prominently in the successive international peace congresses between 1899 and 1907, aiming consistently to increase the use of arbitration.

Railway Regulation.—The tendencies of the Government to deal with social improvement were exemplified by the laws of 1906 providing for pure food and meat inspection. The Railway Rate Regulation Act of 1906 strengthened previous interstate acts by including pipe lines (except for gas and water) under the jurisdiction of the interstate commerce commission, and extending the meaning of "common carrier" to include express and sleeping-car companies. Published rate schedules were required, not to be changed without 30 days' notice, and more stringent provisions were made to prevent rebating. The act provided for review by the Federal courts, and did not permit the commission to investigate an increase of rates until the rates went into operation, nor did it provide for a valuation of the railways as a basis of rate-making which the commission had desired. Later acts partly met the demands of railway employees by increasing the liability of common carriers and by providing for shorter hours.

Panic of 1907.—Although Roosevelt had made concessions to the railways in the formation of the act of 1906, his utterances showed a tendency alarming to the large business interests and the holders of corporation securities generally The unsettled business conditions were reflected in the stock market, and began to produce a reaction against the activity of Government in this direction The panic of 1907 started with the downfall of an attempted combination of a chain of banks, copper interests and other enterprises, and was followed by the collapse of the Knickerbocker Trust Company in New York (Oct. 21, 1907). The country was generally prosperous, though much of the banking funds was tied up in New York city at this juncture. Clearing-house certificates were resorted to; by Nov. 1 partial suspension was general throughout the nation; and banking facilities were more completely interrupted than at any time since the Civil War The Government greatly increased its deposits, and offered Panama 2% bonds to the amount of $50,000,000, and 3% certificates for $100,000,000, with the object of providing the national banks a basis for additional note issues But these were taken only to a small amount, as they proved useful for their moral effect chiefly. An enormous addition to the money supply was made in the course of the panic, both by governmental activity, gold imports and national bank-notes. The crisis was brought to a close before the end of 1907 by the vigour of the Government and the activity of the large financial interests under the lead of J P. Morgan, who finally entered the field to stop the decline, at the same time that his associates in the Steel Trust acquired possession of their last remaining rival of importance, the Tennessee Coal and Iron Co.

The reaction after the panic, and the loss of influence resulting from his announcement that he would not permit his renomination for the campaign of 1908, left Roosevelt unable to exercise the compelling power which he had displayed in previous years. Congress under the control of the Conservatives refused him legislation which he asked, but before he left the Presidency he raised a new issue to national importance in his calling of a congress of State governors and experts to consider the need of the conservation of natural resources. This congress met in May 1908 and endorsed the proposal for vigorous attention by State and nation to the question

Election of 1908.—In the campaign of 1908 he succeeded, against the opposition of both the extreme Conservative and the Radical wings, in procuring the nomination of Secretary Taft by the Republicans on a platform endorsing the Roosevelt policies, promising a revision of the tariff at a special session, on the basis of such protection as would equal the difference between the cost of production at home and abroad, together with a reasonable profit to American industries, and providing for maximum and minimum rates to be used in furthering American commerce and preventing discriminations by other nations. A postal bank was promised, a more effective regulation of the railways, and a modification of the Sherman Anti-Trust Act. The Democrats again selected William J. Bryan as their candidate; demanded the enforcement of criminal law against "trust magnates" and such additional legislation as would prevent private monopoly; opposed the use of injunctions in cases where they would issue if no industrial dispute was involved; impugned the Republicans' good faith in tariff revision, promising for themselves a substantial reduction of duties; favoured an income tax and a guarantee fund by national banks to pay depositors of insolvent banks, or a postal savings bank, if the guaranteed bank could not be secured; demanded election of United States senators by direct vote of the people, legislation to prevent contributions by corporations to campaign funds, and a more efficient regulation of railways.

Taft President.—The Republicans won a sweeping victory, Taft's popular plurality reaching about 1,270,000 and his electoral majority 159. But it had been won by some ambiguity of utterance with respect to tariff and railway regulation. The result was made manifest early in the new Administration, when party contentions over the direction of revision of the tariff, the thoroughness of the regulation of railways and corporations, and the question of where the postal bank fund should be placed, resulted in a movement of "insurgency" among the Republicans of the Middle West. The insurgents termed themselves "Progressive Republicans," and did not hesitate to join forces with the Democrats in order to shape legislation to their wishes. Progressives and Democrats united in overturning the control of Speaker J. G. Cannon in the House of Representatives by modifying the rules,

and a group of senators, chiefly from the middlewestern states, destroyed the control of the regular leaders in the upper house President Taft's influence over the revolting wing was further weakened by the charges made against his secretary of the interior, Richard A. Ballinger, on behalf of Gifford Pinchot, the chief forester, who accused the administration of obstructing Roosevelt's "conservation" policy.

Pinchot was indeed removed from office, but the "conservation" issue was raised to primary importance by the return of Roosevelt from his African trip. His influence was revealed even while he was enjoying the hospitality of European countries. On his return, there was a widely extended desire to know his judgment of the administration's policy; but he maintained silence until the close of the summer of 1910, when in a series of public utterances in the west he ranged himself, on the whole, with the progressive wing and announced a "new nationalism" which should enlarge the power of the federal government and drive the "special interests" out of politics. The "insurgents" achieved remarkable victories in the middle west, California, New Hampshire and New York in the fall conventions and primary elections, retiring various leaders of the regular wing of the Republicans Senators Aldrich and Hale, former regular leaders in the senate, had already announced their purpose to resign. The result of the autumn elections was a pronounced victory for the Democratic party.

Social Questions.—At the close of the first decade of the 20th century the United States was actively engaged in settling its social and economic questions, with a tendency toward radicalism in its dealings with the great industrial forces of the nation. The "sweatshops" and slums of the great cities were filled with new material for U S. society to assimilate To the sisterhood of States had been added Oklahoma (1907), and in 1910 congress empowered New Mexico and Arizona to form constitutions preparatory to statehood, thus extinguishing the last territories, except the insular dependencies and Alaska. Already the food supply showed signs of not keeping pace with the growth of population, while the supply of gold flowed in with undiminished volume. High prices became a factor in the political situation. Between 1890 and 1900, in the continental United States, farms were added in area equal to that of France and Italy combined. Even the addition of improved farm land in that decade surpassed the whole area of France or of the German empire in Europe But intensive cultivation and agricultural returns hardly kept pace with the growth in population or the extension of farms (F. J. T.)

FROM 1910 TO ENTRY INTO WORLD WAR I

The Nation in 1910.—The total population of the continental United States in 1910 was 92,000,000. Of these, only 50,000,000 were native whites of native parentage; 13,000,000 were foreign-born, and 19,000,000 others were of foreign-born or mixed parentage The Negroes and Indians together numbered about 10,000,000. Everybody in the United States except the American Indian was an immigrant from some other country or a descendant of an immigrant. The main race groups were: (1) the descendants of the colonists, who were mainly Anglo-Saxons, with some Germans and Scotch-Irish and small elements of other races; (2) descendants of the Europeans who came over in great numbers from 1820 to 1870; (3) the large number of later immigrants and their children.

In the opening years of the 20th century the country was not yet aroused to the problems arising from this mixture of unassimilated races Few voices were raised against admitting not only western Europeans, whose languages and customs were much like those of the United States, but men and women from east and southeast Europe and from western Asia. The only bar to immigration based on race was the prohibition, after 1888, of Chinese immigration and the practical exclusion of Japanese labourers by a "gentlemen's agreement" with the Japanese government (1907) The undigested load was becoming heavy.

Defects in Government.—The units of U.S society were held together by a strong, if complicated, democratic government, well fitted to rule a diverse population. The political forms were familiar to every schoolboy: (1) a group (in 1910) of 46 states, each with its own government rigidly confined by the traditional principle of "checks and balances" into three departments, legislative, executive, judicial; (2) a widely distributed franchise almost equivalent to universal suffrage for adult males; (3) a belief that the courts were the highest authority, not only as to questions of personal rights and duties, but as to the validity of the laws and acts of the other two departments; (4) local government of city and town, township and county. Thus combination of governments was expensive and not highly skilled, but was supported by the conviction of a large part of the population that it was the "best government on earth."

In the organization and conditions of business there could be traced some startling contradictions between the word liberty and the fact Nominally all kinds of business not prohibited by law were open to all comers in free and honourable competition. In reality, by 1908, a considerable number of both employers and employees were engaged in a combat outside the laws, constant and conscienceless. It was hard for individuals and firms to compete with corporations, and hard for small corporations to compete with large ones The railways were among the most conspicuous of the large corporations, and they, too, tended to combine into larger and more powerful units The states could not deal adequately with these powerful bodies because most of the railways and many of the other corporations operated from state to state, and could not be controlled at either end by anything short of federal power.

Political organizations were on nearly the same basis as business companies. they also grew bigger and more powerful and gathered into fewer groups Nominally, parties are simply associations of voters for common ends. Actually, they are armies acting under commanding leaders who in many cases hold no offices The evils of this "invisible government," as Elihu Root called it, were apparent. The political philosophy of Americans was based on the belief that mankind was steadily growing better Hence a tendency to rely upon laws and political devices for correcting the ills of popular government What was most needed was the leadership of bold and farseeing men.

Finances and the Tariff (1908–13).—Every growing unit in the country was harassed by questions of taxation and expenditure The U S. government also sought new resources, and found them in the income tax. This was made possible on July 13, 1909, by the 16th amendment to the constitution, which came into effect on Feb. 25, 1913. Another new resource of the federal government was a tax upon corporations levied on net income (Aug. 5, 1909) The important question of reorganizing the national banking system, so as to furnish a strong national institution, was debated from 1908 to 1912, and was the subject of an elaborate report by a national monetary commission; but no action was taken at that time The net federal debt was $1,000,000,000, or only about $11 per head of the population.

A financial resource over which congress had sole authority was the tariff. Under strong pressure from members of the party to carry out the promises of the Republican convention of 1908, President Taft, a few days after his inauguration, summoned congress to meet in special session, for a revision of the tariff. As usual there was a long controversy, which resulted (Aug. 5, 1909) in the Payne-Aldrich tariff. The act created a permanent court of customs appeals, with power to determine finally all questions as to the value of imports, together with a tariff board, expected to make investigations and recommend specific measures which congress might adopt As to rates, the act was not very different from its predecessor, except for a decided increase of duties on cotton and silk manufactures There was a loud outcry that the revision intended by the party platform was a revision downward and not upward Nevertheless President Taft signed the bill, and in a speech at Winona, Minn , Sept. 17, 1909, surprised the country by declaring that it was the "best tariff bill that the Republican party has ever passed."

Political Reform (1908–13).—When Roosevelt left the presidency in 1909 the position of president was at the highest point of authority that it had ever known. Most presidents had found their principal legislative influence in the veto; Roosevelt had followed the McKinley method of emphasizing his wishes in personal discussion with members of congress. He did more: he revived the Jacksonian method of announcing a legislative plan, and if congressmen hung back, of appealing over their heads to the country at large A similar policy was adopted by President Taft, who had many of the qualities of leadership. He was large, happy, genial, fond of his many friends, a cheerful, balanced man. He had served as first civil governor of the Philippines and

as secretary of war in the cabinet of Roosevelt, who practically designated him as his successor Nevertheless, as an avowed inheritor of Roosevelt's policies, he drew upon himself the opposition of Roosevelt's enemies while it soon became apparent that he was not relying upon Roosevelt's friends

At this time the "primary" method of selecting candidates was spreading rapidly through the union. Candidates for each party were selected by the ballots of the people, thus undermining the convention system From nominations for local officers the new method had spread, by 1911, to state officers in numerous states; and after 1910 it began to be applied to the choice of delegates to the national party conventions. An unforeseen effect was that the official ballots were made upon the basis of party nominations, with an opportunity for independent voting. The primary thus became a part of the system of public elections, and therefore the party system was engrafted on public law, as a part of the government

The distrust of conventions and controlled elections extended to the numerous and powerful bosses in city and state legislatures. Three new devices were set at work to curb them and to interest the electors in public measures The first of these, the referendum (*q.v.*), was by 1909 spreading rapidly through the western states, as a means of checking legislative action contrary to public sentiment. The referendum system furnished a mechanism, usually imbedded in state constitutions, by which on the demand of a sufficient number of voters, a statute could be held back from effect until submitted to a vote of the electors What was to be done if the legislature refused to enact a statute demanded by the people? The initiative (*q.v.*) was invoked, by which a designated number of voters could unite on a measure, which must then be submitted to the electors for their suffrages

A third branch of this system of appeal to the people was the recall (*q.v.*), under which a public officer already chosen by popular vote (and in a few cases those who were appointed in some other way) could be subjected to an election; and, should the majority decide against him, be thereby removed from office In 1911–12 the question came up in connection with the proposed constitution of the new state of Arizona, which included a provision for the recall of judges. Because of this provision President Taft vetoed the act of admission. The state withdrew the clause, was duly admitted in 1912, and thereupon proceeded to reinsert the recall

A still wider application of the principle of the responsibility of functionaries to the voters was the recall of judicial decisions, which was advocated by Roosevelt in 1912, but proved to be more than the country desired.

United States senators, till then chosen by state legislatures, were next made subject to popular choice. Urged by public sentiment, congress submitted (June 12, 1912) the 17th amendment, which was duly ratified and added to the constitution (May 31, 1913). Under this, all elections to the senate were to be made by direct popular vote Another evidence of a rising feeling of responsibility in congress was a statute (Aug. 7, 1911) requiring candidates for the house and senate to submit statements of the money raised and expended in their behalf and limiting the amount which they themselves might spend. One purpose of both these measures was to make it difficult for men to purchase their way into the senate. On July 13, 1912, Sen. W. Lorimer of Illinois was practically expelled from the U.S. senate for buying votes in the legislature.

Another slow reform was in the ballot system. Most cities, towns and states were loaded down with long lists of the officers to be chosen. The result was an agitation for the reform commonly known as the short ballot, by reducing the number of elective officers and increasing the officers to be appointed by the few elective officials. Working difficulties were found in many of these reforms. It was hard to keep the public keyed up to the necessary pitch of thought and attention at every election; but it was evident that the American people intended to free themselves from the shackles of "invisible government."

Social Questions (1908–12).—The spirit of discontent extended to many questions outside of politics. Throughout the Taft administration there was an increasing pressure for equal suffrage —that is, woman suffrage—which, introduced in the territory of Wyoming in 1869, had gradually spread among the far-western states, and then begun working its way eastward Again, both state and national governments were compelled to deal with the question of alcoholic beverages From the earliest times there had been restriction on liquor selling and liquor sellers By 1909 in almost all states there was some form of general legal restriction —prohibition, local option, high licence or a state dispensary system. The question became national, because the liquor trade transported its wares from one state to another; and that brought it within the interstate commerce clause of the constitution and the Interstate Commerce act Eventually by the original Package act of 1890, congress adopted the policy of prohibiting shipments of liquor into prohibition states. Pure food laws in force before 1909 were supplemented by the Drug Label act of 1912, which greatly aided in preventing the adulteration of drugs.

Many questions arose out of immigration. The laws in 1909 forbade the entry of labourers under a contract to work in the United States, of convicts, diseased persons and the insane, but the execution of the laws was slack. The first statute looking toward decided control of immigration was that of Feb. 1907, which increased the grounds of exclusion, and at the same time provided a plan to help the immigrants in finding work. It also created an immigration commission, which in 1910 made a report in 41 volumes, strongly recommending the sifting of immigrants by testing their ability to read and write some language. Meanwhile, in the decade 1901–10 the number of immigrants rose to an average of 1,000,000 a year. Later, however, the record showed that from 300,000 to 500,000 annually returned to their old homes, the actual rate of increase of population by immigration was no more than about ½% annually.

Labour Questions.—No legal obstacle stood in the way of the right to organize, first, by local trade unions, then by nation-wide unions for single trades, and finally by national unions combining many trades To this was slowly added by the unions the principle of the "right to labour," which meant both that it was the duty of the community to see that the worker had a job and that at least the skilled workers had a kind of title in their employment, so that it became contrary to good morals for a "scab" to take the place of a striker.

The legal position of labour unions in these controversies was brought out by suits of national importance against unions In the test case of *Gompers v. Buck's Stove and Range Co.*, the charge was that the federation, by posting the company in its publications as "unfair to labour," was boycotting, and thus infringing legal rights Samuel Gompers, president of the American Federation of Labor, was convicted for contempt of court on the ground that he had refused to obey a court order to abandon the boycott. In 1908 a suit was decided with a verdict of $74,000 damages against a union of the hatters of Danbury, Conn , who had attempted to boycott the products of a local hat manufacturer.

Another phase of the labour situation was the spread of employers' liability laws through various states, and the passing of an act of congress (April 22, 1908) for the protection of the employees of interstate railways. In June 1912 congress added to its previous enactment of an eight-hour maximum regular day for public employees, by providing that all contract work for the federal government must also be on the eight-hour basis. As most labourers were voters they brought powerful influences to bear on state legislatures and on congress in favour of labour. On the other hand, the courts, particularly those of the states, were slow to recognize the changes in industrial conditions.

In addition, the courts began to use a system of labour injunctions: workmen, labour unions and their members were ordered to abstain from committing acts which if committed would presumably violate a law and would thus lead to a prosecution, in which the question of guilt could be settled by a jury. Instead; the courts by injunction would decide on the responsibility and affix a penalty not specifically laid down in any statute.

Trusts and Transportation 1887–1912.—During the 20 years ending with 1910 it became clear that the most difficult question

before the United States government was the regulation of the vast aggregates of capital, commonly called trusts (*q.v.*), which combined into corporations, aimed at the control of particular lines of business, and also of the railways. The efforts of congress to adjust the question were registered in two lines of restrictive statutes, headed by the Interstate Commerce act of 1887 and the Sherman Anti-Trust act of 1890. Upon these was built a structure of decisions by the United States supreme court. To carry out and partly to avoid these decisions, the Mann-Elkins act of June 18, 1910, widely extended the Interstate Commerce acts by including telephones, telegraphs, express and sleeping-car companies, and setting up a commerce court which was to render decisions on transportation questions Federal control of railways on the whole worked well The commission was a striking example of disregard of the principle of separation of powers, inasmuch as it was a rule-making body, an executive body and a court which interpreted its own rules, subject as to some questions of appeal to the federal courts.

The great problem of the trusts was much farther from a solution than that of the railways, because the large corporations were linked together through the holding and manipulation of stocks by capitalists and banks, and through the so-called "interlocking of interests" The only effective way of dealing with large corporations whose activities extended from state to state was to bring suit against them for monopolizing or conspiring to monopolize in their lines of trade. It was considered a triumph when (May 9, 1911) the United States supreme court rendered decisions against two of the most powerful trusts—the Standard Oil company and the American Tobacco company. The court held that the antitrust legislation must be interpreted by the "standard of reason"—namely, that a combination was not unlawful or against the public interest unless it actually caused a restraint of trade and commerce among the federal states or with foreign nations. Having thus set up a "rule of reason" which congress had refused to enact, and having created an example of judicial legislation, the court proceeded in both the pending cases to hold that the companies were guilty of attempts to monopolize their lines of trade. As to penalties, the court contented itself with ordering the offenders to disintegrate. The general danger of vast aggregations of capital was ignored.

Foreign Affairs.—The fields of the diplomacy of the United States for many years had been American and Pacific, and in a much smaller degree European. In the second Hague conference of 1907 the United States delegates urged international arbitration; and in accordance with the general principles put forth at that conference, Elihu Root as secretary of state secured 25 arbitration treaties with as many countries (1908). The United States and Great Britain arranged (Jan 27, 1909) to refer to The Hague tribunal their long-standing dispute on the Newfoundland fisheries. The result was a decision acceptable to both sides (Sept. 7, 1910). In 1911 the Republican majority under President Taft's leadership initiated a policy of commercial reciprocity with Canada An agreement was made with the Canadian government by which each side should by legislation reduce or abolish duties on certain raw products and manufactures. With great difficulty the necessary bill was pushed through congress (July 1911); but two months later the Canadian electors refused to support the reciprocity agreement, and the plan broke down.

Latin America.—Notwithstanding the position of the United States as the responsible holder of the Philippine Islands, and hence an Asiatic power, the tradition of isolation continued to be a strong force in the public mind. Nevertheless no formidable public protest was made to a policy of special U.S. intervention in Mexico, the Caribbean and the Isthmus region. The arrangements of 1902 made Cuba practically a dependency, subject in the last resort to decisions from the White House. President Taft continued the occupation of the Dominican Republic; consent of the senate under a treaty to that effect having been obtained by Roosevelt in 1907. In 1911 Taft secured a convention by which Nicaragua gave exclusive canal privileges to the United States.

The Panama canal was now approaching completion and the little republic of Panamá, which it bisected, though nominally an independent state, was in fact under U S control. An act of congress (Aug 24, 1912) laid tolls on shipping, from which U.S. ships engaged in coastwise trade were to be relieved The British government lodged a protest on the ground that by its treaty with the United States the canal was to be opened on equal terms to the ships of "all nations"; President Taft, however, stood by the act, and the question was passed on to the next administration

Still more serious were the relations with Mexico, where, in 1910, a revolution headed by Francisco Madero assailed the government of Porfirio Díaz and drove him after a few months out of the country. Mexico was thrown into confusion, and President Taft found it necessary to place troops on the border In 1912 he proclaimed an embargo on the export of arms or military supplies to Mexico Meanwhile the concessions and property of Americans in Mexico were threatened or destroyed. The Americans who had interests in Mexico began a steady pressure for intervention by the United States.

Pacific Relations 1908–12.—Across the Pacific, clouds rose on the diplomatic horizon The commercial treaties with Japan allowed a reciprocal freedom of residence and trade to the nationals of the two countries. The immigration of Japanese was very distasteful to the people of California, who undertook to restrict Japanese children to separate schools Behind this difficulty was the rising power of the Japanese and their national spirit, greatly enhanced by their victory over the Russians in 1905. In 1908 Roosevelt sent round the world a powerful naval fleet, which visited Japan and was received with elaborate courtesy by a welcoming Japanese squadron exactly equal in number, ship for ship. In the Root-Takahira reciprocal note of Dec. 1, 1908 (which was never submitted to the senate), the United States practically admitted Japan's special interest in Asiatic affairs The question of Japanese immigration was settled for the time being by a renewal of the commercial treaty (July 24, 1911). It continued the previous "gentlemen's agreement," according to which, though claiming a right of immigration into the United States, the Japanese government pledged itself not to issue passports to labourers.

Politics 1909–12.—In the action of congress on many of the important issues above discussed no party lines were drawn, though such measures as the tariff and new taxes were distinctly Republican. On the tariff, some members from middle western states, particularly Minnesota, voted against the Payne-Aldrich measure of 1909. Another disturbance was caused by resentment against the speaker of the house, Joseph Cannon of Illinois, who through the union of various powers virtually had a veto on any measure or proceeding which he did not like. Cannon kept too tight a hand; hence (March 19, 1910) a group of Republican "insurgents" joined hands with the Democrats to reduce his prerogatives till Cannon became simply a partisan moderator.

A new issue upon which both parties were divided was covered by the general term "conservation" Although most of the arable land had passed out of its possession, the federal government was still the possessor of great tracts of forest, of mineral lands and of water power. Congress in 1902 provided for a system of irrigation, the cost to be advanced by the government and repaid in instalments by the users of the water. President Roosevelt became interested in stopping the waste of timber and minerals, in preserving part of the gifts of nature for future generations and in retaining public ownership of the utilities of the country, particularly the forests and streams. In 1910 new statutes provided for a fresh classification of land and for the reservation of coal by the government.

Roosevelt and Wilson.—By 1910 it became clear that the Republican party was weakening, and that President Taft's popularity and influence were lessening. The state and congressional elections of 1910 were unfavourable to the Republicans. The insurgents, who soon came to be called Progressives, gained most of the Republican districts in the west, and the Democrats gained about 50 seats in congress. This result transferred to the Democrats the control of the house, while in the senate they secured 41 of the 92 members.

A group of dissatisfied Republicans gathered about Sen. Robert

La Follette of Wisconsin as a leader and presumptive candidate for president Meanwhile state legislatures were passing primary laws which included the election of delegates to national nominating conventions This made it easier to break through the old-line organizations, as La Follette had done in his own state Taft's friends and supporters naturally expected that the president would be renominated

All these calculations were disturbed by the greatest personality in the country, Theodore Roosevelt. A few weeks after leaving the White House (1909) he started on an expedition to Central Africa, and was, on his way back, received in Europe as the former president of the most important of republics and as a commanding personage. He returned to the United States (June 18, 1910) to find political conditions little to his liking Most of his friends had disappeared from the administration, his policies seemed to him to have been slighted Taft did not satisfy the former president, and the two drifted apart. On Aug 31, 1910, at Osawatomie, Kan , Roosevelt set forth a program which he called "the New Nationalism," favouring publicity of the accounts and proceedings of trusts, a tariff commission, a graduated income tax, an adequate army and navy, conservation, protection of labour and the direct primary with the recall of elective officers For the time being Roosevelt made no direct movement toward standing for the presidency Meanwhile several of the western states, particularly California under the guidance of Gov Hiram Johnson, accepted a radical program of political and social reform A formal breach with Taft and the open candidature of Roosevelt seemed inevitable The crisis came when (Feb 12, 1912) President Taft in a speech alluded to the Progressives (evidently having Roosevelt in mind) as "Extremists—not Progressives; they are political emotionaries, or neurotics" This was taken as a challenge, and a few days later Roosevelt openly declared himself a candidate

The Election of 1912.—As the convention held in Chicago approached, the lines of battle were developed. Behind Taft were William Barnes of New York, Boies Penrose of Pennsylvania, Winthrop Murray Crane of Massachusetts and other "standpat" leaders Among those in favour of Roosevelt were James R. Garfield of Ohio, Gifford Pinchot of Pennsylvania and a strong body of Republican governors. Roosevelt himself went to Chicago, and threw his immense energy and enthusiasm into the campaign The convention was a scene of unusual excitement

The critical decision was made in the preliminary meetings of the national committee, which was strongly "standpat"; for that committee had to decide upon the right of claimants to be inscribed in the preliminary roll of delegates. Every contest except one was settled in favour of the Taft claimants. The shifting of 30 delegates from one side to the other would have brought about a stampede to Roosevelt, but they were not to be had. Roosevelt advised his delegates to take no further part in the proceedings. At the final roll call, June 22, there were 561 votes for Taft, 58 scattering and 107 for Roosevelt, besides 344 Roosevelt men not voting. In the last issue, therefore, Taft had a majority of 50 votes out of 1,070. In the minds of Roosevelt and most of his followers the nomination was a violation of the principles of popular government. Roosevelt openly advised a bolt. This was duly accomplished by a formal Progressive convention. It met in Chicago in August and nominated Roosevelt for president and Hiram Johnson for vice-president.

Meanwhile the Democratic convention met at Baltimore with William J. Bryan in a position to dictate the choice. The apparently sure candidate was Champ Clark of Missouri, speaker of the house of representatives. But under the rules of the Democratic convention requiring a two-thirds majority, he was finally defeated by Woodrow Wilson, governor of New Jersey The platforms of the two old parties were of the usual type. The Republicans declared for protective duties. The Democrats stood by their platform of a tariff for revenue only, additional regulation of the railways and presidential preference primaries. The Progressive platform was a general program of political reform and "an enlarged measure of social and industrial justice."

Woodrow Wilson's Victory.—Not platforms, however, but men, appealed to the voters All three candidates took the field. From the first it was clear that the real fight was between Roosevelt and Wilson The Progressives were well organized, and their convention and campaign included many women The final question was whether Roosevelt could draw to himself a sufficient number of Democrats to reduce the Democratic vote below the winning point. The result in November showed that the Democrats in the main stood by their party candidates The total popular Democratic vote, 6,293,454, was only about 115,000 less than in 1908. The total Taft and Roosevelt vote combined was almost exactly the same as that of the Republicans in 1900 Roosevelt polled 4,119,538 popular votes to 3,484,980 for Taft; but he carried only 6 states, with 88 electoral votes, against 2 states with 8 votes for Taft and 40 states with 435 votes for Wilson

Woodrow Wilson.—On March 4, 1913, Wilson was inaugurated as president. Born in Staunton, Va , in 1856, of Scotch Presbyterian ancestry, he graduated from Princeton in 1879, essayed the practice of law, then was a professor in several colleges. From 1902 to 1910 he was president of Princeton university He was an easy and attractive speaker and had a remarkable literary style. (*See* WILSON, THOMAS WOODROW) As governor of New Jersey during 1911 and 1912 he had opportunity to show his skill as a party leader and his interest in reform In 1912 he was taken up by Bryan, who saw in him an exponent of the political principles for which Bryan had stood and a president who could meet the Progressives on their own ground

In making up his cabinet it was only reasonable that Bryan should enter it. He was made secretary of state, an office for which he had little adaptation. To a new cabinet office recently created by congress, the secretaryship of the department of labour, Wilson appointed W. B. Wilson, a strict labour organization man. Lindley M Garrison, secretary of war, and Franklin K Lane, secretary of the interior, were strong men Albert S. Burleson, postmaster general, and Josephus Daniels, secretary of the navy, had insufficient training for their duties David F Houston of Missouri was made secretary of agriculture, William G. McAdoo, secretary of the treasury, and James C. McReynolds, attorney general. Most of the members of the cabinet were men who could be trusted to follow the president's lead. One remarkable statesman not included in this list was Col E M House of Texas, who for six years was the president's most trusted counsellor and political friend without holding any political office In the minor civil service Wilson carried out his principles by enlarging the classified list of posts which could be entered only by competitive examinations.

A genial man, who could be a delightful companion, full of experience and of Scotch Presbyterian humour, President Wilson had a powerful mind, an amazing skill of expression and an intense belief in the power of ideals to arouse and inspire a people. He thought he had no need of conferences, of feeling the public pulse, of mixing with members of congress and party leaders, of personally greeting the average voter.

Finance and Tariff, 1913.—The election of 1912 carried with it a safe Democratic majority in the senate and a two-to-one majority in the house. On April 8, 1913, the president created a surprise by appearing in person to address the two houses of congress jointly at the opening of a special session, instead of sending a written message. This practice he followed throughout his administration, with great effect. He felt himself not only chief magistrate of the nation, but head of the Democratic party, and practically the premier of the government from which ought to proceed plans for important legislation.

A special session was called particularly to frame a tariff act. Rep. Oscar Underwood (Ala.), chairman of the committee of ways and means, gave to the new measure his name and experience. The purpose of the statute was to enlarge the free list of raw materials, foodstuffs and some manufacturers, to make a moderate reduction of the protective duties and to correct some of the things which made the Payne-Aldrich act unpopular. Included in the statute was an income tax, at last made possible by the adoption of the 16th amendment (Feb 25, 1913), which was expected to supply any revenue which might be lost by the reduc-

tion of duties A tariff commission was created to make researches into the workings of the act and to find out what was the actual difference between the cost of labour in the United States and in other countries (Oct 3, 1913).

The powerful influence of the president was again exerted to secure a systematic banking system, with the result that (Dec. 23, 1913) the Owen-Glass Federal Reserve Bank act was added to the statutes. The principle was to create a national institution, which was to be divided into 12 regional banks, in each of which was a body of directors, besides the central organization in Washington, D.C. In these 12 subdivisions clustered such banks, whether national or state-chartered, as chose to accept. The new institution was also to issue a new form of paper money The system from the start was recognized as a large national asset. At the same time a Rural Credits act was passed (July 17, 1916), which created a special group of banks to lend money to farmers on the security of their farms

Transportation, 1914–16.—Under a statute of March 1, 1913, the Interstate Commerce commission was authorized to enter on an elaborate valuation of the railway property throughout the country as the basis of a judgment as to what was a reasonable profit. The Panama canal was now approaching completion This was the first great agency of transportation owned and managed by the United States government. President Wilson used to the utmost his personal influence for a bill to repeal discrimination in favour of U S.-owned vessels, of which the British government had complained; it became an act, June 15, 1914. On Aug. 15 the first steamer passed through the canal from sea to sea and in a few months the canal was paying its own way A new question of transportation was arising through the rapid development of motor vehicles. At first a plaything, then a luxury, by 1908 they were spreading throughout the land The attention of the whole country was called to the absolute necessity of good roads In 1916 congress passed an act appropriating approximately $85,000,000 to be paid in about five years to such states as would contribute equal sums for good roads From this beginning the movement spread rapidly throughout the whole country.

The Trusts, 1914.—A few hours before the end of President Taft's term a congressional committee reported against the "great and rapidly growing concentration of the money control and credit in the hands of a few men" In June 1914, in a suit involving the International Harvester company, the United States supreme court upheld state antitrust laws.

Yet the trusts still flourished; and huge corporations, such as the U S. Steel corporation, paid dividends on thousands of millions in stocks and bonds. President Wilson urged successfully a radical amendment of the Sherman act (Oct. 15, 1914) against discriminating freight agreements, interlocking directorates and holding corporations.

Another branch of the same attack on the money power was the Federal Trade commission, created Sept. 26, 1914, which was an attempt to find means of dealing with corporations engaged in interstate commerce other than banks and common carriers.

In the same direction went the blue-sky laws passed in this period by many states, to break up the practice of floating the stock of companies which had no property more substantial than the atmosphere.

Labour, 1913–17.—The example of capital, in rolling itself into masses too great to be controlled by ordinary means, was followed by labour. The American Federation of Labor was a loosely woven council of representatives from the great trade organizations. It did not undertake to call strikes, though it was likely to support them, and it had great effect in bringing about combined and simultaneous demands for the various items in the labour program. The leaders fixed upon an eight-hour day as the basic working time. The next item was the minimum wage, which made its way slowly and was not altogether acceptable to labour. Another demand was that U.S. citizens should have preference over aliens in employment. Labour in general was unfriendly to child labour and was, therefore, interested in a federal statute of Sept. 1, 1916, to prevent the transport of products made by child labour under specified conditions.

As the labour unions gained in numbers and strength they used their energies in favour of the closed shop, a system under which union men refused to work in any establishment where men not members of the union were also employed. From this idea rapidly developed the system of sympathetic strikes, in which members of one union back up another union by refusing to handle, use or transport products of nonunion labour. Hence boycotts, and perhaps ruin for employers who had no difficulty or quarrel with their own workmen Never in the prior history of the U.S had there been so many and so violent strikes as from 1913 to 1917. The I W.W. organized long and tumultuous strikes among the silk weavers of Paterson, N J , and the textile workers of Lawrence, Mass In the trying years of 1916–17 violent strikes were directed not only against nonstriking workmen, but against the public peace In July 1917, at Bisbee, Ariz., the tables were turned. A kind of vigilance committee seized and carried out of town, with orders not to return, about 1,200 striking miners and their friends No jury would convict those responsible for this illegal action The most serious of all these labour struggles was the threatened strike in 1916 of the large and very powerful unions of railway employees President Wilson intervened and practically compelled congress to pass (Sept. 3, 1916) the Adamson act by which a basic eight-hour day was secured with pro rata for overtime. The supreme court upheld this statute, which went to the farthest verge thus far of the federal government's authority over labour matters

Social Movements, 1913–17.—These struggles between the railways and the courts, between the trusts and congress, between labour and state governments, between strikers and the president of the United States, are part of U.S. history because they were vital to the welfare of the country. The farmers everywhere were aroused, for they looked on railways as hostile to their interests, by overcharging for carrying their products; and they resented the trusts, which they believed raised prices The antiliquor forces steadily developed strength They urged out-and-out prohibition and secured it in more than half the states. At the end of 1917 war prohibition was enacted by the federal government and also prohibition in the District of Columbia On Dec. 19, 1917, a two-thirds majority was secured in congress for a prohibition constitutional amendment—the 18th amendment—which was at once submitted to the states. Woman suffrage also advanced steadily. Congress submitted a woman suffrage amendment in 1919 Thus changes that had been 50 years on the way finally were brought about by the force of public opinion. A change was also visible in the attitude of the country toward immigration which congress was determined to reduce by an intelligence qualification. A new bill (Feb. 5, 1917) was passed over Wilson's veto Besides a literacy test it raised the head tax to $8 and excluded oriental labourers coming from certain geographical areas, which did not include Japan but did apply to Hindus and Malays.

Educational Progress.—The several years following 1909 were marked by a new sense of the possibility of general education, and the need for a more direct, searching and practical type of education The country was accustomed to a system of graded public schools, offering the "common school education," and leading up to a few endowed and private schools, and to thousands of public high schools, which were expected to prepare the small proportion of young men and women who went on to institutions of higher education. Secondary education was subdivided into literary, commercial and industrial schools. The institutions of higher learning set up new professional departments, including the intensive study of education and separate schools of science, engineering, agriculture and other specialties. Private enterprise created a great number of so-called business colleges, and a few very efficient trade schools.

Nevertheless there was general complaint that the schools did not relate themselves to the life of the community. A National Society for the Promotion of Industrial Education became the focus of a movement to organize what now became generally known throughout the country as vocational education. A na-

tional commission was appointed by President Wilson, in 1914, to consider the whole subject. The resulting Smith-Hughes act (Feb 23, 1917) created a federal board for vocational education which framed an elaborate plan for instruction in the four vocational fields of agriculture, commerce, industry and homemaking

The act promised to appropriate federal funds to be paid to such states as would match these funds dollar for dollar

Private enterprise accompanied this movement by building up advanced engineering and trade schools of a high type, such as the Carnegie institute at Pittsburgh; by improving the private commercial schools and by establishing advanced schools of business training in colleges. Some of the great manufacturers, especially of automobiles, set up schools within their own works

When the United States plunged into World War I in 1917, the government established a variety of vocational schools to train men for the numerous specialties of military service It made use of the shops and other vocational facilities of the existing schools and colleges Great sums were raised by special drives among the alumni and friends of the endowed institutions, and the state universities were allotted hitherto unheard-of grants The strictly vocational schools were admitted into fellowship with the other institutions.

Wilson's Foreign Policy.—Woodrow Wilson was naturally a man of peace, and so emphatically was Secretary Bryan They set themselves to aid the cause of general peace by arbitration treaties Secretary Bryan prepared a definite project for treaties by which the nations concerned should, in case of difficulties, pledge themselves to submit their grievances and claims to a special examining commission and to abstain from war or preparations for war until the commission should have had time to report. The presumption was that a sensible nation would submit to the judgment of an impartial tribunal There was little difficulty in concluding more than 30 treaties upon this basis in the course of a year, but none was put into effect The truth was that the American people, as a whole little accustomed to international questions, had no definite foreign policy.

Philippines and Caribbeans.—The government of the Philippine Islands was altered by setting up the first Filipino assembly in 1907. In response to the pleading of President Taft, congress in 1909 grudgingly included them within the customs boundary of the United States Under President Wilson, Gov. Gen. Cameron Forbes was withdrawn and Burton Harrison was appointed his successor, to carry out a policy of liberalization and preparation for independence. The Filipinos were allowed to hold a majority of the seats in the commission, which became a kind of administrative upper house. Filipinos were substituted for Americans in many of the civil offices The people were thus given a definite opportunity to govern themselves. The Jones bill, enacted Aug. 29, 1916, greatly enlarged the power of the popular part of the government, and the commission ceased to exist. The act promised that the Filipinos should be given their independence when their ability to govern themselves should be demonstrated.

At the other end of the American sphere of influence, Cuba, while nominally independent, remained a protectorate of the United States. On March 2, 1917, the Puerto Ricans were for the first time made American citizens and received a popular government of two elected houses. President Wilson continued the administration of the Dominican republic which dated back to Roosevelt. He also took military control of Haiti in 1914, and followed it by a controlling treaty which was ratified by the senate (Feb. 28, 1916) He carried even farther Taft's policy in Nicaragua by a treaty (ratified Feb. 18, 1916) which converted that country into a virtual protectorate. Another area came under control of the United States by a treaty for the annexation of the Danish West Indies proclaimed in 1917. These islands were duly organized under the title Virgin Islands of the United States. Little opposition was made to this creation of a virtual empire, including dependent provinces.

Latin America and the Orient, 1913–17.—The peaceful policy of the United States toward its neighbours was severely tested by disturbances in Mexico In 1913, Francisco Madero, president of that republic, was murdered, presumably by order of V Huerta, an insurgent officer, who thereupon declared himself the head of the state The almost invariable policy of the United States had been to recognize any *de facto* head of a Latin-American government without inquiring into the source of his title But on this occasion President Wilson adopted what he called a policy of "watchful waiting" He steadily refused to recognize Huerta, against rival revolutionists. In April 1914 a trifling dispute arose at Tampico as to a salute of the U S flag and Wilson, apparently yielding to strong public sentiment, ordered the navy to attack and capture Veracruz, of which the United States remained in possession for several months The real object was to discredit Huerta, who was compelled to flee the country. When in 1916 the brigand Francisco Villa raided Columbus, N M., the president ordered a military expedition under Gen. John J. Pershing to advance into the interior of Mexico It remained about eight months, without capturing Villa or accomplishing any other definite result The three friendly nations of South America—Argentina, Brazil and Chile, commonly known as the "ABC powers"—offered a kind of mediation At their suggestion V. Carranza was recognized as president by the United States Disorder continued, and in May 1920 Carranza was overthrown and killed by the troops of A. Obregon For a time thereafter Mexico emerged from the state of revolution.

This long controversy was highly disturbing to the desired close relations with Lain America in general. In spite of four Pan-American congresses and several scientific congresses, in spite of visits of Roosevelt and of Root and Philander Chase Knox as secretaries of state to South America, there could be no harmony if the United States were to continue "administering" small and defenseless Latin-American nations and waging undeclared wars with Mexico. Nevertheless, President Wilson in a speech at Mobile, Ala., (Oct. 27, 1913) declared that the United States had no designs on the territory or independence of its Latin-American neighbours. Colombia, too, had a grievance arising out of the loss of the isthmus when the Panama canal zone was annexed in 1904. A treaty negotiated by Bryan to pay to Colombia $25,000,000 as a kind of reparation was ratified by the Republican administration in 1921

In regard to the far east, Wilson had little opportunity to develop a policy He began by disavowing the plans made under the advice of President Taft for a loan by U.S. bankers to China. He argued with the people of California because they insisted on passing a statute restricting alien ownership of lands by Japanese residents World War I soon united the United States and Japan in a common cause, and on Nov. 2, 1917, the Lansing-Ishii note, on the same plan as the Root-Takahira note of 1908, set forth that the United States recognized Japan's "special interests in China."

Neutrality.—The United States in 1914 expected to remain indefinitely at peace, as was shown by lack of anything that could be considered national military preparation in the terms of modern warfare. When on Aug. 4, 1914, President Wilson issued a proclamation of neutrality as between the two groups of European nations just engaging in a gigantic struggle, the authorized military establishment was about 107,000 men, of whom about 87,000 were enrolled The United States had not one military aeroplane of approved type; had only four modern heavy field guns and no transport for them; had not a trench bomb or a mine thrower; nor considerable supplies of any weapons or equipment except 800,000 excellent rifles; nor any officers experienced in the kind of warfare used in late wars; nor any instruction camps for officers or men. The navy included a fleet of battleships recently built, but weak in small and swift vessels and particularly in submarines. The militia proved to be of little service, though Secretary Bryan publicly declared that the nation needed no preparation, for it "could raise a million men between sunrise and sunset."

Neither the foreign policy nor the diplomatic organization of the United States was fitted for such a crisis The traditional Monroe Doctrine was expected to keep the nation out of dan-

gerous controversies with the other American states The counterpart principle of isolation forbade the United States to take any part in European crises or wars As a neutral it stood by the principle of "freedom of the seas," by which was meant in particular the right to carry on commerce with all belligerents in case of war, subject to the limitations of the then acknowledged international law as to contraband and blockade Soon after the beginning of World War I relief was organized on a large scale for the Belgian people, most of whose country was overrun and held by the Germans. This system soon included French refugees, the unhappy peoples of Serbia and Asia Minor and other combatant or noncombatant sufferers, besides the sick and wounded of the contending armies.

Difficulties with the Belligerents, 1914–17.—The United States was compelled at once to take into account the relation between the war and U S industries, commerce and finance Heavy loans were placed in the United States by Great Britain, France and Russia As fast as the money was borrowed it was spent in the United States for the purchase of food, clothing, animals and especially munitions President Wilson issued a proclamation (Aug 18, 1914) advising that the people remain neutral "not only in act but in word and in thought." Such neutrality was impossible In the first weeks of the war, German commerce was driven from the seas. The command of the sea by the Allies very nearly cut off trade of any kind between the United States and Germany and Austria, while commerce continued in ever-increasing volume with England and France. This disparity led to protests on the part of the German government, and also to lawless acts perpetrated or directed by agents dispatched by the German government for the purpose of paralyzing the munition factories. Violent antipathies were caused by the German methods of carrying on war, and particularly the treatment of the occupied areas of Belgium and France. The American population included hundreds of thousands of citizens of the belligerent countries, many of whom attempted to return to their homes in order to serve in the army. The road for such recruits was blocked for the Germans and their allies, but open to the Allies. For the first time in half a century the United States found within its own borders a sharp division on questions of foreign policy.

On the other hand, the war trade brought immense profits The favourable balance of trade rose from $690,000,000 in 1913 to $1,770,000,000 in 1915 and $3,000,000,000 in 1916. This prodigious debit was balanced by about $3,000,000,000 sent to the United States in securities and gold, besides $2,000,000,000 in foreign war bonds. Under these circumstances genuine neutrality was out of the question. A decided preponderance of sympathy developed toward the western Allies, who were profitable customers, were in close and almost undisturbed intercourse with the United States and were considered to be fighting against a ruthless, arrogant and dangerous autocracy.

International Controversies, 1914–17.—The internal tension of the United States was tightened by the insistence of Germany on the right to use new weapons, tactics and practices of war, without the traditional limitations of international law, without mercy to noncombatants, on the basis of "a law of necessity." No able-bodied German man or woman was really a noncombatant; the Germans insisted that they must regard all civilian enemies as combatants. There was no way to stop them without using similar new methods of warfare.

Great Britain, which in the London Maritime conference of 1908–09 had shown some disposition to enlarge the privileges of neutral commerce, now seized U.S. ships and shipments, and arbitrarily extended the list of contraband, until (Dec. 26, 1914) a dispatch signed by Secretary Bryan, but expressing the conclusions of President Wilson, made a protest In the course of 1915 the British government began to apply the U.S. principle of "continuous voyage" as applied by the United States during the Civil War to cover shipments to neutral ports in cases where those shipments were likely ultimately to reach Germany; and also where they might replace products of the neutral countries that could thus be spared for Germany; or if the neutral countries declined to make a hard and fast agreement not to reship.

In 1916 the British were practically blockading neutral European ports and capturing vessels, U.S. and other, wherever they liked The Central Powers set up a new war practice of using submarines as commerce destroyers. The U S government protested. A crisis came through the sinking by a submarine of the British passenger liner "Lusitania" (May 7, 1915), with the loss of 139 American lives. That sinking seemed a deliberate act of the Germans to test the temper of the United States Apparently they were greatly surprised when the people of the United States rose in resentment. President Wilson, who had earlier insisted on "strict accountability," insisted on a sharp protest Bryan thought milder measures sufficient, and on that issue resigned the secretaryship of state (June 8, 1915), being succeeded by Robert M. Lansing The correspondence went on until October when Germany at last informed the U.S. government that merchant ships would not be sunk without warning and an opportunity to save noncombatant lives Meanwhile, throughout 1915 and 1916, systematic violations of the neutrality laws of the United States by Germans and Austrians caused the dismissal of the Austrian ambassador to the United States and of the two most obnoxious members of the German ambassador's staff.

"Preparedness."—By the end of 1915 it became clear that with or without their own desire, the people of the United States might find themselves involved in the war President Wilson desired peace. A day or two after the sinking of the "Lusitania" he spoke of there being such a thing as "a nation that was too proud to fight." In his message of Dec. 1915 he urged national defense and the protection of American shipping. Long before this time World War I had brought about a violent change in the economic conditions of the country. The great demand for foodstuffs raised the price of grain and other farm products. The high cost of living became a political issue. The munition factories offered unheard-of wages and drew hundreds of thousands into improvised towns. The war caused a great change in immigration. Hundreds of thousands of men left the United States for Europe, while the net immigration fell from 1,200,000 in 1914 to 300,000 in 1916.

The Election of 1916.—In the midst of this turmoil and confusion of business came the preliminaries of the presidential election of 1916. President Wilson carefully abstained from taking sides between the Allies and the Central Powers; but the aggressive submarine policy of Germany provoked a much sharper tone than did the aggressions by the English. He felt the need of caution, particularly because a growing group of men, among them Roosevelt, were coming to the conclusion that eventually the United States would have to join in the war.

The Republican nominating convention met in Chicago, June 7. A strong effort was made by friends of Roosevelt to capture the Republican convention, but the standpat Republicans had control of the party machinery. The Progressives—who in Nov. 1914 had cast 1,800,000 votes for congressional and state candidates—also met in convention in Chicago. Their purpose was to compel the Republicans to nominate Roosevelt as the only means of healing the breach. That effort failed· the Republicans nominated Justice Charles E. Hughes of the supreme court, who had been a reform governor of New York state. The days of the Progressive party seemed numbered.

In the Democratic convention (June 14) there was practically no opposition to Wilson and his running mate T. R. Marshall. The platform in many respects was similar to that of the Republicans. Both favoured woman suffrage, the conservation of national resources and national enforcement of child-labour laws; both reaffirmed the Monroe Doctrine, But the Democrats upheld tariff for revenue only; they endorsed the promise of ultimate independence to the Filipinos; they commended the establishment of a federal trade commission; and they approved a merchant marine owned and operated by the federal government. In the campaign Roosevelt publicly supported Hughes, though it was well-known that he felt no enthusiasm for him. The only slogan that caught the public ear was favourable to Wilson: "He kept us out of war." Wilson received about 9,000,000 popular

votes against 8,500,000 for Hughes, and was chosen by a close vote in the electoral college

ENTRY INTO WORLD WAR I

President Wilson stood in a strong position in the United States and in the world He had been re-elected. His policy was approved He felt that he had the nation politically united behind him. He hoped that the one great neutral nation might bring about peace On Dec 18, 1916, he sent a communication to the warring powers suggesting that they come to an understanding of each other's demands. On Jan 22, 1917, in an address to the senate on foreign affairs, the president described the replies he had received to the identic note of Dec 18.

The Central Powers united in a reply which stated merely that they were ready to meet their antagonists in conference to discuss terms of peace The Entente Powers have replied much more definitely, and have stated, in general terms indeed, but with sufficient definiteness to imply details, the arrangements, guarantees and acts of reparation which they deem to be indispensable conditions of a satisfactory settlement

He went on to speak of an "organized common peace," and of a "peace without victory"; he outlined the principle of self-determination, declaring that "Governments derive all their just powers from the consent of the governed," and that "no right anywhere exists to hand people about from potentate to potentate as if they were property." The German answer was a brief note communicated by Ambassador Count von Bernstorff to Secretary Lansing (Jan. 31, 1917), withdrawing the pledge given in Oct 1915 and renewed in May 1916 that merchant ships would not be sunk without preliminary warning and announcing that the Germans would shortly resume unrestricted submarine warfare. High military authority in Germany believed that Americans would never sacrifice the large profits of export trade and incur the huge expenses of war merely for the sake of a question of neutral maritime rights.

Immediate steps were taken to make the U.S. navy ready for war. For a time the president dallied with a plan of arming merchant ships One result of the controversy was the adoption by the senate (March 8) of a mild and cumbrous method of cutting short debate by closure. During Feb. and March 1917 a few U.S. vessels were torpedoed by German submarines. On March 1 the government published an intercepted German dispatch to the Mexican government asking it to join in the war, promising it the "former Mexican provinces," long incorporated in the United States The participation of the United States in the war was now inevitable A formal declaration of a state of war was signed by the president (April 6) after a house vote of 373 to 50 and a senate vote of 82 to 6, which stated that war had already been begun by Germany. Relations with Austria and Turkey were at once broken off, but the declaration of war with Austria was delayed until Dec. 7 and no declaration was ever made against Turkey or Bulgaria.

The breach with Germany was a spontaneous national action representing a national belief that the United States could no longer live in peace with such a nation as Germany had become. As President Wilson put it the war was to make the world "safe for democracy." Moreover, there was widespread sympathy with the three western powers, France, Belgium and Great Britain, which were closest to the United States in their political principles and system of government. Wrath was aroused by the German treatment of the people of Belgium and other conquered countries In some minds there existed a genuine and well-grounded fear of a future attack upon the United States by Germany if the resistance of the Allies should be destroyed. Amid all the motives for the war, the one thing was that the American people recognized Germany as an enemy, and the enemies of Germany as natural friends and partners in the great enterprise of subduing "the Hun."

War Measures.—Passionate national spirit, patriotism and urgent reasons for war were all useless unless the United States could enrol, train, equip, convey and continuously supply an immense army. The U.S. navy, though the vessels were good and the crews skilled and well commanded, was in no position to give direct aid in the process of destroying the German army What was most needed was to raise and convey to the fighting front a large force of U S. troops.

Soon after the declaration of war by the United States, missions from the various Allied countries were sent to America. The British mission, headed by Arthur (later Lord) Balfour, British foreign secretary, reached Halifax April 20 and proceeded to Washington The French mission, headed by René Viviani, the former premier, and including Marshal Joseph Joffre, landed April 24. Other missions came from Italy, Belgium, Russia, Rumania and Japan. The United States was able at once to help the western Allies in their pressing financial difficulties. Taxes were low and little felt, money abounded Under acts of congress beginning Oct. 17, 1917, the Allies received essential credits, which amounted eventually to $9,500,000,000.

These enormous payments were made possible by the Liberty Loans. In June 1917, 4,000,000 people joined in offering $3,000,000,000 to the government; and at the end of World War I the interest-bearing debt had increased from $972,469,290 on Dec. 31, 1916, to $25,234,496,174, on June 30, 1919 These loans were supplemented by the War Revenue act (Oct 17, 1917) and later statutes, which laid a variety of new taxes, increased the income tax heavily and combined with it an excess-profits tax to bring into the treasury unreasonable profits likely to be made in the war industries

All traditional limitations on raising an army were discarded On May 18 the Selective Service act was passed which provided for the enlistment of 1,000,000 men by "selective draft." When called up, the men had to be clothed, housed, fed and drilled Thousands of officers were necessary, and training camps, both for men and officers, were established on a vast scale In May 1917 a few U.S. destroyers reached England On June 9 General Pershing, who had been selected as commander in chief, arrived in England. On June 26 a small detachment of United States troops reached Europe New branches of military service were established, among them the chemical warfare service which provided materials for lethal gases and for gas masks and other means of resisting the enemy attacks Congress, on July 24, appropriated $640,000,000 for aviation By August about 700,000 men were enrolled in the army and 230,000 in the navy

Control of Industry and Transportation.—The establishment of huge war industries put a great strain on the industry and transportation of the United States On Aug 10, 1917, a Food Control act gave the president powers never before conferred with regard to food and fuel Herbert C Hoover of California, who had distinguished himself in the management of the Red Cross in Europe, was made food administrator with large powers. Before World War I ended he had established "meatless" and "wheatless" days; the price of grain was fixed; eventually the farmers were assured $2.20 a bushel for their wheat crops H. A. Garfield, fuel administrator, carried through drastic measures for stimulating the production of fuel, regulating shipments and distributing supplies. On March 21, 1918, the Federal Control act placed the management of all the railways in the country in the hands of the government during World War I, and for a period after its close W. G. McAdoo, secretary of the treasury, was made director-general of the railways; later Walker D. Hines, an experienced railway man, succeeded him. One of the most serious needs of the times was a merchant fleet adequate to carry across the Atlantic the army and its supplies. The government undertook the great task of improvising such a fleet, and vast construction was authorized in both steel and wood.

War Activities at Home.—At once after the declaration of war the American people through official and unofficial channels gave support by civilian service and money contribution. Among the multifarious public agencies was a committee on public information, of which George Creel, journalist, was chairman, which kept up a lively system of publicity aided by the National Board for Historical Service. A censorship board censored all communications—mail, cable, radio—passing between the United States and foreign countries As early as Aug. 29, 1916, the Council of National Defense was created by act of congress Under it were

created numerous special organizations The Council of National Defense appointed a women's committee to co-ordinate the patriotic work of the women throughout the country The advisory commission of the Council of National Defense created a committee on transportation and communication A railroad war board undertook to secure unity of operation among all the railways, to subordinate private interests and to eliminate competition Important coastwise steamship lines were added to this system In 1918 the government assumed control of telegraph, telephone, marine cable systems and radios Many scientists were engaged in research throughout the country under the National Research council Commerce also was regulated.

By the Espionage act of June 15, 1917, the president was empowered to control exports, and he created a bureau of export licences and a trade board A list was prepared of firms throughout the world with whom Americans should not trade The government formally took charge of all foreign trade Feb. 15, 1918, and seized all German ships interned in United States ports.

Samuel Gompers, president of the American Federation of Labor, co-operated in organizing a committee on labour, and a mediation commission was appointed The National War Labor board (April 9, 1918) acted throughout the country as a kind of "supreme court" to settle labour disputes. For the recruiting of essential labour and directing it into necessary industries a U S. employment service was created.

Several private war agencies were established. Chief among these were the American National Red Cross, which was to be found wherever there was fighting, sickness, suffering or starvation, the Y M C A ; Y W.C.A ; Knights of Columbus (Catholic); Salvation Army; Jewish Welfare board; American Library association; and War Camp Community Service.

Enemies in the United States.—While the people of the United States were practically a unit in favour of a vigorous prosecution of World War I, a few, chiefly foreign-born or sons of foreign-born, were opposed to the war or more often to the nations in concert with which the United States was fighting Ever since 1914 the country had been irritated and aroused by a series of illegal, violent and often murderous acts which were traced to German and Austrian agents. Such were determined efforts to blow up the international bridge at Vanceboro, Me., and the locks of the Welland canal, Ont. Bopp, German consul general at San Francisco, Calif , was convicted and imprisoned for aiding German vessels in the Pacific in defiance of neutrality laws. Franz von Rintelen (after the war specially rewarded by the German government) was sent to the federal prison at Atlanta, Ga , for aiding in placing bombs on outgoing vessels with intent to destroy them.

The Navy.—Beginning with patrol work on the American coast as soon as war was declared, the activities of the United States navy extended to co-operation with the British and French in the hunting down of submarines and the protection of convoys and in the laying of the North sea mine barrage, extending from the Orkneys to Norway The U S navy had some part in blockading the Austrian coast of the Adriatic, and it participated in maintaining that Allied command of the sea which in the end was fatal to Germany. By a remarkable convoy system more than 2,000,000 troops were carried safely 3,000 mi. overseas to France. In this work the utmost secrecy was necessary. In June 1917 a few cruisers and transports were provided and the first troops sent across At intervals vessels assembled and sailed on definite routes under the protection of destroyers According to the report of the secretary of the navy (1920), 911,047, or nearly half of the U S. troops, were carried on United States navy transports; the rest chiefly by the British. Not one eastbound U S. transport was torpedoed by the German submarines; and only three ships were sunk on their return voyage. Three small fighting ships were destroyed by the enemy.

During the campaign of 1918 efforts were made to extend the possible field of enlistment by the passage of the Man Power act of Aug. 27. All men between 18 and 45 were required to register with a view to service if needed, and 11,000,000 were registered. By a statute of Oct. 6, 1917, provision was made for a system of military and naval insurance available for all men in the service (A. B. H ; X)

The American Expeditionary Force.—When Gen. John J. Pershing, commander in chief of the American expeditionary force, departed for Europe on May 28, 1917, America's military defensive forces comprised a regular army of approximately 80,000 and a national guard of less than 150,000. While the regular army was well officered and trained as regimental units, the national guard was not adequately organized nor sufficiently trained Industry was not prepared for its part and no authority for raising national armies had been enacted. Consequently, the nation found itself faced with the problems involved in providing manpower and organizing, financing, equipping and transporting overseas an enormous army and organizing a theatre of operations—all before Germany could strike decisively on the western front With her small unprepared forces as a nucleus, the United States called into army service 4,000,000 men, sent overseas 2,086,000 in 19 months, averaging in the summer of 1918 about 10,000 men per day. The first contingent comprised the regular army 1st division and some special troops which landed in France at the end of June 1917. The peak of the troop shipment was reached in the summer of 1918, when more than 300,000 men landed in one month. More than 50% of the U S. forces were carried in Allied ships In addition about 7,500,000 tons of supplies were shipped from America to France, practically all in U.S ships. The tasks involved in these problems were both intricate and gigantic.

Upon America's entry into World War I, German hopes of final victory cannot be said to have been extravagant The Allies were embarrassed financially and through lack of supplies Losses had been tremendous and resources in manpower were so low that there was little prospect of materially increasing their armed strength even in the face of the probable concentration on the western front of practically the whole German military strength in the spring of 1918. A review of the conditions then existing made so apparent the early necessity for a supreme effort that General Pershing cabled Washington on July 6, 1917: "Plans should contemplate sending over at least 1,000,000 men by next May " Upon completion of his study on July 11, 1917, he reported· "Plans for the future should be based . . . on at least 3,000,000 men." By the middle of Oct. 1917, General Pershing had completed his basic plans for the operation of the U.S. army in Europe These included the training of the combat army, the organization of supply in Europe, a priority for shipment from the U.S. of troops and supplies, and a project for the army's strategical and tactical employment.

The U S. mission was offensive. The plans were based on striking where a definite military decision could be gained. While the Allied armies had endeavoured to maintain the offensive, the British, in order to guard the channel ports, were committed to operations in Flanders and the French to the front protecting Paris. Both lacked troops to operate elsewhere on a large scale A deep advance east of Metz, or the capture of the Briey region, by threatening the invasion of rich German territory in the Moselle valley and the Saar basin; and curtailing her supply of coal or iron, would have a decisive effect in forcing a withdrawal of German troops from northern France The military and economic situation of the enemy and the Allies indicated Lorraine as the field promising most fruitful results and in Sept. 1917 it was selected by General Pershing as the area for the decisive operations of the U.S. army. These plans contemplated a reduction of the St. Mihiel salient followed by a decisive blow based either on Verdun or on Nancy. The organization of the immense U.S. supply service accorded with this strategical conception. The complexity of trench life had enormously increased the tonnage of supplies required by troops. Not only was it a question of providing food but enormous quantities of munitions and material. Upon the railroads of France fell the burden of meeting the heavy demands of the 3,500,000 Allied combatants. If the U.S. army was to have an independent and flexible system it could not use the lines behind the British-Belgium front nor those in the rear of the French front covering Paris, for these were needed for the

British and French forces respectively The problem confronting the American expeditionary forces was then to superimpose its rail communications on those of France where there would be the least possible disturbance to the existing arteries of supply These controlling factors led to the organization of base ports along the southwest coast of France and the utilization of French railways passing mainly south of Paris

For all practical purposes the American expeditionary forces were based on the American continent. Three thousand miles of ocean to cross with a growing submarine menace, an uncertain quantity of ship tonnage available and a land line of communications in France 400 mi. long, presented almost insurmountable difficulties. The system developed in France included U.S construction of 83 new ship berths, about 1,500 mi. of new railway with shops and roundhouses, 4,000 km of telegraph and telephone lines with the operation of a 215,500-km. system; 1,500 locomotives and 20,000 freight cars brought over and U.S. engineers repaired 2,000 French locomotives and 58,000 French freight cars Daily tonnage at ports increased from 17,000 in July to 45,000 in Nov. 1918. Commanded by Maj. Gen James G. Harbord, this great supply system engaged more than 650,000 personnel by Nov. 11, 1918.

The problems indicated were complicated by those necessarily involved in the association of the U S commander with Allied governments and commanders. The outstanding problems related to the persistent Allied proposals for the amalgamation of the Americans in the British and French ranks. This General Pershing consistently and successfully opposed; he favoured unity of U.S. command; adherence to the American doctrine of open warfare training and the primary value of the rifle and bayonet.

In meeting the crises caused by the German offensives in the spring and summer of 1918, U.S. troops (combat and service) were frequently employed with decisive results under Allied command. The 1st division's successful Cantigny operation near Montdidier, in May, demonstrated American fighting qualities. The 2nd and 3rd divisions in June blocked the German advance on Paris by holding the line about Château Thierry. The 3rd and 42nd divisions held a vital part of the line against the German attack of July 15. The successful Allied counteroffensive of July 18 was based on the decisive blow delivered south of Soissons by the 1st and 2nd U.S. divisions with the 1st French Moroccan division between them. Thus the U S arms were in time to assist in crushing the last offensive of the enemy and to commit him entirely to the defensive.

After these divisions cut the main German communications in the Marne salient, the 3rd, 4th, 26th, 28th, 32nd, 42nd and 77th U.S divisions joined the French in driving the enemy out of the salient and across the Vesle river. At the same time some divisions were holding sectors in the Vosges and others were training as reserves behind the British and even participating in British operations. About 20,000 aviation specialists were working in England and more than 11,000 motor mechanics were helping the French in addition to several thousand engineers, medical, hospital and other specialists.

The successful counteroffensive of July 18 against the Marne salient showed that the emergency which justified the dispersion of U.S. divisions had passed. By July 24 Marshal Ferdinand Foch accepted General Pershing's proposal for the organization and operation of an independent U.S. combat army and the execution of the U.S. plan of the previous September. Accordingly, early in the morning of Sept. 12 the U.S. 1st army, 550,000 strong, supported by 110,000 French troops, attacked the St. Mihiel salient and within a few hours had attained its objectives. Following out a prearranged plan the Americans were immediately transferred to the Meuse-Argonne zone where they began operations on Sept. 26. In the fighting which followed the Americans (24 U.S. and 7 French divisions) drove the Germans from their strongly fortified positions and captured the heights commanding Sedan; only the Armistice saved the 5th German army from complete destruction. The Germans had employed one-fourth of their divisional strength (62 divisions) to meet the attack. (For full particulars of these two battles *see* ST. MIHIEL· MEUSE-ARGONNE OPERATION.)

During these purely American battles, other U.S. troops and services continued to operate under Allied command, such as the troops of two divisions who assisted the British to break the Hindenburg line at Le Cateau in Sept 30–Oct. 1; the two divisions with the 4th French army capturing Mont Blanc and advancing toward the Aisne in early October; two divisions with the 6th French army in Flanders in late October and early November driving the enemy across the Escaut and the Scheldt rivers. In addition, a regiment of infantry with auxiliaries assisted the Italians on the Piave in the fall of 1918 and another regiment and auxiliaries joined the Allies in the Russian Archangel expedition of 1918–19.

Thirteen major operations in which Americans participated:

Operations	Approximate number of Americans engaged
West front—campaign of 1917.	
Cambrai, Nov. 20–Dec 4	Detachments
West front—campaign of 1918:	
German offensives, Mar. 21–July 18:	
Somme, Mar 21–Apr. 6	2,200
Lys, Apr 9–27	500
Aisne, May 27–June 5	27,500
Noyon-Montdidier, June 9–15	27,000
Champagne-Marne, July 15–18.	85,000
Allied offensives, July 18–Nov. 11:	
Aisne-Marne, July 18–Aug. 6	270,000
Somme, Aug 8–Nov. 11	54,000
Oise-Aisne, Aug 18–Nov. 11	85,000
Ypres-Lys, Aug 19–Nov 11	108,000
St Mihiel, Sept. 12–16	550,000
Meuse-Argonne—Sept. 20–Nov. 11	1,200,000
Italian front—campaign of 1918:	
Vittorio-Veneto, Oct. 24–Nov. 4	1,200

The Armistice.—The campaign of 1918 was the final effort of the Germans. No one can say that the U.S. army in the field was the chief element that ensured victory; but there is not a doubt that the triumphant success in raising and transporting incessantly troops, provisions and supplies was to the German mind convincing and disheartening evidence that the government and the people of the United States, with all their power and potentiality, would stand by the Allies indefinitely. On Nov. 11, 1918, by the Armistice in which the U S. armies shared, the Germans admitted their defeat and at once began to evacuate the occupied regions and also portions of their own national territory.

In accordance with the terms of the Armistice, the Allies were to occupy all German territory west of the Rhine. The zone assigned the U.S. command was the bridgehead of Coblenz and the district of Trèves. This territory was occupied by the U S army with its reserves held between the Moselle-Meuse rivers and the Luxembourg frontier. The advance toward German territory began on Nov. 17, 1918, and passing through Luxembourg crossed the German line on Dec. 1.

Shortly after the signing of the Armistice, the U.S. commander formulated plans for the early return of the U.S. forces to America. Rearrangement of base port and rail facilities, securing additional ships and the demands of the Allies for considerable U.S. forces to remain in France, necessarily presented important considerations. Beginning, however, in December, a continuous flow of returning troops was maintained and by May 19, 1919, all combat divisions, except five still in the army of occupation, were scheduled to sail by July. The remaining troops, less a permanent force of one regiment of infantry and certain auxiliaries, were released in Aug. 1919. (J. P.)

AFTER WORLD WAR I—TO 1926

Rehabilitation, 1919.—The task of *post bellum* economic adjustment was long and costly. At the end of the war the federal government by means of war statutes was attempting to control the distribution of food, was in fact limiting and rationing manufactured goods and was continuing to direct mining of

coal and its shipment. The government was directing the operation of railways, and the telegraph and telephone services. It had taken over the property of aliens through an alien property custodian. For foreign commerce there was still the Shipping board, the Emergency Fleet corporation, the War Trade board and the War Finance board. Two million U S. soldiers were overseas and wanted to come home as soon as possible The United States had spent on the war about $35,500,000,000, including $9,500,000,000 lent to the Allies. Expenditures after peace came continued on a scale far beyond any previous experience of the country.

In the course of six months after the Armistice, about two-thirds of the troops were brought back, leaving behind them enormous stores, large parts of which were sold at heavy discounts to European governments. On June 1, 1920, the only U S. troops left in Europe were an army of occupation in western Germany.

The Election of 1918.—The Armistice had come a few days after the state and congressional elections of the autumn of 1918 Despite the deep political and sectional divisions in both the Republican and Democratic parties that had preceded the declaration of war in 1917, the nation had been a unit in waging war. Partisan politics did not enter into the organization of the armed forces. Little attention was paid to politics in the civilian administration of the war. Yet the administration of the president was subject to constant attack by prominent Republicans and by Republican members of congress, and in Jan. 1918 the Republican national committee began a campaign to capture control of congress in the autumn elections.

A few days before the elections, President Wilson issued a circular letter urging the voters to return a Democratic majority to the senate and the house. The result of the election, however, made the new house decidedly Republican and the senate Republican by two votes. It was apparent, therefore, that the administration in making the necessary adjustments after the war had to take into account the preponderant opposition in both houses of congress.

Throughout 1918 the influence of Theodore Roosevelt in the Republican organization was manifestly growing It became clear that he would wield great influence in the Republican convention of 1920 and might be chosen as candidate of the party, despite his defection in 1912. But he died suddenly on Jan. 6, 1919

The Peace Conference.—In Dec 1918 President Wilson decided that he would attend the forthcoming peace conference in person, and designated as peace commissioners Secretary of State Lansing, Col. Edward M. House of Texas (his most intimate friend and political adviser), Gen Tasker Bliss of the army and Harry White, formerly minister to France. Wilson was one of the representatives of the four great powers—Great Britain, France, Italy and the United States—who prepared the articles of the treaty of peace.

A part of the treaty was the covenant of the League of Nations, a crystallization of long-debated suggestions for a world confederation of states President Wilson was deeply interested in the foundation of such a league as was envisioned in the covenant, and was willing to agree to a suggestion of the French for a treaty of mutual protection in order to gain the support of the French for the proposed covenant.

U.S. Action on the Treaty, 1919.—It had been apparent during the course of the negotiation of the treaty that in the U S. congress and electorate there would be vigorous debate on the covenant of the League and, indeed, upon the question of U.S. membership in such a league. President Wilson returned home for a short stay (Feb. 24–March 4), defending the general terms of the treaty and the covenant. On June 28, 1919, he and his four commissioners signed for the United States the formal treaty of Versailles, including the covenant of the League, which was so interwoven into the text of the treaty that it was impossible to ratify one without the other. The treaty had many powerful supporters among all parties, particularly former President Taft, the League of Free Nations association and the League to Enforce Peace. The senate was divided into strongly opposed groups. Most of the Democrats, under the lead of Sen. Gilbert Hitchcock (Neb.), followed the president in favouring the treaty with the covenant as it stood. A group of Republicans, headed by Sen. Henry Cabot Lodge of Massachusetts, favoured "amendments" to the treaty and "reservations" to the League. Another group desired reservations that would practically destroy both. A small group, including Sen William Borah of Idaho and Sen. Hiram Johnson of California, were against both the treaty and the covenant in any form or with any reservations.

The contest ostensibly centred about article x of the covenant, under which the members of the League undertook "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." The implacable group expressed fear lest the United States be drawn into foreign wars and insisted that "no American soldiers or sailors must be sent to fight in other lands at the bidding of the League of Nations." The president, on the other hand, regarded article x as the heart of the whole treaty. He declined at the critical moment to accept either amendments or reservations, except certain minor alterations After strenuous debate and by a test vote, Nov. 19, 1919, the senate refused to ratify the peace treaty with reservations—the vote being 53 to 38 in favour, but not the necessary two-thirds. In the regular session upon resubmission, the vote was 49 to 35, again not the necessary two-thirds Thus after five months' discussion the treaty was rejected, and the United States was left in the situation of remaining technically at war with Germany and Austria though all hostilities had ceased a year before.

President Wilson, believing that he could arouse public sentiment to force senate ratification, had undertaken a tour of the country in September. He was greeted by great audiences, but the response of the country was not convincing Not only did senate opponents speak before great audiences in rebuttal, but it was apparent in public discussion that many elements in the population were pledged to U.S. "isolation" from Europe.

The president's tour was abruptly ended when he collapsed, in Colorado, and a paralytic stroke in October removed him for months from active participation in work of the government.

On March 4, 1921, Wilson accompanied President-elect Warren G. Harding to the capitol as the last act of his official life. Wilson had been president for eight years, during six of which he was the undisputed leader of his party. He was responsible for important revenue, banking and labour laws. He had a great hold on millions of citizens. For a time in Paris he was the foremost man in the world, and he succeeded in inducing foreign statesmen to accept the League of Nations At the height of his career he lost the prestige gained as war president of the whole country, was no longer fully accepted by his party and ceased to be the one man who could appeal from congress to the people. He lived in Washington in retirement, physically unable to take part in public affairs, and died Feb. 3, 1924.

Presidential Election of 1920.—The peace revealed underlying elements of dissatisfaction The soldiers received in many states a money bonus and an organized lobby demanded a bonus from congress The general public complained bitterly against the rising cost of living A multitude saw their incomes and expectations reduced by the fall in the purchasing power of the dollar As the presidential election opened, the Democratic party was paralyzed by internal dissensions over the peace treaty and by lack of leadership of the president; it had no accepted policy in foreign relations or reconstruction and no commanding figure to put forward for the presidency.

The Republicans were rent by personal rivalries. Gen. Leonard Wood, Gov. Frank Lowden of Illinois and Sen. Hiram Johnson of California were outstanding candidates. The convention at Chicago (June 9, 1920) passed them all by, and gave the nomination to Sen. Warren G. Harding of Ohio. He was backed by a strong group of standpatters. Calvin Coolidge, governor of Massachusetts, was put on the ticket as vice-president The Democratic convention held at San Francisco was confronted with similar difficulties The nomination went to Gov. James Cox of Ohio, a man little known in national affairs, with Franklin D. Roosevelt

of New York, who had served as assistant secretary of the navy, as candidate for the vice-presidency In the campaign for the first time women were eligible to vote in every state. The election was a complete triumph for the Republicans, who elected Harding by a popular majority of about 7,000,000, and an electoral majority of 404 against 127 for Cox, besides securing solid majorities in both houses of congress.

The presidency was thus transferred to a man little experienced in national politics, whose task it was to take over the discordant elements and build out of them a coherent policy. President Harding began his administration under favourable auspices, although several members of his cabinet had been chosen in the face of strong opposition from various quarters. The new president displayed keen interest in all attempts to restore business to a sound basis and urged prompt action in the assistance of the railways. By nature conservative, he laboured to bring the country back to a state of "normalcy."

Harding's foreign policy was to remain outside the League of Nations. Special treaties of peace negotiated with Germany, Austria and Hungary were ratified by the U.S senate Oct 18, 1921. Of world-wide importance was his call for a conference at Washington of the different powers bordering on and interested in the Pacific ocean, to discuss both questions of the Pacific and the limitation of armaments. The conference assembled Nov. 12, 1921, and closed Feb. 6, 1922. The nine participants were the United States, Great Britain, France, Italy, The Netherlands, Belgium, Portugal, China and Japan Important agreements were signed; to limit construction of capital warships, against improper use of submarines; against gas warfare; for maintenance of the status of Pacific insular possessions; and other questions involving relations with Japan and China (*see* WASHINGTON CONFERENCE).

Before Harding came to the presidency, two constitutional amendments had crystallized some of the results of the war. The various prohibition measures passed by the congress led finally to passage and ratification of the 18th amendment The service of women in the war, together with the votes they already enjoyed, caused congress (June 7, 1919) to submit the 19th constitutional amendment annulling all restrictions of sex on suffrage. It received the ratification of the 36th state on Aug. 24, 1920, and went into force Aug. 26.

Political and Social Conditions, 1921–26.—A study of the political, social and economic history of the United States must take account of the extraordinary national elation following World War I. It produced a profound effect upon the national mind and was the beginning of an enlargement of national life in every direction. The nation felt free to expand its influence in the Caribbean and the Pacific. Hence the maintenance and enlargement of a policy of paramount interest in the three normally independent countries—Cuba, Haiti and the Dominican Republic, and a strengthening of the control over Panamá, Honduras and Nicaragua.

To carry out great national policies, the United States could call upon a population expanding from year to year. The total continental population rose from 92,000,000 in 1910 to 106,000,000 in 1920. Net immigration of 818,000 in 1910 sank to 19,000 in 1918, but rose in 1924 to 663,000. The wealth of the country, estimated at $187,000,000,000 in 1912 was counted at $321,000,000,000 in 1922, and was still swelling in volume Against these figures, such burdens as a national debt of $25,000,000,000, bearing $1,000,000,000 of annual interest, besides $6,000,000,000 of state and municipal debts were insignificant. Manufacturing, transportation, mining, distribution and financial business were all prosperous.

Political rancour and party spirit diminished during these years. President Harding drew several strong men into his cabinet in March 1921. Secretary of State Hughes had been a justice of the U.S. supreme court and candidate for the presidency in 1916 Secretary of the Treasury Andrew Mellon was a successful banker and financier who had never before appeared in public life. Herbert Hoover, secretary of commerce, contributed his extraordinary gift of business organization Henry C. Wallace, secretary of agriculture, was the editor of a great agricultural newspaper. President Harding's career was cut short by a very brief illness, however, and he died in San Francisco, Aug 2, 1923.

President Coolidge, now elevated from the vice-presidency, set up a new regime in the White House He proved to be a man of strong character, who consulted those whom he trusted and then made up his own mind and stood by his decisions Coolidge for the time being continued Harding's cabinet, but later changes were made, so that at the end of five years Secretary of the Treasury Mellon, Secretary of Commerce Hoover and Secretary of Labour James Davis were the only men left of Harding's first cabinet.

The growth in wealth and enterprise reacted upon the government where even the president's cabinet was disturbed and dismembered by a painful series of accusations and investigations For several years the government had conserved certain oil-bearing areas of public land as a supply of oil fuel for the navy. On April 7, 1922, jurisdiction over this matter was transferred from the navy department to the interior department by an order of President Harding Under this authority Secretary of the Interior Albert B. Fall leased to the Sinclair interest a large tract in the Teapot Dome district in Wyoming and also leased one of the California reserves to the oil magnate, Edward L. Doheny There was an investigation by a senate committee under the chairmanship of Sen. Thomas J. Walsh of Montana Secretary of the Navy E. Denby resigned and was replaced by Judge Curtis D Wilbur of California. Meanwhile Att. Gen Harry M. Daugherty came under attack. A special committee of the senate under Sen. B. K Wheeler of Montana unearthed questionable procedures and Daugherty refused to allow the files of his office to be examined by the senate committee President Coolidge demanded his resignation March 28, 1924. Criminal proceedings were instituted against Fall, Doheny and Daugherty, but legal technicalities were invoked by the defense and President Coolidge took a neutral attitude in these proceedings, which he considered to be outside the scope of the executive power. Daugherty was succeeded as attorney general by Harlan F. Stone of New York; then Stone was placed on the supreme court bench and John G. Sargent of Vermont became attorney general.

In the congressional elections of 1922 the Republicans had retained small working majorities in both house and senate There was, however, a return of earlier conditions in the appearance of a small group of independent Republicans, with Robert La Follette of Wisconsin as leader, who were able sometimes to hold the balance of power between the regular Republicans and Democrats President Coolidge's conduct during his eight months in office seemed to justify the confidence of his party; and when the Republican convention met in Cleveland there was little opposition to his nomination. The vice-presidency offered difficulties In the end the choice fell upon Charles G. Dawes, known through his association with the commission of 1923 which had devised a scheme for the payment of reparations by Germany The Democratic convention, held in New York city, was the longest and fiercest in 60 years. The vote was divided between William G. McAdoo, former secretary of the treasury, and Alfred E. Smith, who had won a national reputation as governor of New York.

The convention balloted 103 times; but neither candidate could secure the necessary two-thirds. The convention finally nominated John W. Davis of West Virginia, former ambassador to Great Britain, with Charles Bryan (brother of William J. Bryan) as vice-presidential candidate. The campaign was quiet; in the election (Nov. 1924) Coolidge received 15,725,016 votes, as against 8,386,503 for Davis and 4,822,856 for La Follette, who gathered up many discontented Republicans and the considerable vote usually cast for Socialist and other minor candidates. La Follette, however, had only the 13 electoral votes of his own state as against 136 for Davis and 382 for Coolidge. It was a substantial Republican victory, accompanied by a Republican majority over-all of 59 in the house and 16 in the senate. Vice-President Dawes on taking his seat in the senate for the first time (March 4, 1925) seized the occasion to suggest that the procedure of that body needed reform; and that its first duty was to pass

an efficient rule of closure.

Finance.—Throughout both his terms of presidential service Coolidge addressed himself to a policy of economy. He stood by the budget bill which President Harding had secured from an unwilling congress and continued the appointment of Gen. Herbert M. Lord as chief budget officer. This reform meant simply that congress would not begin to act on the main appropriation bills until a budget based upon the ascertained needs of all the various departments had been drawn up, totalled and submitted by the budget officials.

In 1913 the United States had adopted an income tax, made possible by the 16th amendment to the constitution. During World War I the tax was used to transfer some of the immense war profits to the public treasury. Thenceforward the income tax was the largest factor in the national revenue and was vigorously collected from individuals and corporations. The policy of the government was to break down the high scale of war expenditure, to dispense with superfluous employees and so to come back to the public needs in time of peace. Several acts of congress, begun in 1921, reduced the rate of income tax The result was that the amount paid in income taxes, which was $2,600,763,000 in 1919 and $3,056,936,000 in 1920, came down to $1,691,000,000 in 1923 but rose to $1,761,659,049 in 1925 By the act of Feb. 26, 1926, the rates were still further lowered but without any decrease in the total collected; and the provision in the statute of 1924, under which the amounts paid by individuals or corporations were open to the public, was repealed.

The Underwood tariff of 1913, passed by the Democrats and somewhat altered in 1916 and 1921, was repealed by a Republican majority after the inauguration of President Harding; and an emergency act was passed (May 27, 1921). Soon afterward the Republicans framed a new bill, the Fordney-McCumber tariff, signed by President Harding Sept. 21, 1922. It included a provision, never before a part of a United States statute, under which the President (informed by a tariff commission) was to have power to alter rates of duty if necessary to "equalize the differences in cost of production in the United States over similar articles produced elsewhere." The receipts from duties on imports, which were $334,000,000 in 1910 and $324,000,000 in 1920, rose to $549,000,000 in 1925. The public debt, which for many years previous to 1917 stood at about $1,000,000,000, was $26,594,268,000 after the close of World War I (Aug 31, 1919); but on June 30, 1926, had been reduced to $19,643,183,000, partly by selling surplus war material and chiefly by payments made out of surplus.

Industry and Commerce.—However much the wealth of the nation increased, large areas of the country were far from prosperous. The rural credits banks, established under President Wilson, furnished needed capital, and the farmers from 1917 to 1919 had a guaranteed government price of $2.20 per bushel for wheat. When that protection was taken off after the war, a group of members of congress in both house and senate, commonly called the agriculturist bloc, demanded special consideration for the agriculturists. Prices had tumbled and agricultural land values, inflated during the war, fell back to or below ante bellum prices. The cost of living had nearly doubled. Discontent was reflected in the large popular vote for La Follette in 1924 Various propositions were made by farmers' associations and sympathetic members of congress that the federal government permanently guarantee a price for the principal staples. The south was also affected by this movement because the inroads of the boll weevil for a time greatly reduced the output. In some degree the conditions of 1885–95 were reproduced; only it was no longer east against west so much as it was the farmers of all sections against the group of manufacturers and distributors wherever established.

In spite of federal suits and supreme court decisions substantially upholding federal control under the Sherman act, the Mann-Elkins act and other measures against combinations, consolidations of capital went on steadily. The railways, which had been sustained during World War I by the government, were returned to their owners in 1920. For several years, notwithstanding a great increase in passenger and freight rates during the war, they were unable to make a fair profit Under the Esch-Cummins act of 1920 they were allowed to retain a profit of 5½% earnings, plus one-half of 1% to make provision for improvements chargeable to capital accounts, all excess over 6% to be evenly divided with the government. Meanwhile the administrative commissions lost prestige. The Tariff commission was disregarded. The Labor board was unable to enforce its decisions. The Interstate Commerce commission and the Federal Trade commission suffered in prestige and influence from internal strains and quarrels The special Shipping commission, created during the war to build up a national merchant fleet, was left with a large number of vessels for which profitable business could not be found. The supreme court decisions, under which great corporations like the Standard Oil company and the American Tobacco company were regulated, left them more prosperous than ever. The hold of the great banks and the smaller banks and bankers on the finances of the country was unshaken Deposits in national and state-chartered banking institutions in 1925 aggregated more than $40,000,000,000.

Social Questions.—During World War I the United States offered extraordinary wages in order to activate the pursuits necessary to supply the armed forces This led to a general rise in wages of skilled workers, some increase for the unskilled and considerable increase in the earnings of domestic and agricultural workers The labour unions made it their business to see that no systematic reduction of wages should succeed. In 1923 and again in 1925 came serious strikes of the miners' unions. The last one endured 170 days, and was settled only with great difficulty

The most serious social question and most difficult governmental problem was national prohibition (*see* PROHIBITION) In 1918, while 30 states had laws on their statute books for the restriction of the liquor traffic, 28 states prohibited it outright. A prohibition (18th) amendment to the federal constitution was passed by the congress, was ratified by a vote of 46 state legislatures and became a part of the constitution Jan. 16, 1919 On Oct 28, 1919, the Volstead act for enforcing the amendment was passed by congress over the veto of President Wilson. It forbade the sale or transportation of "intoxicating liquor" which was defined as any liquor which contained one-half of 1% of alcohol. To administer this act required a large force of officials distributed over the country. The amendment contained a clause under which the states were to have "concurrent jurisdiction," which appeared to mean that state laws might continue in force and be carried out by state courts. From the very beginning there was an organized system of evasion of the laws. A regular system of "bootlegging," illegal sale and transportation sprang up It was countered by "highjackers"—that is, bandits who seized bootleggers' supplies and carried them off by force, knowing that they were not likely to be followed by officers of the law. An organized marine bootlegging trade placed a line of foreign sailing craft and steamers just outside the three-mile limit of the United States, whence they supplied the markets of the adjoining coasts

The United States entered into treaties with Great Britain and other nations in which it was agreed that vessels carrying their flags might be captured within that distance from the United States coast which could be traversed in one hour by the vessel suspected of endeavouring to commit an offense. Within the United States large numbers of otherwise law-abiding persons bought and sold or gave away bootleg liquor, and the difficulties of executing the law were shown by the figures of national enforcement In one fiscal year (1924–25) 20,000,000 gal. of distilled and fermented liquors were seized; 77,000 persons were arrested; 50,000 criminal cases were entered against bootleggers; 35,000 pleas of guilty were entered; and 38,000 convictions were obtained. A national law regulating the traffic in habit-forming drugs was enacted May 26, 1922.

National Defense.—The armies were returned and disbanded after World War I as quickly as possible; but a demand was made at once for some immediate acknowledgment of their services The government had attempted to head off this movement by an elaborate system of life insurance. It also instituted a large rehabilitation system for training disabled veterans in pursuits in which they could earn their own living. The government provided

hospitals and care for sick and disabled soldiers. Provision was made for special privileges to former soldiers. On Sept. 20, 1922, a national bonus bill was defeated by President Harding's veto On March 18, 1924, a bonus bill was passed by a large majority vote in congress, it was vetoed by President Coolidge but passed over his veto, May 17–19.

Notwithstanding the experience of the United States in 1917, when it declared a war without any mobile army, strong pressure was put on congress to reduce the regular army. By an act of Feb. 12, 1925, the force of the regular army was set at 125,000 enlisted men and 7,863 enlisted men of the Philippine scouts Many veterans joined the American Legion, the most widely distributed society of servicemen; and that body had considerable influence in the legislation for former soldiers.

International Relations.—President Coolidge, accepting the resignation of Charles E. Hughes from the department of state, appointed as his successor (Feb. 1925) Frank B. Kellogg, previously a senator and ambassador to Great Britain To the powerful chairmanship of the committee on foreign relations, after the death of Henry Cabot Lodge of Massachusetts, succeeded William E. Borah of Idaho (Dec. 1924). A great improvement in the conduct of foreign relations was introduced by the Rogers act, which took effect July 1, 1924, and under which the consular and diplomatic services were merged and the policy of training young men with the prospect of lifelong service was adopted.

The general policy of the United States toward other nations was much affected first of all by changes in international trade caused by the disruption of World War I; then by the refusal of the senate in 1919 to approve the Versailles treaty and further by a strong popular opposition to any formal relation with the League of Nations. A treaty with Germany (July 2, 1921) formally restored peace, provided for commerce and arranged for an adjustment of claims. Similar treaties were made shortly afterward with Austria and Hungary. The Lausanne treaty with Turkey, signed on July 24, 1923, was defeated in the senate on Jan. 18, 1927.

An important question of the early 1920s, partly social and partly international, was that of immigration, which went through a new phase because of the rush of people from other parts of the world as soon as the war was ended. Complaint was made that in the previous two decades the greater number of immigrants came from southern and eastern Europe, and were not by tradition and inheritance of the same type as most of the previous immigrants. Several changes were made in 1918 to reduce the number of "undesirables," yet the year 1920–21 brought 800,000 immigrants. By an emergency act of 1921 a quota was provided, assigning to each nation 3% of the nationals in the United States according to the census of 1910. By the act of 1924, a permanent quota system was enacted, based on 2% of the number of nationals of that country shown to be in the United States by the census of 1890. After July 1, 1927, the limit was placed at 150,000 annually.

Among the incidents of foreign relations after World War I was the recognition of various new countries created by the treaty of Versailles· Poland, Latvia, Lithuania, Estonia, Finland, Czechoslovakia, Yugoslavia, Hungary and the enlarged Rumania In 1924 the United States received a minister from the Irish Free State. The British government consented to the appointment of a Canadian representative at Washington.

The last U.S. troops were withdrawn from Germany in 1923. Meanwhile a joint commission on German claims was far advanced in its task. A troublesome difficulty was that a treaty with Prussia, entered into in 1828 and assumed in 1871 by the German empire, entitled German citizens in case of war to nine months to dispose of their property in the United States and leave the country. Instead, all discernible property of Germans, and particularly of German corporations, was seized at the beginning of the war and placed in the hands of a custodian of enemy property. Valuable German patents were turned over, for a very small payment, to U.S. manufacturing chemists. It was not until March 10, 1928, that President Coolidge signed a bill appropriating $50,000,000 to cover the value of the property seized.

Reparations and Allied Debts.—The United States was no party to the provisions of the Versailles treaty providing for German reparations, particularly to France, and the payment of an indemnity by Germany. However, the costs of the U.S. force of occupation were to be paid by Germany In 1921, when Germany did not pay the stipulated sums to the Allies, the French occupied the Ruhr valley The United States suggested a commission which, headed by Charles G Dawes, succeeded in working out a plan (1924) that was acceptable to France, Great Britain and Belgium, for a method of payment secured by a lien on German railways and factories. Financially the importance of the Dawes plan to the United States was that it cleared the way for considerable investments of private capital in German municipal and corporate securities.

A serious and difficult issue was that of the sums lent by the United States to other governments during World War I, aggregating $9,500,000,000. Without those large advances the Allies would have broken down economically before a U.S army could have been placed in Europe Nearly all the allied European countries shared in these advances At the end of 1922 the total principal was about $10,000,000,000 and the accumulated interest $1,500,000,000 more. This sum was funded in United States government bonds placed at about 4% interest, mostly in U.S hands, upon the same footing as other obligations of the government The interest was paid by the United States treasury. In 1923 the first important adjustment of the debt was made by an agreement with England (Feb 28, 1923). The whole amount of the principal and interest then due was funded at $4,600,000,000 to be paid in annual instalments beginning with $23,000,000 a year and increasing, until in the 62nd year the debt and accruing interest would be extinguished.

In April 1926, following an unsuccessful visit of a French debt commission to the United States in Sept. 1925, the Bérenger-Mellon settlement was finally arrived at with France

The total amount of the French indebtedness to be refunded, after a cash payment to adjust the sum to round figures, was declared to be $4,025,000,000, and the repayment of this amount with interest was to be spread over 62 years as in the other war debt settlements The total sum to be received by the United States under this agreement amounted to $6,847,674,104, an increase of approximately $627,000,000 over the previous French offer made by M Caillaux in 1925.

Comparing the French settlement with those of Great Britain and Italy, the figures worked out as follows: Great Britain's debt after discounting represented slightly more than 80% of its total obligation, France's approximately 50% and that of Italy 26%. The house of representatives voted approval June 2, but ratification by the senate was deferred pending the action of the French legislature The various agreements made to the end of April 1926 left only $295,000,000 of unfunded World War I debts to the United States, including $193,000,000 owed by Russia In nearly all cases the period of payment was so long and the interest so low that the settlements involved payment at the value of from one-quarter to more than three-quarters of the original advances by the United States.

Latin America.—With Latin America the United States in the main enjoyed peaceful relations during this period. The long-standing question of the Isle of Pines was adjusted by a treaty (March 13, 1925), under which the title of Cuba was acknowledged. At the request of Chile and Peru, President Harding agreed in 1922 to arbitrate the dispute over the ownership of the Tacna-Arica region. After Harding's death President Coolidge took up the task and rendered his decision (March 4, 1925) to the effect that the delayed plebiscite of the inhabitants should now be taken; and General Pershing was made the head of a commission to preside over this process. Chile objected, and nothing was done.

With Mexico relations became strained by a dispute over the application of the new Mexican constitution of 1917 under which aliens were forbidden to hold lands or concessions. Mexicans claimed that this was in accord with the practice of several states in the United States. In 1925 Secretary of State Kellogg pro-

tested against the attitude of Mexico as unfriendly and declared that the government of Mexico was on trial before the world. In March 1926 a financial understanding was reached

The League of Nations.—After the refusal of the United States to ratify the treaty of Versailles or to take part in the League of Nations, no official relations with the League were established However, large numbers of U.S citizens were interested in the work of the League and some of them were appointed to advisory committees in which, however, they did not represent the U S. government. Eventually the United States consented to appoint official delegates or "observers" to the League commission on opium traffic. The United States became a party to treaties, with regard to the white-slave trade, drawn up by the League but to take effect for only such countries as might ratify them. Gradually even the warm friends of the League accepted the view that it was useless for the time being to urge participation by the United States in the League

The World Court.—Down to 1914 the International Court of The Hague, founded in 1899 and strengthened in 1907, was functioning and rendered occasional decisions. It was, however, entirely ignored by the contending parties in the six wars that broke out from 1900 to 1914 and after World War I it remained ineffective. Elihu Root, who had a share in framing the court, came forward in 1920 as the leader of an unofficial group of experts in international affairs, to propose a new world court with wide powers and jurisdiction An advisory committee of jurists sat at The Hague and drew up a plan for the Permanent Court of International Justice. The League of Nations accepted the project and established the court (Dec 1920) and chose the judges (Sept 1921). (*See* PERMANENT COURT OF INTERNATIONAL JUSTICE) The United States had no official relation with the court, but the force of U S. public sentiment for a world league concentrated on a proposition for qualified entrance of the United States into the World Court.

This was warmly urged by President Harding and later by Presidents Coolidge, Hoover and F. D Roosevelt. Strong opposition was made in the United States on the plea that the court was an entering wedge to the League of Nations. The whole discussion was presently merged in consideration of proposals for the outlawry of war (A B H ; E. E. R.)

FROM 1926 TO WORLD WAR II

President Coolidge and Congress.—In the mid-term congressional elections of 1926 the Democrats captured 7 of the contested seats in the senate, wiping out the Republican majority in the 69th congress, and gained 13 seats in the house, making the complexion of the 70th congress (1927–29) 237 Republicans, 195 Democrats, 3 Independents in the house, and 48 Republicans, 47 Democrats, 1 Farmer-Labourite in the senate. The election foreshadowed embarrassment for the administration Elimination of the Republican margin in the senate made it necessary for that body to conciliate the insurgent members who had supported La Follette in 1924 and had been punished therefor by being dropped from important committee assignments in the 69th congress The Republican progressives, like Robert La Follette (the younger), John Blaine, Lynn Frazier and Gerald P. Nye, were now restored to regular standing, and exacted from the floor leader, Charles Curtis, as the price of their support of the party the promise that "certain legislation of paramount interest to the people" (farm relief, investigation of U S policy in Latin America, a bill to regulate the issuance of injunctions) should be brought to a vote during the first session of the 70th congress On these questions, as on several others of major importance, such as the details of tax reduction, the disposition of Muscle Shoals, the naval program, Mississippi flood control, the method of prohibition enforcement, President Coolidge found himself at odds with congress. He did not, however, attempt to drive congress, as Theodore Roosevelt and Wilson had done. With characteristic patience he held to his policies, vetoing 16 bills and resolutions in the first session of the 70th congress (Dec. 5, 1927–May 29, 1929), and insisting in his messages and speeches on obedience to law and on rigid economy.

National Finances.—The era of prosperity which set in at about the time of Coolidge's accession to the presidency continued unabated during his entire administration Except in a few "spots," such as the bituminous coal and textile industries, production mounted steadily, consumption kept pace and labour was well employed and content. The national wealth, which had stood at about $7,000,000,000 in 1850, $25,000,000,000 in 1870, $65,000,000,000 in 1890 and $350,000,000,000 in 1920, was approaching the $450,000,000,000 mark by 1929. The annual income had reached $90,000,000,000 and annual savings were more than $17,000,000,000. The United States was investing about $2,000,000,000 of surplus wealth abroad and diminishing the national debt by nearly $1,000,000,000 each year The abundant receipts of the treasury (more than half from income taxes), combined with the careful co-operation of the committees of the administrative departments under President Coolidge and Director of the Budget Herbert M Lord, resulted in substantial surpluses at the end of every fiscal year. On Feb 26, 1926, the president signed a bill for a tax reduction of $388,000,000

In spite of the cut in taxes the surplus continued to mount, and on May 29, 1928, the president signed the third tax reduction bill of his administration (relieving corporations and certain industries but leaving the personal schedules unchanged), involving a cut of about $220,000,000. The refunding of the Second and Third Liberty Loans in 1928 effected a saving to the government of $75,000,000 a year in interest charges. As President Coolidge's term drew toward a close, however, the prospect for further tax reduction vanished, and there was even some apprehension that the treasury might be confronted for the first time in the administration with a deficit instead of a surplus This was caused by certain extraordinary demands on the government, such as the appropriation of $75,000,000 for the refund of taxes illegally collected, of $50,000,000 for the settlement of claims arising out of taking over alien property during World War I, of nearly $50,000,000 for a public buildings program and of about $20,000,000 for initiating work on the vast $315,000,000 program for federal engineering work on the lower Mississippi river.

National Defense.—Since it was still the view that the geographic position of the United States brought immunity from fear of attacks by strong and hostile neighbours, the country followed the traditional policy of a small and well-equipped army supplemented by state militia The regular army of about 132,000 men meant only 1.1 soldiers to every 1,000 of population and every $3,250,000 of national wealth Reduction of land armaments was not a problem in which the United States was directly interested But the government worked diligently for the reduction of naval armaments After the failure of a proposed conference on disarmament, President Coolidge came out more positively for a "policy of adequate defense." A five-year building program had been approved by Secretary of the Navy Curtis D Wilbur in the summer of 1926, calling for 71 new vessels (cruisers, submarines, destroyers and carriers) to cost nearly $800,000,000 Cutting this program to 15 cruisers and 1 aircraft carrier, the house, on March 17, 1928, passed a bill for the construction of the 16 vessels in three years at a cost of $274,000,000. The cruiser bill was put over to the short session of the senate, where it met sharp opposition, especially as it was pending at the same time as the ratification of the Kellogg pact for the renunciation of war as an instrument of national policy. However, the bill was passed on Feb 5, 1929, by a vote of 68 to 12, and was signed by the president. On Feb. 28, 1929, congress agreed to a $12,370,000 addition to the naval appropriation for the new vessels, $200,000 to be available at once for starting the 1929 group of five and $200,000 to be available on July 1, 1929, for the beginning 1930 group. The progress of aviation began to play a great part in the field of national defense

Railroads and Shipping.—During World War I the major agencies of transportation had been taken over by the government. The railroads were restored to their owners on March 1, 1920, by the Esch-Cummins Transportation act. The physical valuation of the railroads by the Interstate Commerce commission, as a basis for rate fixing, which had been authorized in 1913

and interrupted by World War I, was to serve as the basis of the "recapture" clause of the act of 1920, by which one-half of the earnings in excess of 6% should go to the government. This provision promised endless litigation. The validity of the commission's method of valuation was presented to the supreme court of the United States in the case of the St Louis and O'Fallon railroad, called "the greatest lawsuit in history" because of the immense sums involved in the right of the government to recapture excess earnings. This railroad's earnings in excess of 6% of the commission's valuation had been ordered paid to the government. The court, with Justices Oliver W Holmes, Louis Brandeis and Harlan Stone dissenting, rejected the commission's valuation on the ground that no weight had been given to "reproduction" cost. (49 Sup. Ct. Rep. 384.) But, since no criteria were laid down as to how much weight was to be given to this factor, the decision could not be said to be decisive.

At the close of World War I the United States Shipping board had on its hands a large number of merchant ships seized from Germany or constructed by the Emergency Fleet corporation. Many of the smaller cargo ships the board sold as junk, but it maintained the larger vessels in the passenger and freight service. In 1923 five ships of the "President" class were purchased by the Dollar line. By the Jones-White act of May 1928, congress reluctantly appropriated $250,000,000 for the maintenance of the fleet and loans for the construction of new vessels. On Jan 16, 1929, the Shipping board received a bid from the P. W. Chapman company of New York, which was to pay $16,082,000 for the "Leviathan," the "George Washington," the "America," the "Republic," the "President Harding," the "President Roosevelt" and the five ships of the American Merchant line, and promised to build, with the aid of a government loan, two new vessels "superior in type and size to the 'Leviathan.'"

Efforts at Farm Relief.—In the midst of general prosperity the farmers complained that they were poorer. The value of their capital investment had shrunk from $70,000,000,000 to $59,000,000,000 in the five-year period 1922–27, and the return on this capital was less than 3%. While overproduction kept the prices of their products down, state and local taxes and the cost of farm implements and machinery were rising. The farmers asked the government to come to their relief (as it helped the manufacturers by the tariff, and labour by the restriction of immigration) by purchasing their surplus product of wheat, corn, cotton, hogs and tobacco and selling it abroad for what it would bring in the world market, assessing the loss and the cost of the operation on the industries benefited (the "equalization fee"). The McNary-Haugen bills embodying these demands were kept before congress during the last three years of the Coolidge administration. The first bill failed of passage in the late spring of 1926, but in Feb. 1927 a McNary-Haugen bill went through both houses. President Coolidge vetoed it because it put the government into the farming business, though he was willing to help the farmers help themselves by generous contributions to co-operative marketing projects and by aid from the department of agriculture. The veto was accompanied by an opinion from Att. Gen. John Sargent condemning certain features of the bill as unconstitutional. Nothing daunted, the advocates of farm relief came forward with a third McNary-Haugen bill, which passed congress by increased majorities in the spring of 1928, only to meet with a second veto from the president (May 23). The senate failed by the margin of 50 votes to 31 to pass the bill over the veto. On the first day of the short session of the 70th congress (Dec. 4, 1928) the fourth McNary-Haugen bill was introduced, this time without the equalization fee. No action was taken on it during the session, but President Hoover called an extra session of the 71st congress to meet on April 15, 1929, to deal with farm relief and the revision of the tariff. President Coolidge's vetoes of the farm relief bills roused opposition in the west and led to predictions that the farming sections of the country would not support an administration candidate for the presidency in the campaign of 1928. But Hoover carried every one of the agricultural states (*see* below).

Latin-American Relations.—The controversy with Mexico over her legislation to put into effect the provisions of article 27 of the constitution of 1917, regulating alien exploitation of mineral and agricultural lands, was further embittered by the appeal made to the Catholics of that country against Pres. Plutarco Calles' measures against the foreign clergy of the Roman Catholic Church in Mexico, and by the report that the Mexican bolshevists were encouraging the rebels in Nicaragua in their resistance to the U.S. marines. So serious was the situation at the beginning of 1927 that the United States senate by a unanimous vote asked President Coolidge to submit the controversy with Mexico to arbitration. The president ignored the request, but in the autumn he sent Dwight W Morrow, of the firm of J. P. Morgan & Co., as ambassador to Mexico. Morrow's friendly and tactful diplomacy resulted in an early agreement with President Calles, and the amicable relations of the two countries were greatly strengthened when Col Charles A Lindbergh, after a nonstop flight from Washington, arrived at Mexico City (Dec. 14, 1927) as a U.S. "ambassador of good will."

President Coolidge, in spite of criticism in congress and in the liberal press of the country, held to his policy of maintaining about 5,000 marines in Nicaragua to quell the revolt against Adolfo Díaz and to protect U S. lives and property. The forces of Díaz and Juan Sacasa agreed to lay down their arms when Coolidge sent Henry L. Stimson to Nicaragua with an ultimatum in April 1927, but the rebel leader Augusto Sandino continued a guerrilla warfare in which 20 U.S. marines were killed and 50 wounded. When Sandino was overcome, both parties agreed to an election, which was held under the supervision of U S troops (Dec 4, 1928) and resulted in the victory of the Liberal candidate, José Moncada.

The sixth Pan-American congress was opened by President Coolidge in person, at Havana, Cuba, on Jan 16, 1928. Charles E. Hughes headed the U.S. delegation, and steered the conference away from the embarrassing political questions raised by the United States intervention in Nicaragua. A supplementary Pan-American Conference on Arbitration and Concihation met at Washington, D C, on Dec. 10, 1928, which not only negotiated a score of arbitration treaties between the Latin-American nations, but was influential in keeping Bolivia and Paraguay from going to war over disputed territory.

The Briand-Kellogg Peace Pact.—On the tenth anniversary of the entrance of the United States into World War I (April 6, 1927), the French foreign minister, Aristide Briand, proposed that the United States and France should agree to a treaty renouncing war as an instrument of national policy, and agreeing to settle disputes of whatever origin or nature by pacific means. Secretary of State Kellogg replied, suggesting that the treaty be extended to other nations. On Aug. 27, 1928, the representatives of 15 nations met at Paris and signed the Briand-Kellogg pact. Secretary Kellogg represented the United States at Paris. On Jan. 15, 1929, the senate ratified the pact.

The Election of 1928.—President Coolidge having announced that he would not run for the presidency in 1928, the field was left open for Secretary of Commerce Herbert C. Hoover, who was easily nominated, receiving 837 out of the 1,084 votes cast in the first ballot, at the nominating convention at Kansas City, June 12–15, 1928. The delegates to the Democratic nominating convention at Houston, Tex., on June 26–29, cast 849½ votes out of 1,100 for Alfred E. Smith, then serving his fourth term as governor of New York. Sen. Charles Curtis of Kansas and Sen. Joseph T Robinson of Arkansas were named as the respective vice-presidential candidates. Each of the four nominations was made on the first ballot cast. The platform of the Republican party promised farm relief and a careful revision of the tariff, defended the Coolidge policy in Nicaragua and adopted a prohibition plank written by Senator Borah, pledging the administration to a "vigorous enforcement" of the 18th amendment. The Democratic platform contained a scathing denunciation of the "sordid corruption and unabashed rascality" of Republican rule, which had left "agriculture prostrate, industry depressed, and workmen without employment," and pledged action instead of broken promises for the relief of the farmer. Governor Smith telegraphed to Chairman Joseph Robinson of the convention endorsing the platform in general, but adding that it was his duty as the chosen

leader of the party to say that he advocated "fundamental changes in the present provisions for national prohibition." Hoover made only a few campaign speeches. Governor Smith, on the other hand, toured the country and discussed definite policies which he proposed to adopt if he were elected. On election day, Nov. 6, 1928, Hoover carried 40 of the 48 states, including four (Virginia, North Carolina, Florida and Texas) which had been Democratic since the days of reconstruction. The electoral vote was 444 for Hoover to 87 for Smith. But the popular vote of 21,391,381 to 15,016,443 indicated no such crushing defeat for the Democratic candidate. The Socialist candidate, Norman Thomas of New York, polled 267,835 votes; the Communist party candidate, William Z. Foster, 21,181; the Socialist-Labour candidate, V. L. Reynolds, 21,603; and the Prohibitionist candidate, William Varney, 20,106. Hoover's invasion of the "solid south" was attributed by the Democrats to the prejudice in that section against Governor Smith as a "wet" and a Roman Catholic, while the Republicans saw in it the swing of the south toward tariff-protected industry and the recognition of Hoover's wide experience as an executive Soon after the election Hoover sailed from San Diego, Calif , on the battleship "Maryland," for a good-will tour to the countries of Central and South America He visited Honduras, Nicaragua, Costa Rica, Ecuador, Peru, Chile, Argentina, Uruguay and Brazil.

Hoover retained Secretary of the Treasury Mellon and Secretary of Labour Davis of the Coolidge cabinet in office, the former remaining until Feb. 1932 when he was appointed ambassador to Great Britain, and was succeeded in the treasury department by Undersecretary Ogden L. Mills; and the latter resigning the secretaryship of labour in 1930 to run for U.S. senator from Pennsylvania, being replaced in the cabinet by William N. Doak of Virginia. The eight new appointees (none from the states of the south which Hoover had carried) were Col. H. L. Stimson, governor general of the Philippines, for secretary of state; James W. Good of Iowa, secretary of war (succeeded in December by P. J. Hurley of Oklahoma); William De Witt Mitchell of Minnesota (a conservative Democrat), attorney general; Charles Francis Adams of Massachusetts, secretary of the navy; Walter F. Brown of Ohio, postmaster general; Ray L Wilbur of California, secretary of the interior; Arthur M. Hyde of Missouri, secretary of agriculture; and Robert P. Lamont of Illinois, secretary of commerce, succeeded in 1932 by Roy D. Chapin of Michigan.

The Agricultural Marketing Bill.—In accord with the campaign pledge President Hoover called the 71st congress (senate 55 R., 39 D., 1 F. L.; house 269 R , 165 D., 1 F. L.) in special session on April 16, to consider the problems of farm relief and the revision of the tariff. After the senate had tried in vain to insert a debenture clause into it, an agricultural marketing bill was passed by large majorities and signed by the president on June 15. The bill aimed at the encouragement of producer-owned and producer-controlled co-operative associations, which should eliminate wasteful methods of distribution and prevent the accumulation of surpluses which caused "undue and excessive fluctuations or depressions" in the prices of agricultural products. It created a federal farm board of nine members (including the secretary of agriculture), and provided a revolving fund of $500,000,000 from which loans were to be made to the farmers' co-operatives at a rate of interest not to exceed 4%. For a few months the Farm board promised to be a great success. New co-operatives were formed for the marketing of grain, fruit, cotton, vegetables and livestock, and the board approved loans to 132 co-operatives, totalling $165,000,000. But as farm prices continued to sag in the disturbed condition of world markets, it became evident that the farmers could not borrow themselves out of debt. The board then departed from its announced plan of not buying or selling farm products itself. The government entered the market and backed the grain and cotton Stabilization corporations by purchasing 330,000,000 bu. of wheat and more than 1,000,000 bales of cotton, in the endeavour to peg the prices of these commodities by holding the surpluses off the market. The endeavour failed; and at the close of 1931 the books of the board showed a loss of about 50% on the $378,000,000 advanced for the purchases It was evident that the agricultural problem was no nearer solution in 1932 than it had been in 1922 The farmer, because of high taxes, tariff walls and world depression, could not sell his staple crops for what it cost to raise them.

The Hawley-Smoot Tariff.—A "limited revision" of the tariff had been advocated in the Republican party platform and recommended by President Hoover. But the bill passed (264 to 147) by the house on May 28, 1929, bearing the name of W C Hawley of Oregon, chairman of the ways and means committee, increased the duties on more than 1,000 articles, raising the average rates far above those of the Fordney-McCumber act of 1922. In the senate the insurgents (Borah, George Norris, La Follette, Brookhart, Frazier and Nye) fought against the high rates. The final vote on the bill (June 13–14, 1930) was 44 to 42 in the senate and 222 to 153 in the house. President Hoover signed the bill, justifying his action on the ground that the "flexible" provision permitting him to alter the rates within a compass of 50% on advice of the Tariff commission would enable him to remedy any injustices in the bill. The evil effects of continuing to maintain a Chinese wall around the country, when the health of world commerce depended on international co-operation, were soon evident Before the close of 1931, about 25 foreign countries had raised their tariff walls, chiefly against U.S. goods, by way of reprisal Debtor nations, whose only means of payment was the shipment of merchandise to the U.S., found their goods shut out by the customs barrier. In the 17 months preceding June 1930, U.S. exports had been $6,828,000,000 and U.S. imports $5,766,000,000. In the next 17 months these figures had dropped to $4,007,000,000 and $3,262,000,000 respectively—a total shrinkage of $5,326,000,000 in U.S. foreign trade. Widespread depression in Europe, revolutions in Latin America and riots and civil war in India and China were playing havoc with world trade.

The Wickersham Commission.—President Hoover was concerned with the widespread disregard for law, as evidenced by the operations of bootleggers, highjackers, kidnapers and racketeers and the failure of the courts to convict and punish criminals. The United States led the world in the sinister statistics of homicide, burglary, holdups, graft and defalcations. Gangsters armed with machine guns and provided with high-powered motorcars terrorized the cities and defied, bribed or cowed the sworn guardians of the law. The court records showed that the chances that the criminal would be convicted and brought to condign punishment were only about 3 in 100.

On May 20, 1929, President Hoover appointed a commission of 11 citizens, headed by former Att. Gen. George W. Wickersham, and including Newton D. Baker, Dean Roscoe Pound of the Harvard law school, and 3 federal judges, to investigate and report on the "dominant national problem" of the observance and enforcement of the law. After 18 months of investigation the commission submitted the first instalment of its report (Jan 19, 1931). This report, described by one newspaper as "the most astonishing document ever submitted to our government by a responsible committee," instead of clearing up the confusion of opinion on prohibition only made it worse. Ten of the 11 members signed the body of the report, which opposed the repeal of the 18th amendment or the modification of the Volstead act; but in individual opinions appended to the report only four members favoured the continuance of the law as it stood, while five recommended modification and two absolute repeal. The commission subsequently submitted a dozen reports dealing with the causes of crime, the machinery of the courts, penal institutions, police methods, probation and parole and the deportation of aliens.

The Stock Market Crash.—Long before the Wickersham reports were submitted, public interest was absorbed in the sudden eclipse of the prosperity which had seemed to all but a few to be established on a firm and enduring basis. For the first six months of the administration the road to wealth for all seemed to stretch broad and smooth before the American people. The prices of stocks soared to fantastic heights. Billions of dollars were drawn from the banks into Wall street for brokers' loans to carry margin accounts. In the midsummer of 1929 about 300 000.000 shares of stock were being carried on margin.

In Oct. 1929 the market broke, and the wild rush to buy stocks gave way to an equally wild rush to sell. On Oct. 29 16,410,030 shares were thrown on the market for what they would bring Prime securities tumbled like the issues of bogus gold mines General Electric fell from 396¾ on Sept 3 to 210 on Oct. 29 American Telephone and Telegraph dropped 100 points. du-Pont fell from a summer high of 217¼ to 80; United States Steel from 261½ to 166¼; Delaware and Hudson from 224¾ to 141; Radio common from 505 to 26. Savings of a lifetime were wiped out. Political and financial leaders at first affected to treat the matter as a mere spasm in the market. President Hoover and Secretary Mellon made optimistic predictions that business was "fundamentally sound" and that a great revival of prosperity was "just around the corner." In Jan 1930 the president declared that the trend of business was "upward," in March, that the crisis would be over in 60 days, in May, that we had "passed the worst" and "would rapidly recover." Secretary Mellon saw "nothing in the present situation that warrants pessimism" But as the months passed it became evident that the nation was entering a period of severe depression. Foreign trade fell sharply, factories were closed, the number of unemployed grew alarmingly, mortgages were foreclosed, banks failed, dividends were passed, the prices of wheat, cotton, copper, oil and other commodities kept on sinking, the federal surpluses were turned into deficits and the buying power of the nation was paralyzed.

Efforts for Relief.—In Oct. 1930 President Hoover appointed a cabinet committee to formulate measures for the relief of unemployment. In December he laid before congress a vast program for road construction, public buildings, flood control and airways development, and signed 22 bills appropriating more than $300,000,000 for loans by the Federal Farm board, for emergency construction and for drought relief. In Oct 1931 he got the bankers to form a $500,000,000 pool to help rescue the weaker banks from failure, and on Jan. 22, 1932, he signed the bill creating a $2,000,000,000 Reconstruction Finance corporation, empowered to make loans to banks, insurance companies, agricultural associations, railroads and other industries. The management of the board was vested in seven directors under the chairmanship of Charles G Dawes, who had just resigned the post of ambassador at London. Democrats and Republicans joined in passing the bill.

The Plight of the Treasury.—It would have been comparatively easy for the treasury to provide the relief clamoured for if it had continued to enjoy the abundant revenues and the surpluses of the Coolidge administration. But the depression which had stopped the wheels of industry had also dried up the sources of revenue. Federal taxes from all sources were supplying only 50% of the expenses of the government at the beginning of 1932. Appropriations for national defense, the veterans' service and interest on the public debt absorbed every dollar of the national income The treasury deficit, which stood at $900,000,000 at the close of the fiscal year 1931, threatened to exceed $2,000,000,000 before June 30, 1932. Yet the demands on the treasury increased. In Feb 1931 both houses of congress had overridden by huge majorities (328 to 79 and 76 to 17) President Hoover's veto of a bonus bill, extending cash loans to the war veterans up to 50% of the face value of their adjusted certificates, at an estimated cost of $1,000,000,000. Agitation was immediately started for the full cash payment of the certificates, amounting to another $2,000,000,000, although the American Legion in its convention at Detroit in Sept. 1931 disapproved this "raid on the treasury" by a vote of 507 to 902. The treasury was still further crippled by the loss of about $238,000,000 which should normally have been collected from the debtor nations in Europe, when President Hoover, in order to save Germany from imminent financial collapse, proposed a year's moratorium on all Intergovernmental debts (June 20, 1931), both principal and interest.

Efforts to Balance the Budget.—The midterm elections, coming in the midst of the depression, naturally turned against the administration. The 72nd congress, which met on Dec. 7, 1931, saw the Democrats in control of the house (220 to 214) while the senate was almost equally balanced (48 R, 47 D.). However, a dozen senators from the agricultural states of the west who bore the Republican label could be counted on to join the Democrats in opposition to any administration policies that smacked of favours to the "special interests" Considering the distress under which the country was labouring, congress declared it would "postpone politics," much as it had done in the emergency of World War I, and Speaker John Nance Garner of the house rallied the Democrats to support the president's recommendations for the enlargement of the credit facilities of the banks (the Glass-Steagall act) and the creation of the $2,000,000,000 Reconstruction Finance corporation (Jan. 22, 1932). The leaders of both parties agreed that the budget must be balanced; but when it came to framing the necessary tax bill harmony ceased. Everybody knew that taxes must be increased if the deficit was to be wiped out, but nobody wanted them to be increased at his own expense The advocates of "soaking the rich" demanded high taxes on incomes, inheritances and stock transfers. Those who favoured spreading the burden over the consumers supported the sales tax recommended by the ways and means committee of the house. The bill which was passed by the house (April 1, 1932) and (after some inconsequential changes by the senate) signed by the president on June 6, was declared by Secretary of the Treasury Ogden Mills to be "inadequate" to check the growing deficit. About $1,118,000,000 was expected from its provisions, which raised the normal income tax to 8% on sums above $4,000, with supertaxes rising to 55% on incomes in excess of $1,000,000 Taxes were also levied on bank checks, telephone, telegraph and radio messages, and the sales of various luxury articles such as automobiles, radios and phonographs. But congress resisted the president's efforts to cut down government expenses In the first four months of the new fiscal year (July–Oct., 1932) the treasury deficit mounted by almost $700,000,000

Gestures Toward International Co-operation.—President Hoover was sincerely desirous of redeeming his inaugural pledge to co-operate with Europe in efforts for recovery from the political, financial and industrial chaos which World War I had produced throughout the whole world In 1929 an international committee of which Owen D. Young was chairman revised the Dawes plan (*see* REPARATIONS) of dealing with the reparations payments demanded from Germany. The Young plan, besides revising the amounts of the payments, tried to take the whole matter out of the realm of politics and national revenge and make it a scientific procedure of international finance, controlled by and operating through a bank of international settlements established at Basle, Switz. In October of the same year, the British prime minister, J. Ramsay MacDonald, visited the United States and held informal conversations with Secretary of State Stimson and President Hoover. The outcome was an invitation to the five naval powers of the Washington conference of 1921–22 to meet at London in Jan. 1930 for the purpose of controlling competition in those types of war vessels (cruisers, submarines, destroyers) which had not been included in the Washington agreement. The London conference lasted from Jan. 21 to April 22, 1930. France and Italy withdrew from the conference when they thought that their "security" in the Mediterranean was threatened; but the United States, England and Japan signed the London treaty, which extended the ban on battleship construction until 1936, fixed ratios for the building of auxiliary craft and established a definite naval "parity" between the United States and Great Britain. The treaty was disappointing to the advocates of naval limitation, however, because it permitted the nations to build up to a certain limit rather than scaling down naval construction and, by the "escalator clause," allowed them to increase the ratios if their security seemed to be threatened by other nations (France and Italy). Though Europe's armies were of less concern to the United States than the navies, the United States sent a full delegation to the Limitation of Armaments conference at Geneva on Feb. 2, 1932—and accomplished nothing.

The League of Nations and the World Court.—While not departing from the official position of nonmembership in the League, the United States gave some endorsement to Hoover's pledge in his acceptance speech of Aug. 11, 1928, that the country would be "glad to co-operate with the League in its en-

deavours to further scientific, economic and social welfare and to secure the limitation of armaments" By the autumn of 1931 the government had signed more than a dozen international agreements made under the League's auspices. In October of that year Prentiss B. Gilbert, U.S consul general at Geneva, sat at the table of the League council when it discussed the Japanese aggression in Manchuria, and a U S. general (Frank R. McCoy) served on the Lytton commission appointed by the League to visit Manchuria and report on the situation. The deadlock over the adherence to the World Court continued during the Hoover administration The venerable Elihu Root (who had helped frame the original statute of the court) went to Geneva late in 1928 and secured the assent of the statesmen there to the "Root Formula," which so guarded U.S. interests in the matter of advisory opinions that Secretary of State Stimson instructed our acting minister at Geneva to sign the protocol of adherence (Dec. 9, 1929). Just a year later President Hoover presented the protocol to the senate for ratification Senator Borah and the other determined opponents of the court in the committee on foreign relations prevented the protocol from being reported out to the senate until May 1932. By that time the presidential campaign was beginning to absorb the attention of the country, and there was little probability that the senate would take any action on the protocol until the election was over. Then the emergency measures of the New Deal under Pres. Franklin D. Roosevelt so absorbed congress and the public that action on the World Court was not taken until Jan 29, 1935. On that date 52 senators voted in favour of joining the court and 36 against—thus failing by seven votes to register the two-thirds necessary for ratification.

Campaign of 1932.—The Republican national convention met at Chicago on June 14, 1932, and renominated Hoover and Curtis on the first ballot. The platform stood pat on the merits of the Hoover administration, warned against the danger to business interests and national finances if the Democrats should come into power, and rejected a plan for a repeal of the prohibition amendment. The Democrats met on June 27, in the same building that the Republicans had vacated a few days before Though the primaries had given Gov. Franklin D. Roosevelt of New York a substantial majority of the delegates, he was still far short of the two-thirds (770) necessary for nomination An anti-Roosevelt group headed by Alfred E Smith, John J. Raskob and Jouett Shouse developed considerable strength in New England and New York. Nine candidates were put in nomination, including, besides Roosevelt and Smith, four state governors and the speaker of the house, John N. Garner of Texas Roosevelt had 666½ votes on the first ballot, to 201½ for Smith, 90½ for Garner and 195¼ divided among the other candidates. On the fourth ballot Garner released his delegates to Roosevelt and William G. McAdoo, who had been supporting Garner, threw the entire California delegation to the New York governor, who was nominated with 945 of the 1,154 votes. Roosevelt immediately flew from Albany to Chicago to deliver his acceptance speech to the assembled delegates. Garner was named for vice-president In the campaign which followed, Roosevelt had little difficulty in persuading the people that a change of administration, a "New Deal," was the only hope of recovery from the depression. Banks were failing by the hundreds. Mills and factories were shut down. The unemployed numbered more than 10,000,000. Mortgages on farms and homes were being foreclosed. National, state and local taxes were taking one dollar out of every three of the national income, and the public debt was increasing at the rate of $2,000,000,000 a year A "bonus army" of 10,000 to 20,000 men marched on Washington in the midsummer, determined to remain until congress voted them full cash payment of their adjusted certificates. A thousand farmers in Iowa picketed the roads to prevent the delivery of their grain, milk and livestock at prices which did not pay them for production. Roosevelt toured the country attacking the Republican administration and promising economy, a balanced budget, relief for the farmers and rehabilitation of business. Prominent Republicans, including Senators Johnson and Norris, supported him openly. Toward the end of the campaign President Hoover attempted to stem the tide that was running more strongly against him every week But it was of little avail The verdict at the polls on Nov 8 was a Democratic landslide. Roosevelt carried every state in the union except six (Maine, New Hampshire, Vermont, Connecticut, Delaware and Pennsylvania) with 472 electoral votes to 59 for Hoover, and a popular majority of approximately 7,000,000 The Democrats secured a majority of 191 in the house and 22 in the senate.

Two New Amendments.—The final short session of congress, which met in Dec. 1932, was the last of the "lame duck" sessions. For in Jan 1933 the 20th amendment to the constitution was ratified, which provided that thereafter the congress elected in November should begin its session on the third day of the following January, and that the president should be inaugurated on Jan. 20. The last "lame duck" congress also passed a 21st amendment in Feb. 1933 (ratified in December) repealing the 18th (prohibition) amendment.

The New Administration.—The cabinet, announced on the eve of the inauguration, consisted of Cordell Hull of Tennessee (state); William B. Woodin of New York, who resigned in December and was succeeded by Henry Morgenthau, Jr. (treasury); Homer S Cummings of Connecticut (attorney general); Gov. George H. Dern of Utah (war); Sen. Claude A. Swanson of Virginia (navy); James A. Farley of New York, chairman of the Democratic state and national committees (postmaster general); Harold L Ickes of Illinois (interior); Henry A. Wallace of Iowa (agriculture); Frances Perkins of New York, the first woman to have a cabinet seat (labour); and Daniel C. Roper of Washington, D C (commerce). Besides these official heads of departments, President Roosevelt took intimate counsel from a number of advisers who were called the "brains trust" because many of them were college professors. Notable among them were Raymond Moley (for a time assistant secretary of state), Rexford G Tugwell (later undersecretary of agriculture) and A A Berle of Columbia university, Felix Frankfurter (later supreme court justice) and O. M. W Sprague of Harvard; and George F Warren of Cornell. In his brief inaugural address the president scored the prevailing practices in industry and finance which he said had brought the country to distress in the midst of plenty, promised to drive the "money-changers" out of the temple, declared that the only thing the country had to fear was fear itself, and in words recalling Woodrow Wilson's inaugural of 20 years before asked the people to join him in a "national consecration" to the work of restoring prosperity through united effort.

Meeting the Crisis.—Shortly after the election President Hoover had invited President-elect Roosevelt to Washington to confer with him on measures that might ease the situation during the four months "interregnum" before the latter's inauguration. But Governor Roosevelt was not willing to commit himself to policies before the power and responsibility were actually in his own hands. The winter of distress wore on, and when inauguration day arrived the country was confronted with a crisis of the first magnitude. Beginning with Michigan in mid-February, state after state had closed its banks to prevent runs by panic-stricken hoarders. In the eight days preceding March 4, more than $1,500,000,000 had been drawn from the banks which were still open. The New York banks closed that morning by order of Gov. Herbert Lehman, and by noon every bank in the country had shut its doors. After a White House conference lasting well into the night of Sunday, March 5, President Roosevelt issued a proclamation closing all the banks for four days; and at the same time summoned congress to meet in extra session on March 9. On that day the house, without the formality of a roll call, and the senate, with only seven dissenting votes, passed the administration's Emergency Banking bill, giving the secretary of the treasury power to appoint "conservators" (quasi-receivers) for all the national banks in the country and to reopen them according to his discretion Confidence was restored and deposits began to flow into the banks again. But, unfortunately, too many of the weaker banks were reopened. The president's Economy bill, designed to save $500,000,000 by reducing federal salaries and veterans' pensions (signed March 20), was hailed with enthusiasm by the

country; but its effect was neutralized a year later (March 28, 1934) when congress passed over the presidential veto the Independent Offices bill, restoring most of the cuts. On March 22, 1933, a bill was signed legalizing the sale of 3.2% beer, from which a revenue of from $100,000,000 to $150,000,000 was expected for the treasury

The AAA.—The extra session sat from March 9 to June 16, 1933. In those 99 days an amazing amount of legislation was adopted The Agricultural Adjustment act of May 12 was designed to raise the prices of farm products and relieve the farmers, who were burdened by a mortgage indebtedness of $8,500,000,000. The plan was to take about 40,000,000 ac. out of cultivation, and to reimburse the farmers for the value of the crops and the hogs they would lose by a processing tax levied on flour millers, meat packers, etc. Of course this would raise the price of bread, bacon and clothing, because the processor would pass along the tax to the consumer Since there was a large group in congress who favoured inflation of the currency as the means of raising prices, it was necessary, in order to get the bill through, to adopt an amendment of Sen Elbert Thomas of Colorado, empowering the government to issue $3,000,000,000 of paper money and to reduce the gold content of the dollar by not more than 50% No greenbacks were issued, but on April 19 the government abandoned the gold standard by forbidding the export of gold, and the next January the president by proclamation reduced the gold content of the dollar to 59 06 cents This action, which made public and private bonds payable at 60 cents on the dollar, was subject to violent attack, but the supreme court, in Feb. 1935, upheld the devaluation by a vote of five to four The processing tax of the AAA brought in more than enough to pay the benefits to the farmers in the first year of its operation, but in 1935 was falling far behind, as cases involving its constitutionality came before the courts. In Jan 1936 the supreme court, by a vote of six to three (Stone, Brandeis, Benjamin Cardozo) declared the AAA unconstitutional.

The NRA.—Perhaps the most startling measure of the New Deal was the National Industrial Recovery act of June 16, 1933, by which the government assumed control over the major industries of the country Representatives of the industries were invited to come to Washington to work out with the NRA administrator, Gen. Hugh S Johnson, codes of fair dealing to be followed. These codes fixed *maximum hours* and *minimum* wages, abolished sweatshop and child labour in many industries, gave labour the right to bargain with employers through representatives of their own choosing (as against the open shop or the company unions), and required businessmen to open their books to government inspectors. Violators of the codes would have the Blue Eagle (the symbol of co-operation) taken away from them, and industries refusing to formulate a code were brought under a blanket code imposed by the president. More than 700 codes were drawn up by representatives of business From the first the NRA met violent opposition on both constitutional and economic grounds. The act was to expire in June 1935, and the administration was bent on asking for its extension when the supreme court, in the Schechter Poultry Corporation case, on May 27, handed down a unanimous decision that the codes by their wages and hours provisions exceeded the powers of congress under the interstate commerce clause, and that hence the NRA was unconstitutional At the same time the Frazier-Lemke Mortgage Relief act was unanimously declared unconstitutional.

Emergency Relief.—Two objects, not always easily separable, were envisaged in the program of the New Deal. immediate (emergency) relief for the millions of unemployed who could no longer be taken care of by private charity or state and local funds, and long-time plans for the recovery of business and agriculture On May 12, 1933, a Federal Emergency Relief act appropriated $500,000,000 for direct aid, one-half the sum going as a gift to supplement the amounts raised by the states and the other half to match state appropriations in the ratio of one to three. This was followed by various acts to create jobs for the unemployed at federal expense, such as the Civilian Conservation corps and the Civil Works administration. By June 1934, the total "emergency" expenditures of the government under such public works schemes, the RFC and the AAA amounted to more than $5,000,000,000 Dismayed at the burden of public debt being piled up for a future generation to pay in taxation, critics of the New Deal called for an end to extravagant spending, tinkering with the dollar, price and wage fixing and, in the words of the Republican *New York Herald Tribune*, "the whole succession of unrelated and hastily devised remedies . . . that had produced an economic chaos with no end in sight." President Roosevelt still had the confidence of the people, however. In the mid-term elections of 1934 the administration won a complete victory. The Democrats secured 322 of the 435 seats in the house and 69 of the 96 senators for the 74th congress.

President Roosevelt asked and obtained from the new congress in Jan 1935 the sum of $4,880,000,000, to be spent virtually at his own discretion Scores of alphabetical agencies were at work dispensing huge sums for relief and for constructive work. The projects of the Tennessee Valley authority and the Grand Coulee and Bonneville irrigation plants were being pushed The public debt in the autumn of 1935 passed the $30,000,000,000 mark—exceeding by nearly $4,000,000,000 the World War I debt at its peak. With the adjournment of congress in Aug. 1935, after the passage of the National Security act providing for old-age and unemployment pensions, the attention of the country turned to the approaching presidential race.

The Recovery of Business.—Shortly after the adjournment of congress President Roosevelt wrote (Sept. 6, 1935) to Roy Howard, in reply to a letter asking for "the grant of a breathing spell to business and a recess from further experimentation," that the basic program of the administration "has now reached substantial completion and the breathing spell of which you speak is here—very decidedly so" Since the autumn of 1934 the upturn in business had been steady, if not rapid. Railroads, banks and insurance companies were paying back their loans from the RFC. Firms which had been deep in the red were cutting their deficits and going on to make profits. Dividends were resumed. Wages and salaries were stepped up The farm income rose from $5,300,000,000 in 1932 to $8,000,000,000 in 1935. Foreign trade, which had reached its nadir of $2,933,000,000 in 1932, increased to $4,329,000,000 in 1935. Opponents of the New Deal insisted that the tide of prosperity would be rising far more rapidly were it not for the uncertainty in business circles as to what further measures of government interference the president might recommend Nevertheless the indisputable fact of business improvement, a fact which the president emphasized more and more strongly in his speeches and press conferences, was a powerful factor in holding for him the continued confidence of the nation.

The Growing National Debt.—In spite of the fact that business was improving, the treasury was showing staggering deficits from year to year. The numbers of the unemployed still remained, after three years of enormous expenditures for relief, somewhere between 10,000,000 and 12,000,000. In his budget message of Jan. 1936 the president asked congress for $1,425,000,000 for relief work, in addition to the $4,880,000,000 which he had obtained the previous year. By June 1936 it was estimated that close to $9,000,000,000 had been appropriated for relief, direct and indirect, and two further features added to the immense burden of debt which the relief work was imposing upon the government. First, the disallowance of the AAA by the supreme court on Jan. 6, 1936, cut off the revenue of nearly $1,000,000,000 accruing from the processing tax, which was relied on to compensate the farmers for curtailing their production of wheat, cotton, tobacco and hogs. Then, three days later, congress, by an overwhelming vote, passed over the president's veto the bonus bill, which provided for the immediate payment to World War I veterans of their adjusted compensation certificates, due in 1945. Eight months earlier (May 22, 1935) the president had appeared before congress to read in person his veto of a similar bill, and had been able to prevent the senate (by a vote of 54 to 40) from overriding his veto. But this time both houses repassed the bill immediately, and the treasury found itself obligated to the payment of more than $2,000,000,000. The veterans were paid on June 15, 1936, in

Summary of Presidential Elections in the United States, 1860-1932

(Successful candidate in boldfaced type; unsuccessful, in lightface type Candidates receiving no electoral vote are not mentioned)

Year	Candidate	Party	Popular Vote	Electoral Vote
1860	**Lincoln**	Republican	1,866,452	180
	Douglas	Democrat	1,375,157	12

*Greeley died before electoral vote was cast

ten-year 3% bonds of $50 each which they might turn into cash at will at any one of the 300 main post offices of the country

The result of these outlays, both anticipated and unforeseen, was to raise the national debt at the end of the fiscal year 1935–36 to more than $34,500,000,000, or double the amount of the debt at the beginning of the Hoover administration. Republicans asserted that such pyramiding of the debt would endanger the credit of the government, and deplored the burden of taxation that its servicing would entail upon future generations.

But the administration leaders replied that the government was able to borrow all the money that it needed at the lowest interest rates in U.S history and that the debt was much lower per capita than those of the leading European states.

The National Conventions of 1936.—On June 9, 1936, the Republicans met at Cleveland, O., to write their platform and select their candidates for the presidential campaign. The platform condemned the Roosevelt administration for its regimentation of business, its contempt for the constitution, its waste of the taxpayers' money, its flouting of the civil service regulations, its encouragement of class hatred and its march toward a dictatorship in concentrating unprecedented power in the hands of the executive. It recommended turning the administration of relief over to the states, with subsidies from the national government, pledged efficient aid to the farmer and the labourer, advocated the restoration of a stable currency and promised to balance the national budget without either neglecting the worthy poor or increasing taxes. For several weeks the tide of popular favour had been setting strongly toward Gov Alfred M. Landon of Kansas as the Republican nominee. On the first ballot he received all the votes of the convention except those of 18 delegates from Wisconsin and 1 from West Virginia who voted for Sen William Edgar Borah of Idaho. Col. Frank Knox, owner of the *Chicago Daily News* and, like Landon, a follower of Theodore Roosevelt in 1912, was unanimously named for the vice-presidency. On June 23 (two days after the end of the 74th congress) the Democrats held their convention at Philadelphia, Pa., and renominated Roosevelt and Garner by acclamation. The president, in his acceptance speech, stood pat on his program of relief, recovery and reform, scored the "economic royalists," and pledged himself to the necessary readaptation of social and economic life within the bounds of the constitution. The Socialists nominated Norman Thomas again; the Communists put up Earl Browder; and a new party appeared under the title of the Union for Social Justice, sponsored by Father Charles E. Coughlin of Detroit, F. E. Townsend, and the political heirs of Sen. Huey P. Long, nominating as its candidate Rep. William Lemke of North Dakota.

The Campaign of 1936.—The main issue, of course, was the approval or disapproval of the New Deal. The Republicans were hampered by the fact that their representatives and senators in congress had voted for many of the administration measures and by the anomalous position of Governor Landon, who condemned the New Deal and at the same time promised to continue the program of relief and recovery A split in the Democratic ranks had been threatened when prominent members of the party, calling themselves "Jeffersonian Democrats," led the formation of the Liberty league. Alfred E. Smith and former Secretary of State Bainbridge Colby accused President Roosevelt of having repudiated the party platform of 1932. It was believed that the opposition of these dissidents, added to that of the Coughlin-Lemke party, the long existing campaign of the utility companies against the TVA and the hostility of conservatives to deficit financing and to extensive control of business would so far reduce President Roosevelt's strength as to make his victory in any case a narrow one. Indeed a *Literary Digest* poll gave Landon a popular lead of 1,293,669 to 972,897 and predicted a Landon victory of 370 to 161 in the electoral college But the vote on Nov. 3 registered an overwhelming victory for Roosevelt. He carried 46 of the 48 states (all except Maine and Vermont), with 523 electoral votes to 8 for Landon. His popular plurality over the Republicans in a vote of 45,647,117 exceeded 11,000,000. The various minor parties polled 1,490,861 votes combined, of which Lemke (Union party) had 882,479. The Republicans elected governors in only three states (Vermont, New Hampshire and South Dakota) in which gubernatorial contests were held. The Democrats gained a dozen seats in the house and five in the senate. It was a complete endorsement of President Roosevelt and the New Deal, won despite almost complete opposition of the press

Foreign Affairs.—Absorbed in his program of relief and recovery at home, President Roosevelt had paid comparatively little attention to foreign matters. The questions of the Allies' debt to the United States and of limitation of armament were not pushed. The tariff and international trade got little attention. In Nov. 1933, the government recognized the U S.S.R., sending William C. Bullitt as the first ambassador to that country since the overthrow of the tsar's regime. The government participated in the seventh Pan-American congress at Montevideo, Urug., in the same autumn, with Sec. Cordell Hull again leading the delegation. By the McDuffie-Tydings act of 1934 the United States gave independence (to be final in ten years) to the Philippine Islands and in 1935 Manuel Quezon was elected first president of the

Commonwealth of the Philippines; and the United States at last freed Cuba from what the islanders considered an embarrassing dependence, by abrogation of the Platt amendment (May 1934). On June 12, 1934, the president signed a Reciprocal Tariff act, under which Secretary of State Hull negotiated 24 reciprocity agreements with foreign nations, which at once resulted in an increase in U.S. foreign trade. What was thought to be a guarantee of the preservation of U.S. neutrality in the event of another European war was provided by the Neutrality act of April 1935, forbidding Americans to furnish munitions or money to foreign belligerents and refusing protection to Americans sailing on belligerent ships

But the launching of an attack on Ethiopia by Italy in the autumn of 1935, the steady encroachment of Japan on the territorial integrity of China and the outbreak, in July 1936 of civil war in Spain brought the problem of U.S neutrality into sharp relief. While temporary neutrality legislation was passed in 1935 and 1936, the arguments continued in congress and the country between the advocates of a mandatory law, leaving no discretion to the president in case of the outbreak of war, and a flexible law, permitting the president to handle each case as it should arise.

The outcome was the War Policy act of May 1, 1937, which embodied a compromise. The mandatory provisions of an embargo on arms and ammunition, the prohibition of loans to belligerents and the refusal to allow Americans to travel on ships of the belligerents were retained; but the president was granted the all-important power of determining whether the law was to be put into effect by proclamation that a war actually existed, and was allowed wide discretion in other respects.

The President and Congress.—President Roosevelt was inaugurated for his second term on Jan. 20, 1937, in accordance with the 20th amendment to the constitution. The first session of the 75th congress, which assembled on Jan 3, contained enormous Democratic majorities (334 to 105 in the house and 76 to 20 in the senate) which had been returned in the party's victory in the election of 1936. Interpreting the victory as an endorsement of the New Deal, the president announced in his inaugural address that he had "just begun to fight" for his program, and in his message to congress he asked that "action now" be taken on proposed measures for the regulation of hours and wages, the relief of farm tenants, the extension of social security, the control of speculation, federal health insurance and a housing program for the elimination of slums. The president also wanted legislation for a more effective crop control, for the creation of six great regional projects like the TVA and for authorization to reorganize the agencies of public works, relief and loans according to his discretion. But the congress proved to be unwieldy and unmanageable Factions developed, and adjournment came on Aug. 21, 1937, without the enactment of any of the major measures.

The "Recession" of 1937.—A sharp decline in prosperity set in during the latter half of the year. In midsummer the production index stood higher than it had in a decade. The first quarter's output of steel had exceeded by 600,000 tons the previous high record of 1929. The national income had risen from less than $40,000,000,000 in 1932 to nearly $70,000,000,000. Then there began a decline which sent the business index down from 111.2 in August to 88.9 in November. Steel production fell from 80% to 31% of capacity. The average price of 50 stocks fell from 135 5 to 82; relief rolls swelled and the number of unemployed rose to about 10,000,000. The president called an extra session of congress on Nov. 15 to try again to get through some of the measures which he had proposed at the beginning of the year. But the session adjourned six weeks later without accomplishing any more than its predecessor had done.

The Supreme Court Issue.—Still further friction between the president and congress developed when Roosevelt proposed the addition of six new justices to the supreme court (with the purpose of inducing the six actual members more than 70 years of age to resign), and advocated a similar "infusion of new blood" into the lower federal courts. The latter proposition did not arouse much interest, but the so-called attempt to "pack" the supreme court with men who would uphold the legislation of the New Deal met with immediate opposition The court had nullified nine of the measures of the New Deal, including such important ones as the NRA and the AAA; and on the occasion of the NRA unanimous decision in May 1935 the president had commented impatiently on the judges who were still living in the "horse and buggy days." During the entire four years of his first term President Roosevelt had had no opportunity to make an appointment to the supreme court, whereas, President Taft, for example, had six vacancies to fill in his single term. The controversy over the court reform occupied much of the attention of congress during the spring and early summer, until the president gave up the struggle when the senate, by a vote of 70 to 22, defeated the reorganization plan on July 22. Meanwhile the court had receded somewhat from its hostility to "progressive" measures. On March 29 it upheld the Washington Minimum Wage law for women. On April 12 it sanctioned the Wagner Labor Relations act. On May 27 it held the Social Security act of 1935 constitutional. The decision in practically all these cases was by a five to four vote. Justices James McReynolds, George Sutherland, Pierce Butler and Willis Van Devanter taking the negative and Chief Justice Hughes and Stone, Brandeis, Owen J. Roberts and Cardozo the affirmative.

Rapid changes in the personnel of the court from the summer of 1937 on gave the president the opportunity to create a "liberal" tribunal without resorting to innovating proposals On June 2 Justice Van Devanter, taking advantage of the law permitting retirement at the age of 70, left the court, and was replaced by Sen. Hugo Black of Alabama, a staunch advocate of the New Deal. In 1938 Justice Sutherland of Utah, another conservative, resigned, to be succeeded by Roosevelt's solicitor general, Stanley Reed of Kentucky. Justice Cardozo died the same year, and Felix Frankfurter of the Harvard law school was appointed in his stead. In 1939 the aged Justice Brandeis, an appointee of Woodrow Wilson in 1916, left the bench and the president appointed William O. Douglas of Connecticut to succeed him. Justice Butler of Minnesota, a consistent conservative, died in 1939, and was replaced by the former governor of Michigan and of the Philippines, Atty Gen. Frank Murphy. In 1941 Justice McReynolds, the most conservative member of the court, resigned, to give place to Sen. James F. Byrnes of South Carolina. Finally, in 1941 Chief Justice Hughes resigned after 11 years of service. The president promoted the Coolidge appointee Harlan F. Stone to the chief justiceship, and named Robert H. Jackson of New York (who had taken Murphy's place as attorney general) to fill the vacancy. So by 1942 every member of the court except Chief Justice Stone and Justice Roberts was an appointee of President Roosevelt.

The Labour Struggle.—The year 1937 saw the fiercest conflict in the field of labour since the demoralizing period immediately following World War I. The battle started late in 1935 with the formation, by John L. Lewis, president of the United Mine Workers of America, of the Committee for Industrial Organization (later changed to the Congress of Industrial Organizations) to supplant the craft unions of the A.F. of L. by industrial or "vertical" unions comprising all the workers in a given industry, something on the pattern of the "one big union" advocated by the Industrial Workers of the World (I.W.W.) a generation earlier. The new weapon used by the C.I.O. in its bitter fights with automobile and steel industries was the "sit-down strike" in which the strikers intrenched themselves in the factories and refused to work or to let others in to work. Although this trespassing was an infringement on property rights, Gov. Frank Murphy of Michigan refused to evict the strikers by force, lest bloodshed should ensue. President Roosevelt declined to take part in the struggle, crying "a plague on both your houses." Secretary of Labor Perkins at first took a complacent view of the matter, saying that the legality of the sit-down strike had not been determined; but later she condemned the movement. It petered out after a few months, but the C.I.O. grew rapidly, until by midsummer of 1937 it claimed to have drawn away more than half the members of the older organization. General Motors came to terms with the C.I.O. in March, and the major steel companies

followed suit Fully aware that the split in the ranks of labour was hurting the cause, the two presidents of the rival organizations tried in a series of conferences to come to some agreement. But neither William Green of the A F. of L. nor John L. Lewis of the C.I.O would yield a point, in spite of the pleas of some of their important lieutenants for harmony. It was hoped that the National Labor Relations board (NLRB), set up under the Wagner-Connery act of July 1935, would serve to iron out disputes in the industrial field, as the Railway Labor board in 1926 had averted serious strikes on the railroads, and, indeed, up to the close of the year 1938, the NLRB did handle more than 10,000 cases involving approximately 2,000,000 workers with fair success. It provided protection to workers in interstate commerce industries, in the formation of associations to elect their own representatives to conduct collective bargaining with the employers, and forbade the latter to interfere with labour organizations or to refuse to bargain collectively. The board might issue "cease and desist" orders, subject to judicial review, to prevent employers from violating the act However, the board encountered opposition from the beginning The A F of L. complained that it constantly favoured the C I.O. in its rulings and demanded its revision. The employers protested against its unfairness in allowing appeals from the workers only Although the NLRA was declared constitutional by the supreme court in April 1937, the effort to have it amended or repealed was continuous. Between Jan. and Aug. 1937 more than 3,200 strikes affecting 1,470,000 workers were reported by the bureau of labour statistics To be sure, the number of strikes decreased in the next two years, averaging 231 a month in 1938 and 192 a month in the first seven months of 1939, as against 395 a month in the year 1937 But still the hostility of the two great labour organizations to each other and of both to the NLRB continued, in spite of the president's sporadic efforts to bring peace in the labour ranks. A concession was made to industry in July 1939, when employers were given the right to call for an election to determine the proper body for collective bargaining. Also the supreme court by a six to two decision reversed a decision of the board which had ordered the Fansteel Metallurgical company to rehire the men discharged in the sit-down strike of 1937.

The outbreak of World War II in Sept. 1939 invested the labour controversy in the United States with more than a domestic significance Following labour-management conferences, a new policy was adopted early in 1942, proscribing strikes and lockouts for the duration of the war, and in place of the NDMB the president appointed a War Labor board of 12 men (4 labour leaders, 4 industrialists and 4 members of the public) with William H Davis as chairman. Lewis (who had resigned the presidency of the C.I O. after turning against Roosevelt and threatening to resign if the latter were re-elected) then proposed a united front in labour: both President Green of the A.F of L. and Pres Philip Murray of the C.I O should resign, and George Meany should become president of the merged organization, with Lewis as vice-president. But neither Green nor Murray (who was not consulted) favoured the suggestion; nor did President Roosevelt.

Political Rivalry.—When the president met the final session of the 75th congress on Jan. 3, 1938, he asked for legislation on farm relief and on wages and hours in industry. He disclaimed any hostility to business in general, but accused a minority of big businessmen of antisocial practices in tax evasion, unfair competition and the maintenance of high prices As contrasted with the "do nothing" sessions of 1937, congress passed two acts of major importance. On Feb. 14 came the elaborate Crop Control act of 1938 which had for its purpose what Secretary Wallace called the "ever normal granary," that is, the maintenance of a fairly steady ratio between the production and consumption of the chief surplus crops of the United States: wheat, corn, cotton, tobacco and rice. The government was to store the surplus in fat years and release it in lean years, extending loans of the stored surpluses through the Commodity Credit corporation. A novel feature of the act was the provision for a referendum among the raisers of the crops in question to determine whether or not they agreed to the quotas of production which were fixed by the Agricultural administration.

In June 1938 congress passed a Fair Labor Standards act (or Wages and Hours act) for industries entering into interstate commerce The act was designed to "put a floor under wages and a ceiling above prices" Wages were to increase from a minimum of 25 to 40 cents an hour, and hours to decrease by the same sliding scale from a maximum of 44 to 40 a week But in spite of these major measures, opposition to the president's program went on. A combination of Republicans and anti-New Deal Democrats slashed hundreds of millions from appropriation bills, defeated the reorganization of the executive departments, refused to amend the Neutrality act, ignored the request for the establishment of six regional projects like the TVA and so amended the tax bill of 1938 in favour of the corporations that the president allowed it to become a law without his signature

As the head of his party the president deemed it proper to intervene in the primaries of 1938 by letters, conferences and speeches, to eliminate certain discordant Democrats (notably Sen Millard Tydings of Maryland, Ellison Smith of South Carolina, Walter George of Georgia and Guy Gillette of Iowa and Rep John O'Connor of New York) from congress. This course, taken against the advice of Chairman James Farley, proved to be a boomerang All the senators attacked were easily renominated and re-elected, while two prominent New Deal senators (James Pope of Idaho and William McAdoo of California) were defeated. Farley had predicted that the Republicans might gain 40 seats for the 76th congress, but they actually increased their numbers from 89 to 170 in the house, and gained 8 seats in the senate. They elected 11 governors, and outside the "solid south" polled 51.5% of the popular vote, as compared with 40 1% in the election of 1936.

WORLD WAR II

The Problem of Neutrality.—The outbreak of war in Europe with Adolf Hitler's invasion of Poland on Sept. 1, 1939, and the immediate declaration of war on Germany by Great Britain and France brought a decided change in the policy of the administration and in the attitude of the public Since his inauguration in 1933 the president had subordinated questions of foreign policy to his battle for the reforms of the New Deal. During the first session of the 76th congress (Jan 3–Aug. 5, 1939) he was still labouring with the most recalcitrant congress of all his six years to secure additional appropriations for housing, to have the provisions of the Social Security act of 1935 liberalized, to maintain in vigour the undistributed profits and capital gains taxes, to get $2,800,000,000 appropriated for his "spending-and-lending" plan and to persuade congress to amend its neutrality legislation so as to leave him a free hand in dealing with foreign aggressors in the time-honoured way of *ad hoc* diplomacy.

To meet the overwhelming desire of the American people to keep out of war, congress passed a joint resolution on Aug 24, 1935, providing the most sweeping neutrality legislation in U.S history By the act of May 1, 1937, the shipment of arms and ammunition and the extension of loans and credits to any belligerent were forbidden. All purchases of nonmilitary supplies made in the United States must be paid for "on the barrelhead" and carried away in non-U.S. ships (the cash and carry provision); and Americans were forbidden to travel on merchant ships of a country at war. The president was empowered to declare when a war existed between foreign nations and to embargo other exports besides munitions and arms It was proclaimed at once by the president in the case of the Spanish Civil War.

Having no discretion to discriminate between "aggressor" and "nonaggressor" belligerents, the president asked congress to rescind the mandatory provisions of the act, but on July 11, 1939, the senate committee on foreign relations refused by a vote of 12 to 11 to consider any changes in the law during that session of congress. Seven weeks later the war in Europe came. Roosevelt, eager to keep the United States out of war but convinced that the only way to do so eventually was to give all aid possible to France and Great Britain, called congress in extra session on Sept 21, 1939, for the purpose of amending the neutrality provisions of the legislation of 1937.

He would keep the cash and carry provision and the denial of war credits to belligerent nations. He would even approve barring U.S merchant ships from combat areas But he pleaded that the embargo on arms be lifted

After a spirited debate the senate, on Oct. 27, repealed the embargo by a vote of 63 to 30, and the house concurred on Nov 2. An amendment of Senator La Follette (reviving the Ludlow amendment of two years before), providing for a popular referendum on the declaration of war, was rejected by a vote of 17 to 73.

The following year saw the rapid German conquests of Denmark, Norway, Belgium, the Netherlands and France. Roosevelt was certain that only "all-out" aid to the democracies could save the United States.

In Sept. 1940 he transferred 50 overaged destroyers to Great Britain in exchange for leases for naval bases at eight points on the Atlantic coast from Newfoundland to British Guiana. He told the new session of the 77th congress in Jan 1941 that the U S must become the "arsenal of democracy." A few days after it had assembled the house received a bill numbered 1776, calling for the supply to the enemies of Hitler of every sort of material to help them win the war In spite of opposition by the noninterventionists in congress and out, the Lend-Lease bill was passed in March, and was followed immediately by an appropriation of $7,000,000,000 (later increased by another $6,000,000,000) for its implementation. The Lend-Lease act was a virtual declaration of war against the totalitarian powers and the abandonment of neutrality. It needed only the increasing sinkings of U.S. merchant ships and destroyers by German submarines during the summer and autumn of 1941 to lead congress to obliterate the last remnants of the neutrality legislation and permit U.S. ships to sail with unrestricted cargoes to any part of the world.

The *Election of 1940*.—Meantime the quadrennial election year had come and gone. Despite the fact that the limit of two terms for the presidency seemed to be firmly established by the example of Washington and Jefferson, and that congress had twice (1875 and 1928) passed a resolution that a third term would be "fraught with danger to our republican institutions," the critical situation in 1940 led most of the Democratic leaders to insist that Roosevelt should run for a third term. The president himself made no move to secure or refuse the nomination and was unanimously nominated on the first ballot at Chicago in mid-July Secretary of Agriculture Henry A. Wallace was named as his running mate. The chief Republican aspirants were Sen Robert A. Taft of Ohio and Sen Arthur Vandenberg of Michigan, and District Attorney Thomas E. Dewey of New York, who had nearly defeated Governor Lehman two years before The Republican convention at Philadelphia, however, responded to a widely supported movement for Wendell Willkie, president of the Commonwealth and Southern utilities corporation and nominated him on the sixth ballot, with Sen. Charles L. McNary of Oregon for the vice-presidency.

Willkie aroused great enthusiasm by a vigorous and forthright campaign, but his case was weakened by the fact that he had had no experience in political life He polled 22,305,198 votes to Roosevelt's 27,244,160 in the election of Nov. 5, but carried only 10 states with 82 electoral votes, to 449 for his opponent. The election made little change in the new (77th) congress, the Democrats gaining 7 seats in the house and the Republicans 8 in the senate. The vote for the minor parties (Socialist, Communist and Prohibition) was insignificant.

National Defense.—The problems of national defense absorbed the attention of the administration increasingly during 1940 and 1941, affecting not only the policies of the army and the navy, but also the whole field of production, transportation, labour, finance and education. On May 28, 1940, as France was succumbing to the drive of the German armies, President Roosevelt set up an advisory Council of National Defense, patterned on Wilson's council of 1916, with six cabinet members and seven expert industrial advisers, headed by William S. Knudsen, president of General Motors. Seven months later, as defense preparations were lagging, a "supercommission" of four was created, called the Office of Production Management (OPM). Knudsen retained the chairmanship and Sidney Hillman, president of the Amalgamated Clothing Workers, was a kind of cochairman, representing the interests of labour Secretary of War Henry Stimson and Secretary of the Navy Frank Knox were the other two members. President Wilson's council had been converted early in 1918 to a virtual dictatorship over industry by Bernard M. Baruch; but Roosevelt refused at first to appoint a "defense tsar," declaring that the business of arming the United States was "too large and complex a job for any one man." Conflicts of authority and policy within the board, difficulties attending the conversion of manufacturing plants for the production of war materials and the constant setbacks caused by strikes caused the president to give way, however, and after the United States formally entered the war he appointed Donald M Nelson, formerly of Sears, Roebuck and company, as the head of a new War Production board (WPB) in Jan. 1942, with powers exceeding even those of Baruch in 1918 Nelson was authorized to overrule the army, the navy and all other departments of government in matters of production. He could take over plants, open new plants, hire and fire workers and commandeer materials. He was subject to the president alone in his orders.

The most controverted measure of the U.S. defense program was the conscription of American youth. A Gallup poll taken just after Munich showed only 37% in favour of military training, but when Hitler took Paris in June 1940 the figure rose to 64%. The Burke-Wadsworth Selective Service and Training bill was introduced into congress, providing for the registration of men between the ages of 21 and 35, no more than 900,000 to be called into service at any one time during peace. The act was to expire on May 15, 1945. The opposition was strong, but the bill passed by majorities of about two to one and was signed by the president in September. Clarence A. Dykstra was made administrator of the draft. The drawing of numbers began on Oct 29, the same glass bowl being used that had served for the Selective Service act of 1917 So for the first time when the nation was not actually at war the government resorted to compulsory military service. When war became imminent, registration was extended up to men of 64 (those between 19 and 44 being liable for active service), and restrictions as to the length and place of service were removed.

Latin-American Relations.—The Roosevelt administration from the beginning was intent on the substitution of the "good neighbour" policy for the "big brother" policy in U.S. relations with the republics south of the Rio Grande. As an earnest of this policy the last of the U S. marines were withdrawn from Haiti and the Platt amendment to the constitution of Cuba (giving the United States the right of intervention) was abrogated in 1934 Pacts of reciprocal trade were negotiated by Secretary Hull, and in the Pan American conferences held at Montevideo, Urug. (1933), Buenos Aires, Arg. (1936), and Lima, Peru (1938) the delegations from the United States stressed the solidarity and the political equality of all the American republics. Relations with Mexico were strained when Pres. Lázaro Cárdenas, in March 1938, seized the oil properties of British and U.S. firms in Mexico.

After World War II broke out the Latin-American republics were inclined to closer relations with the United States, both because of the penetration of axis propaganda and because the League of Nations, of which most of the Latin-American countries were originally members, showed itself in the cases of China, Ethiopia, Austria and Czechoslovakia impotent to protect the weaker nations. At the conference of Panamá, in Oct. 1939, they took a long step toward hemispheric defense in agreeing to pool their navies to patrol the 6,000 mi. of the eastern coast of South America from the mouth of the Amazon to Cape Horn; and at Havana, Cuba, the next July, they adopted the policy announced by the United States of not recognizing the transfer of any region of the western hemisphere from one non-American power to another and agreed to consult for the protection of any of the republics which should be threatened by the subversive actions of fifth columnists. Trade pacts, large money loans, exchanges of students, delegations of professional and business men and the

various activities of Nelson A. Rockefeller's committee for the cultivation of cultural and commercial relations between the American republics all helped to bring the Latin-American peoples closer to the United States When the United States went to war with the axis powers in Dec 1941, nine of the Latin-American countries (including all the Central-American republics) promptly followed by either breaking off relations with them or declaring war.

Foreign Relations.—*Germany.*—In the middle of April 1939, after Hitler had entered Prague and Mussolini had seized Albania, President Roosevelt sent a message to both leaders, asking them to agree for a period of ten years not to attack any of 31 weaker nations which he listed, promising to secure like guarantees of nonaggression from those nations. Mussolini took no notice of the request, but Hitler refused some days later in an address to the *reichstag* Again, late in August, when Hitler was on the point of invading Poland, the president made another futile attempt to avert a general European war through mediation or conciliation. When the war came on Sept. 3 the sympathy of the United States with the cause of the Allies was unmistakable; and after Hitler's rapid conquest of Denmark, Norway, the Low Countries and France, and his air assaults on Great Britain, that sympathy was changed into active co-operation with Britain in the face of the common nazi danger The transfer of the 50 destroyers to Britain, the repeal of neutrality, the aid given in the Lend-Lease act, occupation of the Danish islands of Greenland and Iceland as lying in waters "necessary for the defense of the United States" and the patrol of North Atlantic waters by U S destroyers were in effect a declaration of war against Germany, and the Germans did not hesitate to retaliate During 1941 they sank U.S.-owned merchant vessels and launched torpedoes at three U.S. destroyers, missing the "Greer," severely damaging the "Kearny" and sinking the "Reuben James." President Roosevelt did not ask congress for a declaration of war, but on Sept. 11 he gave orders to naval vessels protecting lines of commerce to "shoot at sight" on any hostile craft It was not until the Japanese attack on Pearl Harbor on Dec 7 that the president asked congress to declare war formally on Germany and Italy, which it did in both houses.

Great Britain.—The ties between the British Commonwealth and the United States meanwhile became stronger Prime Minister Winston Churchill and President Roosevelt met on a battleship in the Atlantic ocean on Aug. 14, 1941, and drew up the Atlantic charter of eight points, somewhat similar to the first five of Wilson's fourteen points of 1918, outlining the nature of the peace to follow the Allied victory. Later Churchill visited the United States and spent the Christmas season at Washington in conference with the president. He received an ovation when he addressed the joint session of congress

As a result of the conferences a union of nations originally comprising 26 countries, was formed early in 1942, and plans were made for the joint conduct of the war against the totalitarian powers.

Japan.—In the far east the constant encroachments of Japan on the territory of China since her seizure of Manchuria in 1931 became a source of friction between Tokyo and Washington. Accused of breaking article xvi of the League covenant, Japan withdrew from the League of Nations in 1933. Her adherence to the Anti-Comintern pact in 1936 increased her hostility to the western powers. In 1937 war between Japan and China broke out. The sinking of the U.S. gunboat "Panay" on the Yangtze river by a Japanese bomb on Dec. 12, 1937, brought an apology and an indemnity from the Tokyo government; but no pledge of the abandonment of the Japanese policy to create "a new order" in China. On Jan. 26, 1940, the United States abrogated its commercial treaty of 1911 with Japan; but still the United States continued to sell to Japan more than half of the material Japan was using in its war against China. When the Japanese armies invaded French Indochina in Sept. 1940, with the apparent purpose of establishing bases for an attack on the East Indies (the source of many products indispensable to the United States, like rubber, tin, tungsten, hemp, jute and various vegetable oils), the U S put an embargo on scrap iron and steel to Japan; and Japan replied by signing a triple alliance with Germany and Italy (Sept 27) The alliance was evidently aimed at the United States, and Japanese Foreign Minister Yosuke Matsuoka, though asserting that his country wished to preserve peace with the United States, acknowledged that if the axis powers should become involved in war with the United States Japan would be in duty bound to join them. As the year 1941 progressed the Japanese encroachments continued Secretary Hull told Ambassador Adm. Kichisaburo Nomura that "a showdown" would have to come. In November a special envoy, Saburo Kurusu, was sent from Tokyo to join Nomura in negotiations with the president and Secretary Hull.

But even as the conferences were proceeding, Japanese planes descended on Pearl Harbor, Hawaii, on Sunday morning, Dec 7, destroyed two American battleships and five other war vessels, wrought havoc with grounded planes and inflicted about 2,000 casualties. Simultaneous attacks were made on the Philippines (Manila falling at the beginning of Jan 1942), Wake and Guam. On Dec. 8 congress declared war on Japan with only a single dissenting vote (For the military events of the war, *see* WORLD WAR II) (D. S. MU.; E. E. R.)

Election of 1944.—Once before in national history a presidential election had been held while the issue of war was in the balance. As in 1864 so in 1944 there was no thought on the part of responsible leaders that the election would not be held. Indeed, there were men who felt a greater need because of the fourth-term candidacy of President Roosevelt, which was finally accepted by the Democratic party in July. Prior to that nomination the president had made clear his program for peace as well as war in his messages to the congress. He pointed out that the costs of war, so far, had been six times the costs of World War I He estimated that the actual war cost would exceed $200,000,000,000 by the middle of the year. At the same time looking to the future, he called for a "five-point plan," which dealt with the days of peace to follow the war. He envisaged a vast government spending plan, and a new eight-point "bill of rights." These were to include the right to a job; to earn money for adequate food, clothing and recreation, for farmers there was to be a decent living, for businessmen freedom from unfair competitions; there was to be protection for all in old age, during sickness and unemployment; and provision should be made for an education for all.

In mid-February the congress passed a tax bill which, although approved by both administration and legislative party leaders, did not meet the plans of the president. His veto message caused a violent outburst in the press and among his own party supporters. The bill was passed over his veto by overwhelming majorities.

The year was marked by violent labour disputes, and long-drawn-out controversy between the president and his representatives on the one hand, and the representatives of organized labour (in particular musicians and coal miners) and of business on the other. Each added some uncertainty to a wartime election.

In their national convention held at Chicago June 26–28, the Republicans nominated Gov. Thomas E. Dewey of New York, and as vice-presidential candidate, Gov. John W. Bricker of Ohio As had been expected for some months, the Democratic convention meeting in Chicago July 19–21 nominated Roosevelt for the fourth term, and instead of renominating Vice-Pres. Henry A. Wallace, chose Sen. Harry S. Truman of Missouri.

Labour took an unusually active part in the canvass. Not only had the Political Action committee (P.A.C.) and Congress of Industrial Organizations (C.I.O.) been active in the preliminary campaign for Wallace as vice-presidential candidate, but in October Philip Murray of the C.I.O. and Sidney Hillman of the P.A.C. issued statements calling on labour to support the Democratic ticket.

There had been an early discussion of the "soldier vote," estimated at nearly 10,000,000. Various devices were used to poll it, but it did not change the final result. The result of the November election was decisive. Roosevelt polled 25,602,504 votes to

22,006,285 for Dewey. Only 367,474, or less than 1%, were cast for other parties It was notable that although the electoral majority was overwhelming (432–99), the minority vote was not only great (45 9% of the total vote), but spread over two-thirds of the country. Congress remained in the possession of the Democrats. (E. E. R.)

AFTER WORLD WAR II

End of the War.—First in importance in 1945 were of course the events that brought the end of the war. On May 7 all forces of Germany were unconditionally surrendered. On Aug. 6 an atomic bomb was dropped on Hiroshima, and on Aug. 9 one on Nagasaki. On Aug 10 the Japanese government agreed to unconditional surrender. On Sept. 2, on the battleship "Missouri" in Tokyo harbour the surrender was signed. As at the conclusion of World War I the armed forces abroad, except those assigned to occupation in Germany and Japan, were speedily returned home.

President Truman.—Upon the death of President Roosevelt (April 12, 1945) scarcely three months after his inaugural for the fourth term, Truman became president. The problems he faced were known to him only in a general way, for he had not had close association with the administration. First of all were the problems of the war; but second only in importance to the actual realization of the results of the war was the problem of inter-Allied co-operation. These were dramatically presented to the world by conferences with the Russian and British leaders at Yalta and Potsdam The problem of world peace was emphasized by the San Francisco conference, which produced the charter of the United Nations (*q.v.*). The domestic problems that pressed upon President Truman at once had to do most of all with the demands of labour and the danger of inflation following the removal of controls and early steps to return to a peace economy. The 79th congress, however, passed few of the president's major recommendations, since a number of southern Democrats who were opposed to the continuance of New Deal policies had joined with the Republican minority to form an opposition bloc. Moreover, there was disagreement among top administration men on issues such as price control, labour legislation and subsidies.

The United Nations.—On April 18, 1946, the League of Nations ceased to exist. The early moves of the United Nations did not promise an easy course; there were exciting disagreements as to forms and procedures, and in particular as to the location of headquarters. Various sites within the United States were considered by a U.N. committee, and final decision was deferred for some time. But the Security council met at New York city and on Oct. 23 the general assembly meeting at temporary headquarters was opened by President Truman. By the end of the year the question of the veto power had become the leading problem, not only of discussion but also of procedure, because of the attitude of the Soviet Union.

The 80th Congress.—The congressional elections of 1946 were of unusual interest because of the fact that Truman's leadership had never been tested, and because of the shifts in domestic policies following the close of the war which had given a new impetus to both political parties, as yet untested at the polls. There was greater interest than in 1942, evidenced by a vote greater by nearly 7,000,000. The Republicans carried 30 states, and gained control of both houses of congress. It was the first time in 16 years that the Republicans had control of both houses and the first time since Woodrow Wilson's second administration that the president and the majorities in congress were of opposite parties.

On June 16, 1947, Truman vetoed a bill to reduce taxes. The 80th congress passed the Taft-Hartley bill of 1947 over his veto by votes of 320 to 79 in the house and 54 to 17 in the senate. It forbade the closed shop and secondary boycott, authorized injunction proceedings in certain cases and generally held labour unions responsible for complying with the regulations which business had to observe in its financial operations. A controversial part of the act proved to be the section requiring officers of unions to file affidavits disclaiming any connection with communism. The question was whether the regulation applied to the heads of the unions. The C.I.O. was bitterly opposed to the requirement, but William Green of the A.F. of L., who also opposed the law, was inclined to accept that provision. John L. Lewis then withdrew his 600,000 United Mine Workers from the A.F. of L., which they had rejoined a few months before. Other measures passed in 1947 included the ratification of peace treaties with Italy, Hungary, Rumania and Bulgaria; a constitutional amendment limiting the presidency to two terms (ratified in Feb. 1951 as the 22nd amendment), a law fixing the presidential succession (the speaker of the house and then the president pro tem of the senate); an act merging the armed forces into a single department of defense; and a $400,000,000 appropriation to implement the "Truman doctrine," a proposal to combat Communist influences in Greece and Turkey.

A major episode in the continuing "cold war" with the Soviet Union occurred during 1948–49, when the Russians blockaded the Allied sectors of Berlin. The U.S. and Great Britain were, nevertheless, able to maintain a successful airlift for the delivery of food and supplies. The blockade was officially ended on May 12, 1949, but the airlift was continued until Sept. 30.

In April 1948 congress voted an initial grant of $5,300,000,000 for the European Recovery program, a plan for economic aid proposed by Secretary of State George Marshall in June 1947. An Economic Cooperation administration was created and Paul G. Hoffman became the director.

Election of 1948.—The election of 1948 was marked by unusual features from the outset. A considerable portion of the party organization was opposed to the nomination of Truman, some because of disagreement with his policies, both domestic and foreign, and many because of a conviction that his defeat was a foregone conclusion. Many of those differing with the policy in foreign affairs, particularly with the utterances of the administration in the political conflict with the U.S.S.R., united in supporting an independent movement, and eventually presented Henry A. Wallace as a candidate on the platform of a newly formed Progressive party. The more extreme members of the Democratic party in a number of southern states left the Democratic convention after the adoption of a platform stressing civil rights and formed an independent party, the States' Rights Democrats (Dixiecrats), and nominated Gov. J. S. Thurmond of South Carolina for president.

Despite the seeming certainty of defeat because of these revolts, the Democratic convention nominated Truman with Alben W. Barkley as vice-presidential candidate, and called for repeal of the Taft-Hartley act restricting the scope of labour union activities.

The Republican party entered the campaign confident of success, and after a sharp contest in convention—most of all over personalities—united in supporting the ticket, Gov. Thomas E Dewey of New York for president, and Gov. Earl Warren of California for vice-president.

The campaign was listless, the Republican candidate on the whole agreeing with the Democratic program, except for calling for retention of the Taft-Hartley act and for a limitation upon the social-service activities of the federal government. President Truman campaigned actively and with unusual vigour. The methods and speeches of Truman was reminiscent of popular campaigns of Democratic candidates of the preceding 50 years. The result was unexpected by almost everyone except the president and his closest advisers. All public-opinion polls had indicated his defeat. Despite the fact that he lost four states because of States' Rights defection (1,169,021 votes) and that 1,156,103 votes presumably nearer Democratic than Republican, were cast for Wallace, Truman won 24,105,695 votes (303 electoral votes) to 21,969,170 for Dewey (189 electoral votes).

Second Administration of Truman.—Both houses were Democratic as they organized in Jan. 1949. The president called for a vigorous advancement of his Fair Deal program. A combination of Republicans with conservative Democrats, however, prevented action throughout the meeting of this congress. More and more Sen. Robert A. Taft of Ohio became the recognized leader of this opposition, as he had been in the previous congress.

Congress did ratify the North Atlantic treaty, and voted additional funds to the Economic Recovery program. Increased funds were voted for national defense, but proposals for higher taxes were defeated

The Taft-Hartley act was not repealed, nor was the civil rights program enacted The president's party was shown to be a minority in congress on critical domestic issues. In foreign affairs there was a continuation of bipartisan co-operation

In Jan. 1950 Truman announced that he had asked the U.S. atomic energy commission to produce a hydrogen bomb, which theoretically had the potential of being 1,000 times as powerful as an atomic bomb. In March of that year the first shipment of arms, in accordance with previous agreements, was sent to western Europe.

Long before the nominations for seats in the house and senate, it was evident that the campaign of 1950 would be fought at random, that issues would be confused, that personalities would be more than ever in the news As always, however, the call to support the program of the administration was much used by those Democrats who had upheld the Fair Deal in the sessions of the preceding two years. But in Maryland, Ohio, California and New York, and only to a less extent elsewhere, the campaign was fought most of all on the position of one or both candidates on questions growing out of labour demands and of "softness" toward Communists at home and abroad. Near the close of the campaign Truman denounced the program of his opponents in congress and called for endorsement of his program.

Democrats retained control of both houses, but by a greatly reduced margin in the house and by only one seat in the senate. This was generally interpreted as a Republican victory, in particular because of the triumphant victory of Senator Taft in Ohio, and in state contests the re-election of Governor Dewey in New York and Governor Warren in California.

On Dec. 16, 1950, Truman declared a national emergency and outlined plans for placing the U.S. on a war footing. In the same month Gen. Dwight D. Eisenhower was appointed supreme commander of a 12-nation force to be mobilized for the defense of western Europe

In the meantime, attention shifted to Korea, where, in late June 1950, forces of the Korean People's Republic, supported by soviet Russia, advanced south of the 38th parallel separating the northern Korean Communist state from the Republic of Korea, which had been established in 1948.

The issue was presented by the United States to the United Nations, where strong measures were advocated to suppress "aggression" in Korea. Led by the United States, the Security council (the Russian member not attending) voted for intervention by armed forces of the United Nations. Under the command of Gen. Douglas MacArthur, the campaign for the liberation of South Korea was brought to a successful conclusion. As the year ended, however, the issue of the conflict in North Korea was reversed, and the United Nations armies were forced into a costly and precarious retreat by overwhelming forces of the Chinese Communists, whose entrance into the struggle had been foreseen as a possibility but not expected.

The national situation of the United States, as the leader in an attempt to suppress aggression by Communist forces in the far east, became critical, and congress supported the president in a gigantic program for defense in the far east, in Europe and at home. (E. E. R.)

General MacArthur was relieved of his Allied, U.N. and U.S. commands by President Truman on April 11, 1951. He was succeeded in all commands by Lt. Gen. Matthew B. Ridgway, commander of the U.S. 8th army in Korea, who was later promoted to general. By May 31, 1951, U.N. forces had driven Communist armies back across the 38th parallel, and most of the ground lost to the Communists during their spring offensive had been retaken by the United Nations.

After an exchange of radio messages, General Ridgway and the Communist commanders, Gen. Kim Il Sung, of North Korea, and Gen. Peng Teh-huai, of China, agreed on July 5 to begin negotiations in the field for a cease fire. The chief negotiators, Vice-Adm Charles Turner Joy, U.S. navy commander in the far east, and Lt Gen. Nam Il, North Korean army chief of staff, began their talks on July 10 in Kaesong. In October the truce site was moved to Panmunjom Many months later, however, the negotiators still remained deadlocked (X)

The U S took the lead in concluding a peace treaty with Japan, which was signed in San Francisco, Calif , on Sept 8, 1951, by 49 nations, including Japan. Japan and the U S. agreed upon a bilateral security treaty which provided that U.S. troops could be stationed in Japan for an indefinite period, and the U S. also signed defense pacts with Australia and New Zealand In Oct. 1951 Truman signed the Mutual Security act, and appropriations alloting $7,300,000,000 in new funds and $817,000,000 in unexpended funds were provided for the foreign aid program. The E C.A., abolished on Dec. 31, 1951, was succeeded by the Mutual Security agency In April 1952 Eisenhower stated in his annual report that the free world was better able to defend itself than a year before On June 1, 1952, Eisenhower, who was increasingly mentioned as a possible candidate for the Republican presidential nomination, was relieved of his command at his request. Gen. Matthew B. Ridgway succeeded him

On April 8, 1952, Truman had ordered Charles Sawyer, secretary of commerce, to seize control of the nation's steel mills in order to avert a strike in the industry. But on June 2, 1952, the U S. supreme court held by a vote of six to three that the executive order was unconstitutional. Congress rejected requests to pass legislation authorizing the seizure and they were returned to private management.

On July 1, 1952, the senate ratified, by a vote of 77 to 5, a peace contract between western Germany and the western Allies.

Election of 1952.—While he was serving in western Europe, General Eisenhower had been entered in various Republican state primaries, a number of which he won by impressive margins After retiring from his post in western Europe on June 1, 1952, he campaigned actively for the nomination. Sen. Robert A. Taft was the other leading candidate, but Eisenhower was nominated at the national convention on the first ballot at Chicago, Ill , on July 11. Sen. Richard Nixon of California was named the Republican vice-presidential candidate. The Democratic national convention, which also met in Chicago, nominated Gov. Adlai E Stevenson of Illinois and Sen. John Sparkman of Alabama as the presidential and vice-presidential candidates.

Eisenhower vigorously attacked the Democratic administration, charging it with responsibility for the events leading up to the Korean war and for the scandals among top administrators in the internal revenue bureau, justice department and other government offices. Charges of communism in government were also made. Although both candidates had indicated their desire to restrict the campaign to the issues at question rather than personalities, vociferous charges were made by both parties President Truman conducted a "whistle-stop" tour, defending his administration and supporting Stevenson's candidacy.

In the November election, the popular vote of 61,547,861 was the largest in the nation's history. Eisenhower received 33,927,549 votes, which was several million more than the record of 27,751,597 set by Franklin D. Roosevelt in 1936. In a landslide in the electoral college, Eisenhower swept 39 states, with a total of 442 electoral votes, and Stevenson carried only 9, with 89 votes. Eisenhower shattered several political precedents and carried the southern states of Florida, Virginia, Tennessee and Texas The Republicans, who also gained control of the house, won a 48 to 47 margin in the senate, not including one independent Republican. (E E. R., X.)

Eisenhower's Administration.—The first months of the new administration were characterized by caution as Republican leaders studied domestic and foreign policies. Proposals for sweeping tax cuts and statehood for Alaska and Hawaii were postponed, but the controversial off-shore oil bill was signed. In July the signing of the Korean armistice provided a dramatic highlight. In his address to the nation Eisenhower noted that "We have won an armistice on a single battleground—not peace in the world. We may not now relax our guard nor cease our quest." (X.)

UNITED STATES COAST GUARD, THE: *see* COAST GUARD.

UNITED STATES COAST GUARD ACADEMY at New London, Conn , an institution of higher learning for the training of commissioned officers for the coast guard, was founded by act of congress in 1876, and embraces a four-year curriculum of liberal, theoretical and practical education.

Prior to the advent of World War II, the Coast Guard academy had a cadet corps of between 200 and 300 cadets, but in recent years many new duties with peacetime implications were added to the work under the administration of the coast guard, and it was anticipated that the postwar enrolment at the academy would approximate 500 cadets.

Entrance to the Coast Guard academy, which is beautifully located overlooking the Thames river, is restricted to unmarried men between the ages of 17 and 22 at the time of their appointment. Unlike the Naval and Military academies, appointment to the Coast Guard academy is obtained exclusively through nationwide competitive examinations. There are no political nominations. Examinations are held early in May each year, and application to take the examinations must be made through the coast guard commandant, Washington, D.C. Prospective cadets are examined in mathematics, English and general adaptability. A rigid physical examination is given, and no cadet is accepted who stands less than 5 ft 6 in.

The pay of coast guard cadets is $780 a year with extra allowances for food. A cadet is required to deposit $200 upon entrance to the academy for uniforms, and a portion of his pay is put aside for the purpose of outfitting him at the time of his commissioning

The new class enters the academy during the summer, usually in July The "swabs," or fourth classmen, spend their first summer in becoming indoctrinated to military life They are introduced to small boats, seamanship and military drill, in addition to attending their first classes, which include mathematics and history.

While acute needs of the service early in World War II resulted in the adoption of an accelerated three-year curriculum, the Coast Guard academy later returned to a four-year course of intensive instruction At the same time, the curriculum was revised along lines intended to liberalize the education of a cadet without reducing his theoretical and practical schoolmg. The subjects of instruction include mathematics, English composition, English and comparative literature, history, maritime economics, chemistry, physics, mechanics, electricity, radio, navigation, nautical astronomy, mechanical and ship drawing, naval construction, engineering, thermodynamics, marine engineering, engineering materials, seamanship, law, tactics, gunnery, ordnance and ballistics, communications and machine tool laboratory The Coast Guard academy confers on its graduates the bachelor of science degree as well as a commission as ensign in the United States coast guard.

The present home of the Coast Guard academy was constructed in 1932 at a cost of more than $2,000,000, and was expanded, just prior to the war, at a similar cost. The buildings are of red brick in the Georgian colonial style, and centre around the administration building, Hamilton hall, named after Alexander Hamilton, the first secretary of treasury, who founded the coast guard in 1790. During World War II, ten temporary buildings were erected as quarters for a reserve officers' training school which graduated approximately 4,000 ensigns, a large percentage of them formerly coast guard enlisted personnel detached for officer training from assignments at sea. Facilities of this school are also utilized for special post-graduate work by both regular and reserve officers.

Although, as in any military establishment, discipline and regulations play a very important role, the life of a coast guard cadet has its lighter aspects. Among them are athletics, social events and cruises. In peacetime, the first and third classes make an annual extended summer cruise aboard the larger coast guard cutters, while the second class normally remains at the academy to assist in the indoctrination of the "swabs" and to go on a shorter cruise, generally along the New England coast. The Coast Guard academy's athletic program supports teams in basketball, baseball, boxing, cross country, fencing, golf, rifle and pistol, sailing, soccer, swimming, tennis and wrestling, with each cadet undergoing a rigorous training in physical education.

The cadets are organized in a battalion of four or more companies. The officers of the battalion are first classmen and the battalion organization plays an important role in the life of the cadet, for his official, social and recreational life centres about this basic organization. The highest honour which may come to any cadet of the academy is to be chosen battalion commander in his first-class year. The choice is based on such leadership qualities as honour, personality, tact, courage, truthfulness and military knowledge and bearing.

(J. F. Fv.)

UNITED STATES MILITARY ACADEMY: *see* WEST POINT.

UNITED STATES NAVAL ACADEMY, an institution of higher learning conducted by the U.S. navy department and located at Annapolis, Md., for the purpose of preparing young men to enter the lowest commissioned ranks of the navy and marine corps. It is the principal source of officers. It was founded as the Naval school in 1845 by the Hon. George Bancroft, historian, educator and secretary of the navy, to improve the then

unsatisfactory methods of instructing midshipmen (*q.v.*). At first the course was five years, of which only the first and last were spent at the school, the intervening three years being spent on board ships on active service. It was reorganized in 1850–51 as the U.S Naval academy, with a course of study of four consecutive years A summer practice cruise replaced the omitted sea service, and gave better opportunities for intensive training.

During the Civil War the academy was moved to Newport, R.I, but was brought back to Annapolis in 1865. In the following years great improvements were effected in the organization and curriculum. During the Civil, Spanish-American and World Wars I and II, the course was shortened to provide more officers for the fleets. During World Wars I and II large classes of reserve officers were also trained at the academy.

Under the superintendent, the academy is organized into the following departments: the executive department, headed by the commandant of midshipmen, who is charged with interior discipline, drills and tactical instruction; and the academic departments of seamanship and navigation, ordnance and gunnery, marine engineering, mathematics, electrical engineering, English, history and government, languages, hygiene and physical training. The superintendent, commandant of midshipmen, and the heads of the academic departments constitute the academic board, which determines policies. There are also medical and supply departments, station ships, a hospital, a rifle range and a postgraduate school

Considering that the Naval academy does not attempt to produce specialists in any one subject, the course is equal to those of the best colleges and technical schools. Candidates are appointed upon nomination by the president from the United States at large, by the vice-president, and from the several states and territories upon nomination by the senators, representatives and delegates in congress. Also 100 each year from the navy and marine corps and 50 from the naval and marine corps reserve by competitive examination, and 40 by competitive examination from among the sons of officers, soldiers, sailors and marines who died as a result of World War I. The entrance examinations are designed to admit competent graduates of first-class secondary schools. The physical requirements are rigid. A fourth-classman or "plebe" enters in June or July, between 16 and 20 years of age, and spends the summer in drills designed to fit him for his new environment. Of the next three succeeding summers, two are spent on three months' practice cruises in battleships, and one is devoted to practical instruction in aviation, engineering, navigation and seamanship at the Naval academy, in addition to a month's coastal cruise in destroyers. The academic year runs from October to June The course covers higher mathematics, physics, chemistry, engineering, naval construction, electricity, seamanship, communications, military and international law, elementary strategy and tactics, military tactics, aeronautics, ordnance and gunnery, navigation, English, naval history, modern history, government, French, Spanish, German or Italian, hygiene and physical training. Theoretical and practical instruction are combined to the fullest extent Graduates are awarded degrees of bachelor of science.

In the early part of the century, the academy was almost completely rebuilt. The grounds, comprising 225 ac. in Naval academy proper, present a most pleasing appearance, with imposing buildings in granite, reinforced concrete, white brick and terra cotta, in the French Renaissance style, after the designs of Ernest Flagg. There are 150 major buildings, including officers' quarters, the estimated value of which is (1940) about $31,500,000. In 1939 there were 2,307 midshipmen.

In 1909 the postgraduate school was established. Selected officers are sent there from sea for a year or more of advanced work to qualify them in design, repair, construction and operation of material. One or more years of instruction at a civilian university or technical school is provided for selected groups of these officers. In 1927 a "general line course" was established, consisting of a year's work at the postgraduate school in professional subjects, followed by a year of practical work elsewhere on shore.

See Benjamin, *The United States Naval Academy;* Earle, *Life at the U.S Naval Academy;* Soley, *Historical Sketch of the United States Naval Academy;* Naval Academy Registers; and *Regulations Governing the Admission of Candidates into the U.S. Naval Academy*, published by the Bureau of Navigation, Navy Department. (C. W. N.)

UNITED STATES RUBBER COMPANY is a consolidation of more than 80 companies, several of them dating from the inception of the rubber manufacturing industry in 1839. Incorporated in 1892 as a merger of manufacturers of rubber boots, shoes and clothing, other companies were acquired to round out the complete line of products which includes every article made of rubber The company, and subsidiaries, operate in the United States 13 rubber factories, 3 cotton mills, chemical plant, reclaimed rubber factory and a shoe hardware plant, as well as a central development laboratory. In Canada, five factories are operated and there are sales offices and warehouses in the principal U.S. cities, and throughout the world.

The company has owned and operated since 1910 the largest rubber plantations in the world. They comprise 99,500 acres planted with 10,000,000 trees and the annual capacity exceeds 70,000,000 pounds. These estates were among the first to develop bud-grafting and now have areas with a current output of 1,500 pounds per acre and a potential of 2,000 pounds. (E C Bu.)

UNITED STATES SHIPPING BOARD, a board created by an act of congress approved Sept. 7, 1916, entitled:—

An act to establish a United States Shipping Board for the purpose of encouraging, developing and creating a naval auxiliary and naval reserve and a merchant marine to meet the requirements of the commerce of the United States with its territories and possessions and with foreign countries; to regulate carriers by water engaged in foreign and interstate commerce of the United States; and for other purposes

Under the act the board was authorized to form a shipping corporation with a capital stock not exceeding $50,000,000, of which a majority was to be held by the United States, for the purchase, construction, equipment, lease, charter and operation of merchant vessels in the commerce of the United States. The act provided that the $50,000,000 to be placed at the disposal of the board would be raised through the sale of Panama canal bonds. The shipping corporation provided for in the act was incorporated under the name of the Emergency Fleet corporation, but in 1927 congress changed the name to the U.S Shipping Board Merchant Fleet corporation.

In the spring of 1917, when the United States entered World War I, there were in the country 37 steel shipyards with 162 ways and 24 wooden shipyards with 72 ways, capable of launching vessels of 3,500 dead-weight tons. At the signing of the Armistice in 1918, there were in all 223 shipyards, steel and wood, with a total of 1,099 ways. At the close of the war the shipping board controlled a total fleet of 1,196 vessels of 6,540,205 dead-weight tons. These vessels were acquired by: (1) New ships built by the Shipping Board. (2) American ships requisitioned on "time" and "bare boat" charters (3) Seized German ships. (4) Commandeered Dutch ships. (5) Chartered neutral ships.

The shipping board is an independent department of the executive branch of the government The powers given the board under the act to regulate the operation of common carriers by water make its powers not unlike those of the Interstate Commerce commission. However, it is expressly provided in the act that the board has not concurrent jurisdiction with the Interstate Commerce commission in matters within the latter's power.

Following the directions of congress, contained in the Merchant Marine act of 1916, as amended in 1920, the shipping board has gradually disposed of its vessels to American citizens. Some vessels were disposed of with the obligation that the vessel would be used in a definite service and trade. The sale of some vessels carried with it the obligation to undertake alterations, betterments and reconditioning under approved plans and specifications.

UNITED STATES STEEL CORPORATION, a U.S. holding company, was incorporated under the laws of the state of New Jersey, on Feb. 25, 1901. On its formation it acquired the steel properties of many of the major steel-making interests in the United States together with anterior properties supplying the steel-making interests with raw materials, ore, coal, gas and

fluxes, including transportation facilities for servicing the steel-making operations During the years after its organization many changes have been made by merger and consolidation in the subsidiary corporations.

The subsidiary manufacturing companies operate 87 blast furnaces, 22 Bessemer converters, 360 open-hearth and electric steel furnaces and finishing mills for a wide range of steel products, and for production of cement The steel ingot capacity is about 27,627,600 net tons annually, about 34.8% of the total U S. ingot capacity. The capacity of output for rolled and other steel finished products is 19,759,000 net tons annually. For year 1939 the total sales had a value at producing plants of $801,089,000 and covered the disposal of 11,707,251 net tons of steel products, together with sales of by-products and miscellaneous items. In addition, its gross revenue from transportation and distribution service was $103,113,000. For that year the number of employees was 223,844 with a total pay roll of $368,578,000. The output of finished steel products in 1939 was 60 77% of the total capacity, the economic conditions in the United States prevailing in 1939 not calling for the full output of the properties.

Capital stock of the corporation consisted, at close of 1938, of 8,703,252 shares of no par common and 3,602,811 shares of preferred of the par value of $100 per share In 1938, the common shares were changed to a no par value stock, the same number of shares of common of no par value being substituted for previously existing common shares of $100 par value each The no par value common shares were given a stated value of $75 per share, thus making the stated value of the common shares issued $652,743,000, plus the par of the preferred shares, $360,281,100, a total stated value for both classes of stock of $1,013,025,000, which, with a stated capital surplus of $38,462,800 89, makes a grand total of stated capital value of $1,051,487,800.89 The total bonded debt, mortgages and purchase money obligations at Dec. 31, 1939, were $246,061,588, of which total $97,854,500 were obligations of the United States Steel corporation and $148,207,088 were subsidiary companies' issues. The balance of earned surplus at Dec 31, 1939, was $263,319,270. The number of stockholders was 219,727. (W. J. F.)

UNITED SYNAGOGUE, one of the six chief organizations of London Jews. These are, in order of seniority· (1) the Spanish and Portuguese Jews' congregation, founded in 1657: principal synagogue, Bevis Marks, Aldgate (built 1690–1701); three constituent synagogues The post of *Haham* has not been filled since Dr. M. Gaster resigned in 1917 after 37 years' tenure. President of the Elders, Sir Francis Montefiore, Bart. (2) West London synagogue of British Jews (Reform), founded in 1841 mainly by members of the preceding synagogues, 34 Upper Berkeley street, W.I. Minister Emeritus, Rev. M Joseph; minister, Rev. V. C Simmons, B.A.; chairman of council, P. S. Waley (3) The United synagogue, founded by act of parliament in 1870 by a union of the Duke's place and other Ashkenazic synagogues and consisting of 18 constituent, two district and 13 associated synagogues: the chief Rabbi is Dr. J. H Hertz (*q v*) and the president is Lionel de Rothschild, O B.E. (4) The Federation of Synagogues (38 constituents). (5) The Adas Yisroel (Rabbi V. Schonfeld), 124. Green lanes, N 16 (6) The Liberal Jewish synagogue, established 1910, 28 St. John's Wood road, N W 8 Rabbi I I Mattuck and Rev. M. L. Perlzweig. President, Dr C G. Montefiore Besides these six organizations there are many independent synagogues. The United synagogue is confined in its direct spiritual, educational and charitable work to London, but it exercises considerable influence over the Jews of the empire by reason of the high respect felt towards its Chief Rabbi. (*See* pp. 18. *sqq.* of H. P. Stokes, *Studies in Angl. Jew. Hist.* 1913.)

BIBLIOGRAPHY.—Details of the United Synagogue and other bodies, metropolitan, provincial and colonial, will be found in the current issue of the *Jewish Year Book.*

The United Synagogue of America is a federation of Jewish congregations, sisterhoods and young people's organizations, in the United States, Canada and Cuba. It was founded in 1913 by the late Prof. Solomon Schechter, for the purpose of advancing the cause of Judaism in America and the maintenance of Jewish tradition in its historical continuity. It was incorporated on April 24, 1916 The United Synagogue of America does not endorse innovations introduced by any of its constituent bodies, yet embraces all elements essentially loyal to traditional Judaism. In 1918, the Women's league was organized with the object of advancing traditional Judaism by furthering Jewish education among women, by creating and fostering Jewish sentiment in the home, by promoting the observance of Jewish dietary laws and home ceremonials, Sabbath and Festivals, and by generally strengthening the religious institutions of the home and the community. In 1921, the Young People's league was established for the purpose of enlisting the activity of the Jewish youth in the advancement of traditional Judaism by extending their knowledge of Judaism, deepening their devotion to its precepts and establishing closer relations between them and the Synagogue; to foster a knowledge of Hebrew and to encourage an active interest in the Zionist cause.

UNITS, DIMENSIONS OF: *see* DIMENSIONAL ANALYSIS.

UNIVERSAL, in logic, means that which our thought conceives to be common to several instances which are thus considered to be of the same kind, whether as instances of the same quality or relation or as members of the same class Universals in this sense can not be apprehended in sense-perception, only in thought, that is by means of ideas or concepts. Hence the tendency sometimes to identify "universals" with "ideas" (or "Ideas" with a capital), as in Plato, for instance, without however confusing them with mental processes as such. The predicate of a judgment or proposition is always a universal term, except perhaps in the unimportant cases in which the proposition simply refers singular terms to the same subject. Hence universals are sometimes called predicates, and the five predicables (*q v*) are known as *the* universals or the highest universals.

UNIVERSAL ATLAS CEMENT COMPANY: *see* ATLAS PORTLAND CEMENT COMPANY.

UNIVERSALIST CHURCH, a religious body organized in the United States, and represented chiefly by parishes and churches in that country and Canada A distinction should be noted between Universalism and the Universalist denomination. Universalism—the belief that the whole human race will be "saved" —was a doctrine of some of the greatest of the church fathers, notably Clement of Alexandria and Origen, and is now held by many in other communions. The Universalist denomination arose in the United States in the latter part of the 18th century.

History.—The origin of this church is commonly associated with the landing and preaching of Rev. John Murray at Good Luck, N J, in Sept 1770. Murray, a disciple of James Relly (1720–1778), a Calvinistic Universalist of London, was seeking refuge in the new world from sorrow and trouble. Persuaded that he should be an apostle of this new faith, he became an itinerant minister in Massachusetts, New York, New Jersey, Pennsylvania and settled in Gloucester, Mass. (1774). His Universalism was a protest against the doctrine of endless punishment.

Under the leadership of Hosea Ballou (1771–1852), the most influential and honoured minister of the sect for half a century, Universalists became largely Unitarian and also broke with the Calvinism of Murray. The first period of the denomination's history was largely controversial. Religious and sectarian feeling pro and contra Universalism was intense. After 1820, ministers and churches began to multiply, and newspapers were established.

Doctrine.—The fundamental tenet of Universalism may be said to be the illimitable love and goodness of God, assuring triumph over evil in human society as a whole and in the life of every individual. The historic symbol of the denomination is the Winchester Profession, adopted at the meeting of the General Convention—then a spontaneous yearly gathering of Universalists, without ecclesiastical authority—in Winchester, N.H, in Sept. 1803. It consists of three brief articles:

Article I.—We believe that the Holy Scriptures of the Old and New Testaments contain revelation of the character of God and of the duty, interest and final destination of mankind.

Article II.—We believe that there is one God, whose Nature is Love, revealed in one Lord Jesus Christ, by one Holy Spirit of

Grace, who will finally restore the whole family of mankind to holiness and happiness.

Article III —We believe that holiness and true happiness are inseparably connected, and that believers ought to be careful to maintain order and practise good works, for these things are good and profitable unto men.

At a session of the general convention in Boston in 1899 a brief statement of essential principles was adopted as follows.

1. The Universal Fatherhood of God; 2. The Spiritual Authority and leadership of His Son, Jesus Christ; 3. The Trustworthiness of the Bible as containing a revelation from God; 4 The certainty of just retribution for sin; 5. The final harmony of all souls with God

Polity.—Universalist parishes govern themselves but acknowledge (theoretically) the authority of the Universalist general convention, constituted of its officers, a board of trustees of 11 members, active ordained clergymen, two lay delegates (one a woman) from each parish and officers of the several state conventions, which are subordinate to the general convention.

Statistics.—In 1929 there were 44,599 Universalists in the United States

The number of churches was given as 443 in 1927.

UNIVERSAL LANGUAGE. The term international language is generally used to denote a second, or auxiliary, language for international use. The concept has been a constant one, as we are reminded by the story of the curse of Babel; but the ancient and modern solutions have a crucial point of differentiation. Formerly the universal language was the langage of the conqueror, and that concept has been urged in modern times in support of French, as the traditional language of diplomacy, and of English, as that of commerce. The modern world, however, tends to favor the adoption of some new linguistic medium, because it has been found that such a medium is easy to use and because it is inoffensive to national pride.

Greek, Latin and Arabic have had, at various times, the status of international languages. French occupied a similar position, particularly in the 18th and early 19th centuries, in diplomacy, social life and literature; it is still the usual international language of Europe and the Levant. English, however, has come to share the prestige of French in diplomacy, while in the orient the normal international language is English, often in the debased forms known as *Pidgin* (*q.v.*), or "business" English. Italian was used as the basis for a similar international commercial language in the Mediterranean countries during the Crusades, and has persisted in common use under the designation *lingua franca* The international language of high local prestige has been a constant phenomenon along linguistic frontiers· the Chinook of the Columbia river valley and the "pidgin" Malay of Polynesia are examples in point.

Of some 200 schemes for the creation of a suitable language on scientific principles the vast majority are projects only. They may be roughly divided into (a) *a priori* (philosophical, arbitrary) and (b) *a posteriori* (based on one or more existing languages)

Most early schemes were of the *a priori* type alluded to by Roget in his *Thesaurus*. Solresol, based on the seven notes of the scale (1817), Lingualumina (1875), Blaia Zimondal (1884), Cabe aban (1887), Zahlensprache (1901) are more recent examples. Such schemes are based on a classification of ideas translated into words bearing no relation to any other language. Obviously they depend on the caprice of the inventor; though usable as codes. they impose a great strain on the memory. One such scheme still advocated is Ro, invented in 1904 by the Rev P. Foster. It has some vocabularies, a monthly sheet *Roia*, and as literature the first chapter of St. John.

It is, however, now generally agreed that the international language must be *a posteriori*. It should be international, easy for all, neutral, euphonious, phonetic, flexible, unambiguous, logical, regular, adaptable, and must be tested by long-continued practical use on a large scale.

Esperanto.—Initiated in 1887 by Dr. L. L Zamenhof, Esperanto is claimed to possess all these characteristics. It is neutral and international in its elements, logical and regular in construction, and euphonious. The grammar can be grasped in half an hour, every rule is without exception, the spelling is phonetic and the dictionary small. Nevertheless, it has literary power, beauty, precision, flexibility and power of growth. There are some 4,000 Esperanto books, original and translated, including the Bible; the literature is rapidly growing, 100 magazines appearing regularly. The League of Nations has published a favourable memorandum (compiled from government reports) on the teaching of Esperanto in the schools of the world. The Paris chamber of commerce and the London county council teach Esperanto in their commercial schools, the London chamber of commerce examines in Esperanto In 1925 the International Telegraphic Union officially recognized Esperanto as a "clear language." The British association in 1919 appointed a committee, which in 1924 definitely recommended Esperanto as its choice. In May 1927 the Union Internationale de Radiophonie recommended broadcasting stations to use Esperanto, and in Dec. 1927, 44 stations were giving regular Esperanto transmissions. Twenty annual International Esperanto congresses have already been held, attended by from 1,000 to 4,000 members from all parts of the world On a foundation they regard as sound they are rearing a superstructure of technical vocabularies with the co-operation of expert committees The majority of universal language partisans, and nearly all the literature, are Esperantist, but there are considerable differences in pronunciation in different countries

Ido.—In 1907 Couturat and de Beaufront produced a modification of Esperanto which they named simplified Esperanto. Owing to Esperantist protests, the "linguo internaciona" was renamed Ido (an Esperanto word meaning offspring). Ido is said to be Esperanto rendered more scientific and natural; it abolishes accented letters, correlatives, the compulscry accusative, the agreement of the adjective with the noun.

Over 50 schemes have appeared for "reformed" Esperanto, "reformed" Ido or some compromise; none of these projects, however, has had any success. Prof R de Saussure, believing that some minor features of Esperanto handicap propaganda, proposed to eliminate them while preserving the essential qualities of the language From 1907 onward a stream of experimental projects and literature has issued from his language laboratory—Antido I. Antido II, Lingvo Kosmopolita, Esperantido and finally Novo-Esperanto (1925) His attitude of scientific detachment and research, however, has been insufficiently appreciated.

The first international language to be used in fact was the once famous Volapük. This was invented in 1880 by an Austrian priest, the Rev. F. Schleyer. It was founded, as to 40%, on English, but the roots were so distorted in accordance with arbitrary rules that they were almost unrecognizable, and the language was further encumbered by an almost Greek profusion of terminations and variations. The collapse of Volapük, which in 1889 claimed a million adherents and had held three successful congresses, was ensured by the refusal of Bishop Schleyer to permit any modification The central Volapük academy, Kadem Bevüretik Volapüka, directed by Dr W. Rosenberger (d. 1918), nevertheless continued its researches into the best possible form of an international language. In 1898 it issued a vastly improved language which it called Idiom Neutral and changed its own name to *Akademi de Lingu Internasional* From that time, both within and without the academy, research has not ceased, nor has the stream of proposed languages. Latinesce (by Henderson), Nov-Latin (by Rosa), Monario (by Lavagnini), Occidental (by de Wahl), Europan (by Weishart), Optex (by S. Bond), Romanal (by Michaux), deserve particular mention

The greatest advance has perhaps been made by Prof. G Peano, since 1908 director of the academy, now the Academia pro Interlingua. Peano's Interlingua arises out of an address written by

him in 1903; he began in good classical Latin and pointed out that certain features—*e.g.*, conjugation, gender, irregularity of verbs, agreement of adjectives—were no longer necessary.

As he proved each point he removed the offending practice from his own text and the address, which began in Ciceronian Latin, finished in "Latino sine flexione," a tongue now known as Interlingua, which consists of the living Latin roots in all European languages, with the modern rules of the order of words, and without grammar.

See L. Couturat and L. Leau, *Histoire de la langue universelle* (1903); W. J. Clark, *International Language, Past, Present and Future* (1912); G. Peano, *Vocabulario Commune* (1915), A. L. Guérard, *Short History of the International Language Movement* (1922); Otto Jespersen, *An International Language* (1928).

UNIVERSE OF DISCOURSE, in logic, is the limited sphere of reference within which an assertion is intended to hold good. Hence the alternative name, "limited universe." The expression "universe of discourse" was first introduced by A. De Morgan, who states his meaning as follows. "For the most part the objects of thought which enter into a proposition are supposed to be taken, not from the whole universe of possible objects, but from some more definite collection of them. Thus when we say 'All animals require air' . . . we should understand that we are speaking of things on this earth the planets, etc. . . . not being included" (*Formal Logic*, ch. iv). Boole and Jevons used the term in the same sense, namely, for a part of the real world. Subsequently the notion was extended so as to include also merely imaginary spheres of reference—the world of illusions, supernatural worlds, worlds of sheer madness and vagary, etc. (*see* W. James, *Principles of Psychology*, vol. ii, ch. xxi). In logic the question is of some importance in connection with the problem of the existential import of propositions, especially of categorical propositions.

See A. Wolf, *The Existential Import of Categorical Predication: Studies in Logic* (1905).

UNIVERSITIES. The mediaeval Latin term *universitas* was originally employed to denote any community or corporation When used in its modern sense of a body devoted to learning and education, it required the addition of other words, such as *magistrorum et scholarium* In the course of time, probably towards the latter part of the 14th century, the term began to be used by itself, with the exclusive meaning of a lawfully recognized community of teachers and scholars. But the more ancient and customary designation of such communities in mediaeval times (regarded as places of instruction) was *studium* (and subsequently *studium generale*), a term implying a centre of instruction for all.

A university often had a vigorous virtual existence long before it obtained that legal recognition which entitled it, technically, to take rank as a *studium generale*.

The university appears to have started as a scholastic guild—a spontaneous combination, that is to say, of teachers or scholars, or of both combined, and formed, probably, on the analogy of the trades guilds and the guilds of aliens in foreign cities, which, in the course of the 13th and 14th centuries, sprang up in most of the great European centres. The design, in the first instance, was little more than that of securing mutual protection. And so the university, composed as it was to a great extent of students from foreign countries, was a combination formed for the protection of its members from the extortion of the townsmen and the other annoyances incident in mediaeval times to residence in a foreign state.

It was a first stage of development in connection with these primary organizations when the chancellor of the cathedral or some other authority began to accord to other masters permission to open other schools than the cathedral school in the neighbourhood of his church; a further stage was reached when a licence to teach—granted only after a formal examination—empowered a master to carry on his vocation at any similar centre that either already existed or might afterward be formed throughout Europe —*facultas ubique docendi*.

It was a still further development when it began to be recognized that, without a licence from either pope, emperor or king, no *studium generale* could be formed possessing this right of conferring degrees, which originally meant nothing more than licences to teach.

Meaning of "Studium Generale."—In the north of Europe licences to teach were granted by the chancellor scholasticus or some other officer of a cathedral church, in the south it is probable that the guilds of masters (when these came to be formed) were at first free to grant their own licences, without any ecclesiastical or other supervision Gradually, however, toward the end of the 12th century, a few great schools claimed, from the excellence of their teaching, to be of more than merely local importance Practically, a doctor of Paris or Bologna would be allowed to teach anywhere; and those great schools began to be known as *studia generalia; i e*, places resorted to by scholars from all parts. Eventually the term came to have a more definite and technical significance. The emperor Frederick II in 1225 set the example of attempting to confer, by an authoritative bull, upon his new school at Naples the prestige which the earlier *studia* had acquired by reputation and general consent. Gregory IX did the same for Toulouse in 1229 and added to its original privileges in 1233 a bull by which anyone who had been admitted to the doctorate or mastership in that university should have the right to teach anywhere without further examination. Other *studia generalia* were subsequently founded by papal or imperial bulls, and in 1292 even the oldest universities, Paris and Bologna, found it desirable to obtain similar bulls from Nicholas IV. From this time the notion began to prevail among the jurists that the essence of the *studium generale* was the privilege of conferring the *ius ubicunque docendi*, and that no new *studium* could acquire that position without a papal or imperial bull. There were, however, a few *studia generalia* (*e g*, Oxford) whose position was too well established to be seriously questioned, although they had never obtained such a bull; these were held to be *studia generalia ex consuetudine* A few Spanish universities founded by royal charter were held to be *studia generalia respectu regni*. The word *universitas* was originally applied only to the scholastic guild (or guilds) within the *studium*, and was at first not used absolutely, the phrase was always *universitas magistrorum* or *scholarium* or *magistrorum et scholarium* By the close of the mediaeval period, however, the distinction between the terms *studium generale* and *universitas* was more or less lost sight of, and the term *universitas* began to be used alone.

ITALIAN UNIVERSITIES IN THE MIDDLE AGES

Rise of University of Salerno.—To understand why the earliest universities arose it is necessary to take account not only of their organization but also of their studies. By the 6th century the secular pagan schools of the Roman empire had been swept away. By the 12th, the cathedral and monastic schools which replaced them had attained to their highest degree of influence and reputation. But these schools taught only what was supposed to be necessary for the education of the priest and the monk. The *studia* arose out of efforts to provide instruction beyond the range of the cathedral and monastic schools Salerno, the first great *studium*, became known as a school of medicine as early as the 9th century Its medical system was originally an outcome of the Graeco-Roman tradition of the old Roman world. In the first half of the 9th century the emperor at Constantinople sent to the caliph Mamoun at Baghdad a collection of Greek manuscripts. These texts were translated into Arabic by Syrian Christians, and the Arabic was later rendered into Latin for the use of teachers in the west. Of the existence of such versions we have evidence, according to C. M. G. Bréchillet-Jourdain, long before Constantine the African (d. 1087) began to lecture on medicine at Salerno Under his teaching the fame of Salerno as a medical school became diffused all over Europe. It was distinguished by its catholic spirit; at a time when Jews were the object of religious persecution throughout Europe, they were to be found both as teachers and learners at Salerno. In 1231 it was constituted by the emperor Frederick II the only school of medicine in the kingdom of Naples. It remained a medical school only. "Nothing approaching a

regular university ever existed there" (H Rashdall, *The Universities of Europe in the Middle Ages*, vol. i, part 3, p 82)

Bologna.—The great revival of legal studies which took place at Bologna about the year 1000 had been preceded by a corresponding activity elsewhere—at Pavia by a famous school of Lombard law and at Ravenna by a yet more important school of Roman law In Bologna itself we have evidence that the *Digest* was known and studied before the time of Irnerius (1100–30), a certain Pepo being named as lecturing on the text about the year 1076 The secular character of this new study and its close connection with the claims and prerogatives of the western emperor aroused papal suspicion, and for a time Bologna and its civilians were regarded by the church with distrust But the appearance of the *Decretum* of Franciscus Gratianus, about 1140, invested the studies of the canonist with fresh importance. It was quickly regarded as official canon law, and so numerous decrees of past and almost forgotten pontiffs now claimed to take their stand side by side with the enactments contained in the *Corpus Juris Civilis* They constituted, in fact, the main basis of those new pretensions asserted by the papacy in the course of the 12th and 13th centuries It was necessary, accordingly, that the *Decretum* should be known and studied beyond the walls of the monastery or the episcopal palace Such a centre of instruction was found in Bologna, which became recognized as the chief school of both civil and canon law. But the statement that university degrees were instituted there as early as the pontificate of Eugenius III (1145–53) rests on no good authority The students found their first real protector in the emperor Frederick I, Barbarossa. Finding that their grievances were real, especially against the landlords in whose houses they were domiciled, he granted the foreign students substantial protection by conferring on them certain special immunities and privileges (Nov 1158) These privileges were embodied in the celebrated *Authentica, Habita*, in the *Corpus Juris Civilis* of the empire (book iv, tit. 13), and were eventually extended to all the other universities of Italy.

Nevertheless, Bologna did not possess a university as early as 1158 Its first university was not constituted until the close of the 12th century. The "universities" at Bologna were, as H S Denifle has shown, really student guilds. These were originally only two in number, the *Ultramontani* and the *Cismontani*, and arose out of the absolute necessity under which residents in a foreign city found themselves of obtaining by combination that protection and those rights which they could not claim as citizens Originally, they did not include the native student element and were composed exclusively of students in law Denifle thinks that the "universities" at Bologna were at one time certainly more than four in number, and we know that the Italian students alone were subdivided into two—the Tuscans and the Lombards. In the centres formed by secession from the parent body a like subdivision took place. At Vercelli there were four *universitates*, composed, respectively, of Italians, English, Provençals and Germans; at Padua there were similar divisions into Italians, French (*i.e.*, *Francigenae*, comprising both English and Normans), Provençals (including Spaniards and Catalans). According to Odofred, in the time of the eminent jurist Azo, who lectured at Bologna about 1200, the number of the students there amounted to about 10,000, of whom the majority were foreigners. It seems, therefore, reasonable to conclude that the number of these confederations of students (*societates scholarium*) at Bologna was yet greater.

The Rector.—In marked resemblance to the guilds, these confederations were presided over by a common head, the *rector scholarum*, an obvious imitation of the *rector societatum* or *artium* of the guild, but to be carefully distinguished from the *rector scholarum*, or director of the studies, with whose function the former officer had, at this time, nothing in common. Like the guilds, again, the different nations were represented by their *consiliarii*, a deliberative assembly with which the rector habitually took counsel. The students at Bologna were mostly of mature years. As the civil law and the canon law were, at first, the only branches of study, the class they attracted was often composed of men already filling office in some department of the church or state —archdeacons, heads of schools, canons of cathedrals and like functionaries forming a considerable element in the aggregate

About the year 1200 were formed the two faculties of medicine and philosophy (or the "seven liberal arts"), the former being somewhat the earlier. It was developed, as that of the civil law had been developed, by a succession of able teachers, among whom Thaddeus Alderottus was especially eminent The faculty of arts, down to the 14th century, scarcely attained to equal eminence. The teaching of theology at Bologna remained for a long time exclusively in the hands of the Dominicans, and it was not until the year 1360 that Innocent VI recognized the university as a *studium generale* in this branch.

The term "college" at Bologna long had a different meaning from that it now ordinarily conveys. The masters formed themselves into *collegia* (that is, organizations), chiefly for the conferment of degrees. Places of residence for students existed at Bologna at a very early date, but it was not until the 14th century that they possessed any organization, the humble *domus*, as it was termed, was at first designed solely for necessitous students who were not natives of Bologna. A separate house, with a fund for the maintenance of a specified number of scholars, was all that was originally contemplated Such was the character of that founded by Zoen, bishop of Avignon, in Feb. 1256 (O.S.), the same month and year. It is to be noted, in which the Sorbonne was founded in Paris. It was designed for the maintenance of eight scholars from the province of Avignon, under the supervision of three canons of the church, maintaining themselves in the university. The college of Brescia was founded in 1326 by William of Brescia, archdeacon of Bologna, for poor foreign students, without distinction as to nationality. The Spanish college was founded in 1364 for 24 Spanish scholars and two chaplains.

Other Italian Centres.—The earliest foundations in Italy after that of Bologna were the universities of Reggio nell' Emilia and Modena, both of which had flourishing schools of civil law before the close of the 12th century. Vicenza (founded 1204) and Padua (1222) both originated in migrations of students from Bologna. The University of Naples was founded by the emperor Frederick II in 1225 and was temporarily suppressed after his death. It was reconstituted in 1258. Piacenza, founded by papal charter in 1248, had little importance until 1398 when it was reconstituted by Galeazzo Visconti, duke of Milan, who caused the University of Pavia to be transferred to Piacenza. Pavia had long been famous as a school of Roman law, and for a time its fame was transferred to Piacenza. From 1404 to 1412 both universities ceased to exist. But after that date Pavia became almost as famous a school of civil law as Padua itself. Arezzo was a centre for legal study from 1215 to 1470. Rome (1303) had schools of canon and civil law for poor foreign students throughout the 14th and 15th centuries. Perugia (1308) specialized in civil law, Pisa (1343) was closed from 1403 to 1476, when it was reopened by Lorenzo dei Medici. The University of Florence (1349) had a brilliant existence in the first half of the 15th century, but was closed in 1472. Graduates of Siena, whose importance dates from 1357 though it was nominally founded in 1241, were accorded the same privileges as those of Bologna. Ferrara was famous in the latter half of the 15th century. The University of Turin was founded about the year 1400, that of Parma not until 200 years later.

PARIS IN THE MIDDLE AGES

Origin of University of Paris.—The commencement of the University of Paris well illustrates the fact that the universities arose in response to new needs The study of logic, which, prior to the 12th century, was founded exclusively on one or two meagre compends, received about the year 1100 a powerful stimulus on two occasions—first from the memorable controversy between Lanfranc and Berengarius, and second from the no less famous controversy between Anselm and Roscellinus The belief arose that intelligent appreciation of spiritual truth depended upon correct use of prescribed methods of argument. Dialectic was looked upon as the "science of sciences", and when, somewhere in the first decade of the 12th century, William of Champeaux opened in Paris a school for the more advanced study of dialectic as an art, his teaching was attended with marked success. Among his pupils

was Peter Abelard, in whose hands the study made a yet more notable advance By the middle of the century John of Salisbury could say that all learned Paris had gone well-nigh mad in its pursuit and practice Abelard taught first at the cathedral school at Notre Dame and later at the schools on the Mont Ste Geneviève, of which he was the founder and where he imparted to logic its new development.

The schools out of which the university arose were those attached to the cathedral on the Île de la Cité and presided over by the chancellor—a dignitary who must be carefully distinguished from the later chancellor of the university For a long time the teachers lived in separate houses on the island, and it was only by degrees that they combined themselves into a society and that special buildings were constructed for their classwork The flame which Abelard's teaching had kindled was not destined to expire Among his pupils was Peter Lombard, who was bishop of Paris in 1159 and widely known to posterity as the compiler of the famous volume of the *Sentences* The design of this work was to place before the student, in as strictly logical a form as practicable, the views (*sententiae*) of the fathers and all the great doctors of the church upon the chief and most difficult points in the Christian belief. The logicians seized upon it as a great storehouse of indisputable major premises, on which they argued with renewed energy and with endless ingenuity of dialectical refinement It was probably this development of new methods of instruction concurrently with new material upon which to exercise them which finally distinguished the university from the cathedral schools.

Early Organization.—The University of Paris, as already stated, took its rise entirely out of the movement carried on by teachers on the island, who taught by virtue of the licence conferred by the chancellor of the cathedral. In the second decade of the 13th century, it is true, we find masters repairing to the left bank of the Seine and placing themselves under the jurisdiction of the abbot of the monastery of Ste. Geneviève; but it was around the bestowal of this licence by the chancellor of Notre Dame, on the Île de la Cité, that the university grew up. It is in this licence that the whole significance of the master of arts degree is contained; for what is technically known as admission to that degree was really nothing more nor less than receiving the chancellor's permission to "incept," and by "inception" was implied the master's formal entrance upon, and commencement of, the functions of a duly licensed teacher and his recognition as such by his brethren in the profession. The previous stage of his academic career, that of bachelordom, had been one of apprenticeship for the mastership; and by emancipation from this state was symbolized by placing the magisterial cap (*biretta*) upon his head, a ceremony which, in imitation of the old Roman ceremony of manumission, was performed by his former instructor. He gave a formal inaugural lecture, and was then welcomed into the society of his professional brethren with set speeches and took his seat in his master's chair.

Some time between the years 1150 and 1170 the University of Paris came formally into being. Its first written statutes were not, however, compiled until about the year 1208, and it was not until long after that date that it possessed a "rector." Its earliest recognition as a legal corporation belongs to about the year 1211, when a brief of Innocent III empowered it to elect a proctor to be its representative at the papal court. By this permission it obtained the right to sue or to be sued in a court of justice as a corporate body. Papal recognition did not imply episcopal recognition, but with papal support Paris became the great transalpine centre of orthodox theological teaching Successive pontiffs, down to the great schism of 1378, cultivated friendly relations with the university and systematically discouraged the formation of theological faculties at other centres. In 1231 Gregory IX, in the bull *Parens Scientiarum* (which has been called the Magna Carta of the university), gave full recognition to the right of the several faculties to regulate and modify the constitution of the university. The fully developed university was divided into four faculties: three "superior," those of theology, canon law and medicine; and one "inferior," that of arts, which was divided into four "nations" These nations, which included both professors and scholars, were (1) the French, composed, in addition to the native element, of Spaniards, Italians and Greeks; (2) the Picard, representing the students from the northeast and the Netherlands; (3) the Norman, (4) the English, comprising, besides students from the provinces under English rule, those from England, Ireland, Scotland and Germany. The head of each faculty was the dean, of each nation the proctor. The rector, in the first instance, was head of the faculty of arts Eventually he became the head of the collective university, by the incorporation under him, first, of the students of the canon law and of medicine (which took place about the end of the 13th century), and, second, of the theologians, which took place about half a century later.

In the course of the 16th and 17th centuries this democratic constitution of the middle ages was largely superseded by the growth of a small oligarchy of officials. The tribunal of the university—the rector, deans and proctors—came to occupy a somewhat similar position to the old "Hebdomadal board" of heads of colleges at Oxford and the *caput* at Cambridge. Moreover, the teaching functions of the university, or rather of the faculty of arts, chiefly because of the absence of any endowment for the regents or teaching graduates, practically passed to the colleges Almost as much as the English universities, Paris came to be virtually reduced to a federation of colleges, though the colleges were at Paris less independent of university authority, while the smaller colleges sent their members to receive instruction in the larger ones (*collèges de plein exercace*), which received large numbers of nonfoundation members. This state of things lasted till the French Revolution swept away the whole university system of the middle ages It may be noted that the famous Sorbonne (*see* PARIS UNIVERSITY) was really the most celebrated college of Paris—founded by Robert de Sorbon in 1257—but as this college and the College of Navarre were the only college foundations which provided for students in theology, the close connection of the former with the faculty, and the use of its hall for the disputations of that body, led to the word Sorbonne becoming a popular term for the theological faculty of Paris.

In the 14th century the University of Paris had 40 colleges, governed either by secular or religious communities, and numbered among its students representatives of every country in Europe. The university became known as the great school where theology was studied in its most scientific spirit, and the decisions of its doctors upon those abstruse questions which absorbed so much of the highest intellectual activity of the middle ages were regarded as almost final. The popes, as already stated, discouraged the creation of faculties of theology elsewhere. The apparent exceptions to this policy are easily explained: the four faculties of theology which they sanctioned in Italy—Pisa (1343), Florence (1349), Bologna (1362) and Padua (1363)—were designed to benefit the Italian monasteries, by saving the monks the expense and dangers of a long journey beyond the Alps; while that at Toulouse (1229) took its rise under circumstances entirely exceptional, being designed as a bulwark against the heresy of the Albigenses. The popes, on the other hand, favoured the creation of new faculties of law, and especially of the canon law, as the latter represented the source from which Rome derived its most warmly contested powers and prerogatives.

ENGLISH MEDIAEVAL UNIVERSITIES

Oxford.—The University of Paris became the model for French universities north of the Loire and for those of central Europe and England Of the universities modelled on that of Paris, Oxford would appear to have been the earliest. Certain schools, opened within the precincts of the dissolved nunnery of St. Frideswyde and of Oseney abbey, are supposed to have been the nucleus round which it grew up. In the year 1133 one Robert Pullen, a theologian of considerable eminence (but whether an Englishman or a Breton is uncertain), arrived from Paris and delivered lectures on the Bible. Denifle maintains that there is, at best, only presumptive evidence of a *studium generale* at Oxford in the 12th century. Rashdall inclines to find the beginning in a migration of English students from Paris about 1167 or

1168. In the first-mentioned year we are told by John of Salisbury that "France, the mildest and most civil of nations," has "expelled her foreign scholars" (*Materials for the History of Thomas Becket*, ed. by Robertson, VI, pp 235–236). At about the same time we hear of an edict of Henry II, during the quarrel with Becket, recalling all clerks holding benefices in England (as they loved their benefices) and forbidding all clerks in England to cross the channel (*ibid*, I, pp 53–54). Paris was at this time the great place of higher education for English students. Immediately after 1168 allusions to Oxford as a *studium* and a *studium generale* begin to multiply The natural inference is that the breaking off of relations between England and Paris, in 1167 or 1168, led to the growth of a *studium generale* in Oxford, formed, no doubt, in the first instance of seceders from Paris In the 13th century mention first occurs of university "chests," especially the Frideswyde chest, which were benefactions designed as funds for the assistance of poor students. Hall, or places of licensed residence for students, also began to be established In the year 1257, when the bishop of Lincoln, as diocesan, had trenched too closely on the liberties of the community, the deputies from Oxford, when preferring their appeal to the king at St Albans, could venture to speak of the university as *schola secunda ecclesiae*, or second only to Paris Its numbers about this time were probably about 3,000; but whenever plague or tumult led to a temporary dispersion, a serious diminution in its numerical strength generally ensued for some time after. Against such vicissitudes the foundation of colleges proved the most effectual remedy. Of these the three earliest were University college, founded in 1249 by William of Durham; Balliol college, founded about 1263 by John Balliol, the father of the king of Scotland of the same name; and Merton college, founded in 1264. The last-named is especially notable as associated with a new conception of university education; viz, that of collegiate discipline for the secular clergy, instead of for any one of the religious orders, for whose sole benefit all similar foundations had previously been designed The statutes given to the society by Walter de Merton are not less noteworthy, being characterized not only by breadth of conception but also by a careful and discriminating attention to detail, which led to their adoption as the model for later colleges not only at Oxford but at Cambridge.

Cambridge.—The University of Cambridge, although it rose into existence somewhat later than Oxford, may reasonably be held to have had its origin in the same century There was probably a certain amount of educational work carried on by the canons of the church of St. Giles, which gradually developed into the instruction belonging to a regular *studium* In the year 1112 the canons crossed the river and took up their residence in the new priory in Barnwell, and their work of instruction acquired additional importance In 1209 a body of students migrated there from Oxford. Then, as early as the year 1224, the Franciscans established themselves in the town and, somewhat less than half a century later, were followed by the Dominicans. At both the English universities, as at Paris, the mendicants and other religious orders were admitted to degrees, a privilege which, until the year 1337, was extended to them at no other university. Their interest in and influence at these three centres were consequently proportionably great. In the years 1231 and 1233 certain royal and papal letters afford satisfactory proof that by that time the University of Cambridge was already an organized body, with a chancellor at its head In 1229 and 1231 the numbers were largely augmented by migrations from Paris and from Oxford Cambridge, however, in its turn suffered from emigration, while in the year 1261, and again in 1381, the records of the university were wantonly burned by the townsmen. Throughout the 13th century, indeed, the university was still only a very slightly and imperfectly organized community. Its endowments were of the most slender kind; it had no systematic code for the government of its members; the supervision of the students was very imperfectly provided for Although both Oxford and Cambridge were modelled on Paris, their higher faculties never developed the same distinct organization; and while the two proctors at Cambridge originally represented "north" and "south," the "nations" are scarcely to be discerned. An important step in the direction of discipline was, however, made in the year 1276, when an ordinance was passed requiring that everyone who claimed to be recognized as a scholar should have a fixed master within 15 days after his entry into the university. The traditional constitution of the English universities was, in its origin, an imitation of the Parisian, modified by the absence of the cathedral chancellor. But the feature which most served to give permanence and cohesion to the entire community at Cambridge was, as at Oxford, the institution of colleges. The earliest of these was Peterhouse, first founded as a separate institution by Hugh Balsham, bishop of Ely, in the year 1284. In 1324 was founded Michaelhouse, and two years later, in 1326, Edward II instituted his foundation of "king's scholars," afterward forming the community of King's hall Both these societies, in the 16th century, were merged in Trinity college To these succeeded Pembroke hall (1347) and Gonville hall (1348). All these colleges were expressly designed for the benefit of the secular clergy The foundation of Trinity hall (*Aula*) in 1350 by Bishop William Bateman, on the other hand, as a school of civil and canon law was probably designed to further ultramontane interests That of Corpus Christi (1352), the outcome of the liberality of a guild of Cambridge townsmen, was conceived with the combined object of providing a house of education for the clergy, and at the same time securing the regular performance of masses for the benefit of the souls of departed members of the guild. But both Trinity hall and Corpus Christi college, as well as Clare hall, founded in 1359, were, to a great extent, indebted for their origin to the ravages caused among the clergy by the great plague of 1349.

FRENCH AND SPANISH MEDIAEVAL STUDIA

France.—Montpellier was a recognized school of medicine as early as the 12th century. Before the end of the century it possessed also a faculty of jurisprudence. The university of medicine and that of law continued, however, to be totally distinct bodies, with different constitutions. On Oct. 26, 1289, Montpellier was raised by Nicholas IV to the rank of a *studium generale*.

The University of Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX on Count Raymund of Toulouse In the year 1233 it first acquired its full privileges as a *studium generale* by virtue of a charter given by Gregory IX. The University of Orléans had a virtual existence as a *studium generale* as early as the first half of the 13th century, but in the year 1305 Clement V endowed it with new privileges and gave its teachers permission to form themselves into a corporation. The schools of the city had an existence long before—as early, it is said, as the 6th century. In the 14th century its fame as a school of law was surpassed by no other university in Europe. Before the 13th century it had been famed for its classical learning.

The other French universities famous in the middle ages were Angers, Avignon, Cahors (1331) and Grenoble (1339). At Perpignan and Orange there were schools of small note.

Spain.—Valladolid, which received its charter from Pope Clement VI in 1346, attained great celebrity. In 1418, at the Council of Constance, Martin V decreed that Valladolid should take rank not only as a *studium generale* but also as a *universitas theologiae*. From this time, accordingly, the advance of the university in numbers was steady and continuous throughout the 15th century, and, along with Salamanca, it served as the model for Alcalá in 1499

Seville was founded in 1254 by Alphonso the Wise, simply for the study of Latin and of the Semitic languages, especially Arabic. Salamanca had been founded in 1243 by Ferdinand III of Castile as a *studium generale* in the three faculties of jurisprudence, the arts and medicine But the main stress of its activity, as was the case with all the earlier Spanish universities, was laid on the civil and the canon law. In the early part of the

15th century, however, the efforts of Martin V established a school of theology which was afterward regarded almost as an oracle by Catholic Europe. About the year 1600 the students are shown by the matriculation books to have numbered more than 5,000. According to Cervantes they were noted for their lawlessness. The earliest of the numerous colleges founded at Salamanca was that of St Bartholomew, long noted for its ancient library and valuable collection of manuscripts.

The only Portuguese university in mediaeval times was founded at Lisbon in 1290 and had its seat alternately there and in Coimbra, until, in the year 1537, it was permanently attached to Coimbra. It had received from King Dinis a charter, the provisions of which were mainly taken from those of the charter given to Salamanca. In 1772 the university was entirely reconstituted.

MEDIAEVAL UNIVERSITIES IN CENTRAL EUROPE

Prague.—Of the mediaeval universities in central Europe, Prague, which existed as a *studium* in the 13th century, was the earliest. It was at first frequented mainly by students from Styria and Austria, countries at that time ruled by the emperor Charles IV, who was also king of Bohemia, and at whose request Pope Clement VI, on Jan. 26, 1347, promulgated a bull authorizing the foundation of a *studium generale* in all the faculties. In the following year Charles himself issued a charter for the foundation. Charles had been a student in Paris, and the organization of his new foundation was modelled on that university, a like division into four "nations" (although with different names) constituting one of the most marked features of imitation. The numerous students—and none of the mediaeval universities attracted in its earlier history a larger concourse—were drawn from a gradually widening area, which at length included not only all parts of Germany but also England, France, Lombardy, Hungary and Poland.

Cracow.—The University of Cracow, in Poland, was founded in May 1364 by virtue of a charter given by King Casimir III the Great, but its real commencement must be considered to belong to the year 1400, when it was reconstituted. Toward the close of the 15th century the university is said to have been in high repute as a school of both astronomical and humanistic studies.

Vienna.—The Avignonese popes appear to have regarded the establishment of new faculties of theology with special jealousy; and when, in 1364, Duke Rudolph IV founded the University of Vienna, with the design of constituting it a *studium generale* in all the faculties, Urban V refused his assent to the foundation of a theological school. Because of the sudden death of Duke Rudolph, the university languished for the next 20 years, but after the accession of Duke Albert III, who may be regarded as its real founder, it acquired additional privileges.

Heidelberg.—The University of Heidelberg (the oldest of those of the German realm) received its charter (Oct. 23, 1385) from Urban VI as a *studium generale* in all the recognized faculties save that of the civil law. It was granted at the request of the elector palatine, Rupert I. But the real founder, as he was also the organizer and teacher, of the university was Marsilius of Inghen, to whose ability and energy Heidelberg was indebted for no little of its early reputation and success. In spite of the omission of the civil law in the original charter, this was included among its faculties almost from its first creation. No mediaeval university achieved a more rapid and permanent success.

Cologne.—As a result of the labours of the Dominicans, Cologne had gained a reputation as a seat of learning long before the founding of its university; and it was through the advocacy of some leading members of the mendicant orders that, at the desire of the city council, its charter as a *studium generale* (May 21, 1388) was obtained from Urban VI. It was organized on the model of the University of Paris, as a school of theology and canon law and "any other recognized faculty," the civil law being incorporated as a faculty soon after the promulgation of the charter. In common with the other early universities of Germany—Prague, Vienna and Heidelberg—Cologne owed nothing to imperial patronage, while it would appear to have been, from the first, the object of special favour with Rome. This circumstance serves to account for its distinctly ultramontane sympathies in mediaeval times, and even far into the 16th century.

Erfurt.—Erfurt, no less noted as a centre of Franciscan than was Cologne of Dominican influence, received its charter (Sept. 16, 1379) from the antipope Clement VII, as a *studium generale* in all the faculties. Ten years later it was founded afresh by Urban VI. In the 15th century the number of its students was larger than that at any other German university—a fact attributable partly to the reputation it had acquired as a school of jurisprudence and partly to the ardour with which the nominalist and realist controversies of the time were debated in its midst; its readiness in according a hearing to novel theories caused it to be known as *novorum omnium portus*.

Leipzig.—The conditions connected with the rise of the University of Leipzig are especially noteworthy, it having been the result of the migration of almost the entire German element from the University of Prague. This element comprised (1) Bavarians, (2) Saxons, (3) Poles (this last-named division being drawn from a wide area which included Meissen, Lusatia, Silesia and Prussia), and, being represented by three votes in the assemblies of the university, while the Bohemians possessed but one, had acquired a preponderance in the direction of affairs to which the latter could no longer submit. Religious differences, again, evoked mainly by the preaching of John Huss, further intensified the existing disagreements, and eventually, in the year 1409, King Wenceslaus, at the prayer of his Bohemian subjects, issued a decree which exactly reversed the previous distribution of votes—three votes being assigned to the Bohemian nation and only one to all the rest. The Germans took deep umbrage and seceded to Leipzig, where, a bull having been obtained from Alexander V (Sept. 9, 1409), a new *studium generale* was founded by the landgrave of Thuringia and the margraves of Meissen. The members were divided into four nations composed of natives of Meissen, Saxony, Bavaria and Poland.

Rostock.—At Rostock, in the north, the dukes John and Albert of Mecklenburg conceived the design of founding a university from which the faculty of theology should be excluded. The university was accordingly founded as proposed in 1419, but in 1431 Eugenius IV instituted a faculty of theology. Six years later, the whole academic community having incurred the papal ban, was fain to migrate to Greifswald, returning, however, to Rostock in 1443, but with one important exception, that of a master of arts named Henry Rubenow, who remained to become burgomaster of the former city and succeeded in persuading Duke Wratislaw of Pommern to make it the seat of a university. Calixtus III granted a bull in 1456, but it was stipulated that the rector should be a bishop, and the professorial chairs were also made partially dependent for endowment on canonries. Greifswald thus became exposed to the full brunt of the struggle which had ensued when the endeavour to nationalize the German church was terminated by the Concordat of Vienna (1448).

Freiburg.—The universities of Freiburg, in Baden, and Tübingen, in Württemberg, alike owed their foundation to the countess Matilda, by whose persuasion her husband, the archduke of Austria, known as Albrecht VI, was induced to found Freiburg in 1455, and Count Eberhard (her son by a former marriage) to found Tübingen in 1477. At Freiburg, under the supervision of its first rector, Matthew Hummel of Villingen, the numbers were soon largely augmented by migrations of students from Vienna and from Heidelberg, while its resources, which originally were chiefly an annual grant from the city council, were increased by the bestowal of canonries and prebends. Erasmus made Freiburg his residence from 1529 to 1535, during which time he may have originated the tradition of liberal learning, but in 1620, under the rule of the archduke Maximilian, the control of the humanistic studies and of the entire faculty of philosophy was handed over to the Jesuits, who also gained possession of two of the chairs of theology.

Tübingen.—The University of Tübingen was founded in 1477 with the usual four faculties, and numbered Johann Reuchlin and Philipp Melanchthon among its teachers.

Louvain.—In the Netherlands the growing wealth and pros-

perity of the different states especially favoured the formation of new centres of learning In the flourishing duchy of Brabant the University of Louvain (1426) was to a great extent controlled by the municipality, and its patronage, although ultimately attended with detrimental results, long enabled Louvain to outbid all the other universities of Europe in the munificence with which it rewarded its professors In the course of the next century the "Belgian Athens," as styled by Justus Lipsius, ranked second only to Paris in numbers and reputation It possessed no fewer than 28 colleges, while its active press afforded facilities to the author and the controversialist of which both Cambridge and Oxford were at that time almost destitute It embraced all the faculties, and no degrees in Europe stood so high as guarantees of general requirements Erasmus recorded it as a common saying that "no one could graduate at Louvain without knowledge, manners and age."

Budapest.—In Hungary, Matthias I, Hunyadi, obtained permission in 1465 to found a university where he thought best in his realm The university at Ofen (Hungarian *Buda*) was founded in 1475 It had a school of law at Pressburg, the sole remains of the university there founded by Matthias in 1465

THE PASSING OF MEDIAEVALISM

France.—The earliest 15th-century university in France was that of Aix in Provence It had originally been nothing more than a school of theology and law, but in 1409 it was reorganized as a *studium generale* on the model of Paris. Its students were divided into Burgundians, Provençals and Catalans.

The University of Poitiers was instituted by Charles VII in 1431 with the design of creating a centre of learning less favourable to English interests than Paris had at that time shown itself to be He conferred on Poitiers all the privileges collectively possessed by Paris, Toulouse, Montpellier, Angers and Orléans, and at the same time placed the university under special royal protection

The University of Caen was founded under English auspices during the short period of the supremacy of the English arms in Normandy in the 15th century Its charter (May 1437) was given by Eugenius IV, and the bishop of Bayeux was appointed its chancellor. After the expulsion of the English from France, it received a new charter. From this time the University of Caen was distinguished by its loyal spirit and firm resistance to ultramontane pretensions, and, although swept away at the French Revolution, it was afterward restored, owing to the sense of the services it had thus once rendered to the national cause. Other French 15th-century foundations are Bordeaux (1441), Valence (1452), Nantes (1463) and Bourges (1465).

Central and Northern Europe.—The University of Basle was opened in 1460, under the auspices of its own citizens, and Pius II (Aeneas Sylvius) granted the charter (Nov. 12, 1459). During the first 70 years of its existence the university prospered, and its chairs were held by eminent professors, among them historical scholars such as Sebastian Brant and Jacob Wimpheling But with the Reformation Basle became the arena of contests which menaced the very existence of the university itself, the professors being, for the most part, opposed to the new movement with which the burghers warmly sympathized Eventually the statutes were revised, and in the latter half of the 16th century the university may be said to have attained its apogee.

The University of Ingolstadt was founded on April 7, 1459. But it was not until 1472 that the work of teaching was actually commenced there. Some long-existing prebends, founded by former dukes of Bavaria, were appropriated to the endowment. Nowhere did the Reformation meet with more stubborn resistance, and it was at Ingolstadt that the Counter Reformation commenced. In 1556 the Jesuits made their first settlement in the university.

At Trier and Mainz universities were established in the second half of the 15th century. Trier received its charter as early as 1450, but the first academical session did not commence until 1473. Sixtus IV granted the charter to Mainz (Nov 23, 1476) at the request of Archbishop Diether, who was himself a great humanist.

Other foundations were those of Uppsala (1477) and Copenhagen (1479), which, although lying outside the political boundaries of Germany, reflected its influence. The charter for Copenhagen was given by Sixtus IV as early as 1475

The university founded at Wittenberg by Maximilian I (July 6, 1502) was the first established in Germany by imperial decree. Its charter is, however, drawn up with the traditional phraseology of the pontifical bulls and is evidently not conceived in any spirit of antagonism to Rome. Wittenberg was constituted a *studium generale* in all the four faculties, the right to confer degrees in theology and canon law having been sanctioned by the papal legate several months before, on Feb. 2, 1502. Wittenberg was the first academic centre north of the Alps where the Latinity and antiquated methods of the scholastic era were overthrown.

Frankfurt-on-Oder received its charter in 1506.

Scotland.—The first Scottish foundation was at St. Andrews, founded in 1411 by Henry Wardlaw, bishop of that see, and modelled chiefly on the constitution of the University of Paris It acquired all its three colleges—St. Salvator's, St Leonard's and St. Mary's—before the Reformation. The most ancient of the universities of Scotland, with its three colleges, was thus reared in an atmosphere of mediaeval theology, and undoubtedly designed as a bulwark against heresy and schism But "by a strange irony of fate, two of these colleges became, almost from the first, the foremost agents in working the overthrow of that Church which they were founded to defend" St. Leonard's more especially became a noted centre of intellectual life and Reformation principles.

The University of Glasgow was founded as a *studium generale* in 1453. Among its objects also was "the extension of the Catholic faith", but it was to produce John Knox. It was founded on the model of Bologna, but in its customs largely imitated Louvain, whose rector at the time was a Scotsman Though founded on "flourish in theology, canon and civil law, and in any other lawful Faculty," for long only the faculty of arts had a constitution Throughout the 15th century this faculty flourished exceedingly.

The University of Aberdeen was founded in 1494, mainly through the efforts of Bishop William Elphinstone, who had earlier been successively dean of the faculty of arts and rector of Glasgow university. He avoided two defects in the constitutions of St. Andrews and Glasgow by providing salaries for teachers in the higher faculties and establishing a visitorial power.

The fourth Scottish university, Edinburgh, was a post-Reformation foundation.

General Aspects.—Generally speaking, the mediaeval universities were conservative Alexander Hegius, Johan Wessel and Rodolphus Agricola carried on their work as reformers at places like Deventer, remote from university influences That there was a considerable amount of mental activity going on in the universities themselves is not to be denied; but it was mostly of that unprofitable kind which, while giving rise to endless controversy, turned upon questions in connection with which the implied postulates and the terminology employed rendered all scientific investigation hopeless. At almost every university—Leipzig, Greifswald and Prague (after 1409) being the principal exceptions—the so-called Realists and Nominalists represented two great parties occupied with an internecine struggle. At Paris, because of the overwhelming strength of the theologians, the Nominalists were, indeed, under a kind of ban, but at Heidelberg they had altogether expelled their antagonists It was much the same at Vienna and at Erfurt. At Basle, under the leadership of the eminent Johannes a Lapide, the Realists with difficulty maintained their ground Freiburg, Tubingen and Ingolstadt, in the hope of diminishing controversy, arrived at a kind of compromise, each party having its own professor and representing a distinct "nation." At Mainz the authorities adopted a manual of logic which was essentially an embodiment of nominalistic principles

In Italian universities, it was decided that these controversies were endless and that their effects were pernicious. It was resolved, accordingly, to expel logic and allow its place to be filled by rhetoric, thereby effecting that important revolution in aca-

demic studies which constituted a new era in university learning and largely helped to pave the way for the Reformation. Hence the Italian universities enjoyed a fortunate immunity from dissensions such as those which distracted the centres of learning in Germany.

The professorial body in the great Italian universities attained an almost unrivalled reputation throughout Europe For each subject of importance there were always two, and sometimes three, rival chairs, and a powerful and continuous emulation was thus maintained among the teachers "The call to a Paduan or Pisan chair was deemed the highest of all literary honours. The status of professor was, in Italy, elevated to a dignity which in other countries it has never reached, and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land While the universities of other countries had fallen from Christian and cosmopolite to sectarian and local schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still continued to assert their European universality. Creed and country were, in them, no bar—the latter not even a reason of preference Foreigners of every nation are to be found among their professors, and the most learned man in Scotland, Thomas Dempster, sought in a Pisan chair that theatre for his abilities which he could not find at home."

Spain.—To such catholicity of sentiment the Spanish universities of this period offer a complete contrast, their history being strongly modified by political and religious movements Valencia, founded in 1501, and Seville, sanctioned by Julius II in 1505, appear both to have been regarded without mistrust at Rome Julius had approved the foundation of the University of Santiago as early as 1504, but the bull for its creation was not granted by Clement VII until 1526. The design of establishing a university at Granada was deferred until 1531. Little, indeed, is to be learned respecting the new society until the foundation of the liberally endowed College de Sacro Monte by the archbishop of the province in 1605. Under the direction of the Jesuits the scholastic philosophy, together with a certain attention to Greek and Hebrew, became the dominant study. Gregory XIII in 1574 authorized the foundation of the University of Oviedo, but this was not opened until 1608, and then only with a faculty of law. After this time the universities in Spain shared in the general decline of the country, and, even after the expulsion of the Jesuits in 1769, no marked improvement is discernible in their schools until the second half of the 19th century

Mention should be made, however, of the foundations in Spanish America, which went on for more than two centuries. They included the University of Lima, Peru (now Universidad Nacional Mayor de San Marcos and claimed as the oldest university in the new world), set up as a Dominican seminary in 1551 and secularized in 1571 with faculties in philosophy and theology; Mexico City, opened in 1553; Bogotá, Colom (1572), Cuzco, Peru (1696); Havana, Cuba (1728), and Santiago, Chile (1747).

THE REFORMATION

The Reformation represents the first great boundary line in the history of European universities. Even in Roman Catholic countries its effects found expression in connection with the Counter Reformation. The influence of the humanists, and the special character which the Reformation assumed in Germany through the labours of scholars like Erasmus, Reuchlin and Melanchthon, augured well for the future. German university teaching was free from the frivolity, pedantry and scepticism which characterized so much of the corresponding culture in Italy It gave promise of resulting at once in a critical and enlightened study of the masterpieces of classical antiquity, and in a reverent and yet rational interpretation of the Scriptures and the Fathers The bigoted and ceaseless controversies evoked by the promulgation of Lutheran or Calvinistic doctrine dispelled, however, this prospect, and converted the universities into gloomy fortresses of sectarianism. For a century after the Reformation the history of Lutheran theology became almost identified with that of the German universities.

Marburg.—The first Protestant university was that of Marburg, founded by Philip the Magnanimous, landgrave of Hesse, May 30, 1527, and mainly built up out of the confiscation of the property of the religious orders in the Hessian capital. It rapidly became famous and attracted students from remote countries After 1605, when, by the decree of Count Maurice, its formulary of faith was changed from Lutheran to Calvinistic, its numbers greatly declined This dictation by the temporal power now becomes one of the most notable features in academic history in Protestant Germany.

Königsberg.—The Lutheran University of Konigsberg was founded Aug. 17, 1544, by Albert III, margrave of Brandenburg and the first duke of Prussia, and his wife *Dorothea*, a Danish princess. King Sigismund of Poland gave the charter (Sept. 29, 1561), and students who graduated as masters in the faculty of philosophy ranked as nobles of the Polish kingdom. When university Prussia was raised to the rank of a kingdom (1701) the university was made a royal foundation, and the *collegium Fridericianum*, which was then erected, received corresponding privileges. Königsberg will always be remembered as the university of Kant.

Jena.—The Lutheran University of Jena was opened on Feb. 2, 1558. Distinguished for its vehement assertion of Lutheran doctrine, its hostility to the teaching of Wittenberg was hardly less pronounced than that with which both centres regarded Roman Catholicism For a long time it was chiefly noted as a school of medicine, and in the 17th and 18th centuries was in bad repute for the lawlessness of its students, among whom duelling prevailed to a scandalous extent

Helmstedt.—The Lutheran University of Helmstedt, founded by Duke Julius (of the house of Brunswick-Wolfenbüttel), received its charter May 8, 1575, from the emperor Maximilian II It was munificently endowed by the founder and by his son, and its *Convictorium*, or college for poor students, expended in the course of 30 years no less than 100,000 thalers, an extraordinary expenditure for an institution of such a character in those days. Distinguished by its comparatively temperate maintenance of the Lutheran tenets, it attracted a considerable concourse of students, especially from the upper classes. Until suppressed in 1809, Helmstedt enjoyed the special and powerful patronage of the dukes of Saxony.

Altdorf.—The *Gymnasium Aegidianum* of Nuremberg, founded in 1526 and moved in 1575 to Altdorf, represents the origin of the University of Altdorf. Altdorf was about the poorest university in Germany, yet long one of the most eminent. Its whole endowment never rose above £800 a year.

17TH- AND 18TH-CENTURY GERMAN FOUNDATIONS

Giessen.—The conversion of Marburg into a school of Calvinistic doctrine gave occasion to the foundation of the universities of Giessen and of Rinteln. Giessen, founded by the margrave of Hesse-Darmstadt, Louis V, as a kind of refuge for the Lutheran professors from Marburg, received its charter from the emperor Rudolph II (May 19, 1607). In 1625 the university was transferred to Marburg, in 1650 it was moved back again to Giessen.

Strasbourg.—The University of Strasbourg was founded in 1621 on the basis of an already existing academy which, under the direction of John Sturm, had attracted students from all parts of Europe and especially from Portugal, Poland, Denmark, France and England. The method of Sturm's teaching became the basis of that of the Jesuits, and, through them, of the public schools in England In 1621 Ferdinand II conferred on this academy full privileges as a university. In 1681 Strasbourg became French. It was refounded by the emperor William I and before the close of the century numbered more than 1,100 students At the end of the 18th century, after its reversion to Germany, it was distinguished by an intellectual activity with which the name of Goethe is connected.

Kiel.—The royal university of Kiel was founded in 1665 by Duke Christian Albrecht of Holstein (who himself assumed the office of rector), with faculties of theology, law, medicine and philosophy. After the incorporation of Schleswig-Holstein with

the kingdom of Prussia it made a marked advance.

Halle and Pietism.—The year 1693 saw the foundation of the University of Halle, which has been described as the "first real modern university." It originated in a *Ritterschule* for the sons of the nobility Leopold I granted (Oct. 19, 1693) the requisite charter The primary object in founding a university in Halle was to create a centre for the Lutheran party; but its character, under the influence of its two most notable teachers, Christian Thomasius and A. H. Francke, soon expanded beyond the limits of this conception Thomasius and Francke had both been driven from Leipzig because of their liberal and progressive tendencies Thomasius was the first to set the example, soon after followed by all the universities of Germany, of lecturing in the vernacular instead of in the customary Latin Francke, as the founder of that Pietistic school, exercised great influence. Christian Wolff, who followed Thomasius as an assertor of the new culture, was driven from Halle by the accusations of the Pietists. In 1740, however, he was recalled by Frederick II and reinstated. Throughout the whole of the 18th century Halle was the leader of academic thought and advanced theology in Protestant Germany, although sharing that leadership, after the middle of the century, with Göttingen.

Göttingen.—The University of Göttingen (named after its founder, "Georgia Augusta"), was endowed with the amplest privileges as a university by George II of England, elector of Hanover, Dec. 7, 1736. The university included all the faculties, and two of its first professors—J. L. von Mosheim, the eminent theologian from Helmstedt, and G. L Böhmer, the no less distinguished jurist from Halle—together with Johann Gesner, the man of letters, at once established its reputation. Not least among its attractions was also its splendid library, located in an ancient monastery. The Göttingen school of history became famous The labours of the professors at Gottingen, especially J S Putter, J C. Gatterer, A. L von Schlözer and L T. von Spittler, combined with those of J. J. Mascov at Leipzig, did much to promote both a more catholic treatment and a wider scope. The method of appointment of professors was reformed by the chief curator, G A von Munchhausen, on lines similar to those already instituted in the universities of the Netherlands by Janus Dousa.

Erlangen.—The University of Erlangen, a Lutheran centre, was founded by Frederick, margrave of Bayreuth. Its charter was granted by the emperor Charles VII in 1743. In 1791, Ansbach and Bayreuth having passed into the possession of Prussia, Erlangen also became subject to the Prussian government.

NORTHERN EUROPE

The earliest Dutch university, Leyden, founded in 1575, commemorated the successful resistance of the citizens to the Spanish. Throughout the 17th century Leyden was distinguished by its learning, the ability of its professors and the shelter it afforded to the more liberal thought associated at that period with Arminianism. Much of its early success was a result of the wise provisions and the influence of the celebrated Janus Dousa. Dousa, in fact, did for Leyden and the Dutch what Münchhausen afterward did for Göttingen and the German universities. The appointment of the professors at Leyden was vested in three (afterward five) curators, one of whom was selected from the body of the nobles, while the other two were appointed by the states of the province, the office being held for nine years and eventually for life. With these was associated the mayor of Leyden for the time being. Leyden secured and maintained a very high reputation for scientific work. Other Dutch universities with a famous history are Franeker (1585), Harderwyk (1600), Gronngen (1614) and Utrecht (1634), the last being a great resort in the 18th century for English students.

The Royal University of Uppsala, whose foundation as a *studium generale* was sanctioned by Pope Sixtus IV in 1477, despite a checkered history remained the chief centre of higher education in Sweden. In the 18th century lectures began to be delivered in Swedish, but the mediaeval division of the students into "nations" continued, as at Lund (1666), until the second quarter of the 19th.

REFORMATION AND POST-REFORMATION IN BRITAIN

Oxford and Cambridge.—The influence of the Renaissance and the teaching of Erasmus, who resided at both universities, exercised a notable effect alike at Oxford and Cambridge The names of John Colet, William Grocyn and Thomas Linacre illustrate this influence at the former centre; those of Bishop John Fisher, Sir John Cheke and Sir Thomas Smith at the latter. The labours of Erasmus at Cambridge, as the author of a new Latin version of the New Testament, with the design of placing in the hands of students a text free from the errors of the Vulgate, were productive of important effects, and the university became a centre of Reformation doctrine several years before the writings of Luther became known in England The foundation of Christ's college (1505) and St. John's college (1511), through the influence of Fisher with the countess of Richmond, also materially aided the general progress of learning at Cambridge. The Royal Injunctions of 1535, embodying the views and designs of Thomas Cromwell, mark the downfall of the old scholastic methods of study at both universities; and the foundation of Trinity college, Cambridge, in 1547 (partly by an amalgamation of two older societies), represents the earliest conception of such an institution in England in complete independence of Roman Catholic traditions. Trinity (1554) and St John's (1555) at Oxford, on the other hand founded during the reactionary reign of Mary, serve rather as examples of a transitional period

Puritanism at Cambridge.—In the reign of Elizabeth, Cambridge became the centre of another great movement, that of the earlier Puritanism, St John's and Queens' being the strongholds of the party led by Thomas Cartwright, Walter Travers and others The movement continued to gather strength, and Emmanuel college, founded in 1584, owed much of its early prosperity to the fact that it was a known school of Puritan doctrine Most of the Puritans objected to the discipline enforced by the university and ordinary college statutes, especially the wearing of the cap and the surplice and the conferring of degrees in divinity. The Anglican party, headed by such men as archbishops John Whitgift and Richard Bancroft, resorted in defense to a repressive policy, of which subscription to the Acts of Supremacy and Uniformity and the Elizabethan statutes of 1570 (investing the *caput* with larger powers and thereby creating a more oligarchical form of government) were the most notable results. Oxford, although the Puritans were there headed by Leicester, the chancellor, devised at the same time a similar scheme, the rigid discipline of which was further developed in the Laudian or Caroline statutes of 1636. It was under these respective codes—the Elizabethan statutes of 1570 and the Laudian statutes of 1636—that the two universities were governed until the introduction of new codes in 1858. The fidelity with which both universities adhered to the royal cause in the Civil War caused them to be regarded with suspicion by the Puritan party, and under the Commonwealth both Oxford and Cambridge were, for a brief period, in great danger because of the distrust, which reached its highest point among the members of the "nominated parliament" (July-December 1653), of university education generally, as tending to foster contentiousness with respect to religious belief. It was even proposed by William Dell—himself the master of Caius college—to abolish the two universities altogether, as hopelessly pledged to antiquated and obsolete methods, and to establish in their place schools for higher instruction throughout the country. They were saved, however, by the firmness of Cromwell, at that time chancellor of Oxford, and, although Aristotle and the scholastic philosophy no longer held their ground, a marked improvement was observable both in discipline and morality among the students. At Oxford, under the influence and teaching of John Wilkins, Seth Ward and John Wallis, a flourishing school of mathematics was formed.

The Cambridge Platonist Movement.—In the 17th century Cambridge became the centre of a further movement (a reflex of the influence of the Cartesian philosophy), which attracted for a time considerable attention His leaders, known as the Cambridge Platonists, among whom Henry More and Ralph Cudworth were

especially conspicuous, were men of high character and great learning, although much under the influence of an ill-restrained enthusiasm and purely speculative doctrines The spread of the Baconian philosophy, and the example of a succession of eminent scientific thinkers, among whom were Isaac Barrow, master of Trinity (1673–77), the two Lucasian professors Isaac Newton (professor 1669–1702) and his successor William Whiston (professor 1702–11), and Roger Cotes (Plumian professor 1707–16), began to render the exact sciences more and more an object of study, and the institution of the tripos examinations in the course of the first half of the 18th century established the reputation of Cambridge as a school of mathematical science At Oxford, where the study had, in turn, declined, and where the statutable requirements with respect to lectures and exercises were suffered to fall into neglect, academic culture declined.

Edinburgh.—The "College of Edinburgh" was founded by charter of James VI, dated April 14, 1582 This made no mention of a *studium generale* or of any of the privileges associated with a university, and not until 1685 was the college referred to as a university in municipal records. But the charter gave the town council the right to provide for the teaching of all the subjects usual in a university, and from 1587 the college conferred degrees.

Trinity College, Dublin.—Trinity college, Dublin, was founded in 1591 A royal charter nominated a provost and a minimum number of three fellows and three scholars as a body corporate. The first five provosts of Trinity college were all Cambridge men, and under the influence of Archbishop Adam Loftus, the first provost, and his successors, the foundation received a strongly Puritan bias, but the policy of Laud and Wentworth was to make the college more distinctly Anglican as regards its tone and belief. At the Restoration its condition was found to be that of a well-ordered home of learning and piety, with its estates well secured and its privileges unimpaired. Under Bishop Jeremy Taylor, who succeeded to the vice-chancellorship, its progress in learning was considerable

THE COUNTER REFORMATION

Bamberg.—The earliest university whose charter represented the Counter Reformation was that of Bamberg, founded by the prince-bishop and opened Sept 1, 1648. At first, however, it comprised only the faculties of arts and of theology, to these were added in 1729 that of jurisprudence and in 1764 that of medicine. The university library was enriched by a collection of manuscripts from about 30 suppressed monasteries, convents and religious institutions at the time of the "secularization."

Innsbruck.—The University of Innsbruck was founded in 1672 by the emperor Leopold I. In the following century, under the patronage of the empress Maria Theresa, it made considerable progress, and received from her its ancient library and bookshelves in 1745. In 1782 the university was reduced by the emperor Joseph II from the status of a university to that of a lyceum, although retaining in the theological faculty the right of conferring degrees In 1791 it was restored to its privileges by the emperor Leopold II.

Breslau.—The University of Breslau was founded by the emperor Leopold I in 1702. When Frederick the Great conquered Silesia in 1741, he took both the university and the Jesuits in Breslau under his protection, and when, in 1774, the order was suppressed by Clement XIV he established them as priests in the Royal Scholastic institute, at the same time giving new statutes to the university.

Jesuit Influence in France.—In no country was the influence of the Jesuits on the universities more marked than in France. The civil wars in that country during the 30 years which preceded the close of the 16th century told with disastrous effects upon the condition of the University of Paris, and with the commencement of the 17th century its collegiate life seemed at an end and its 40 colleges stood absolutely deserted. To this state of affairs the obstinate conservatism of the academic authorities contributed not a little. The Jesuits did not fail to profit by this excessive conservatism on the part of the university, and during the second half of the 16th century and the whole of the 17th they contrived to gain almost a complete monopoly of both the higher and the lower education of provincial France. Their schools rose at Toulouse and Bordeaux, at Auch, Agen, Rhodez, Périgueux, Limoges, Le Puy, Aubenas, Béziers, Tournon, in the colleges of Flanders and Lorraine, Douai and Pont-à-Mousson—places beyond the jurisdiction of the *parlement* of Paris or even of the crown of France. Their banishment from Paris itself had been by the decree of the *parlement* alone and had never been confirmed by the crown. "Lyons," says Mark Pattison, "loudly demanded a Jesuit college," and even the Huguenot duke of Lesdiguières, almost king in Dauphiné, was prepared to erect one at Grenoble. The university was rescued from the fate which seemed to threaten it only by the excellent statutes given by Edmond Richer in 1598 and by the discerning protection extended by Henry IV

Nevertheless, the University of Paris remained distracted throughout the 17th century by theological dissensions—in the first instance as a result of the struggle that ensued after the Jesuits had effected a footing at the Collège de Clermont, and subsequently by the strife occasioned by the teaching of the Jansenists. Toward the close of the century a certain revival took place, and a succession of illustrious names—E. Pourchot, Charles Rollin, Bénigne Grenan, Charles Coffin, Jean-Gabriel Demontempuis, J. B L. Crevier, Charles Le Beau—appear on the roll of its teachers. But this improvement was soon interrupted by the controversies excited by the promulgation of the bull *Unigenitus* in 1713, condemning the tenets of Pasquier Quesnel. At last, in 1762, the *parlement* of Paris issued a decree (Aug 6) placing the colleges of the Jesuits at the disposal of the university, and this was immediately followed by another for the expulsion of the order from Paris, the university being installed in possession of its vacated premises. Concurrently with this measure, both history and natural science began to be cultivated with a certain success. Then came the French Revolution.

MODERN TIMES

The United Kingdom.—The Reformation marked the first great turning point in the history of the universities; the 19th century can lay good claim to having marked the second It saw the foundation of numerous new universities, many in parts of the world previously unprovided with facilities for higher education; it saw also the reconstitution of numerous ancient universities Neither process was the result of chance; new and reconstituted universities alike arose to meet new needs, the needs of an expanding world and an increasingly industrialized age. Neither left, nor could leave, the idea of the university completely unchanged.

Oxford and Cambridge.—In the United Kingdom of Great Britain and Ireland both processes took place. At the beginning of the 19th century Oxford and Cambridge were "the endowed preserve of a class" (Sir Charles Grant Robertson, *The British Universities*); by the end of it the "privileges and monopoly" of this class had been almost completely swept away. Much of the reform came from within, but two royal commissions, in 1858 and 1877, investigated the affairs of the universities and recommended drastic and far-reaching changes. During the century the range of studies was enormously extended. Exacting written examinations took the place of the often merely formal *viva voce* ceremonies. The professoriate was increased, reorganized and re-endowed, so that it became a resident, university body. General and uniform regulations were enforced for the selection, duties and salaries of professors, lecturers and examiners. Fellowships were thrown open to merit. The colleges were emancipated from their mediaeval statutes, invested with new constitutions and granted new legislative powers, while at the same time a proportion of their revenues was diverted to the uses of the university. A great mass of vexatious and obsolete oaths was swept away; in 1858 dissenters were admitted to matriculation and the B.A., and in 1871 all religious tests were abolished.

In 1863 noncollegiate students were admitted to Oxford and in 1869 to Cambridge. Women's colleges were also established. Girton (1869) and Newnham (1871–75) at Cambridge, Somerville

(1879) and Lady Margaret Hall (1878) at Oxford, the latter being followed by St. Hugh's (1886), St. Hilda's (1893) and St. Anne's (1952) Women had to wait, however, until the 20th century before the ancient English universities would admit them to degrees

Scotland.—In the 19th century three royal commissions wrestled with the affairs of the Scottish universities The first, which reported in 1830, produced no tangible results, the opposition to its proposals proving too strong But it stimulated thought about reform and paved the way for the commission of 1858, whose recommendations, embodied in the Universities (Scotland) act, 1858, remodelled the Scottish universities and assimilated their constitutions and conditions of graduation. The teaching and administrative functions were differentiated by the setting up at each university of a university court whose duty was to review all decisions taken by the *Senatus Academicus*. In addition, each university was given a general council, which was to meet twice yearly to consider "all questions affecting the well-being and prosperity of the university" The two independent degree-conferring colleges at Aberdeen, King's and Marischal, were amalgamated.

The Universities (Scotland) act, 1889, introduced further *drastic changes* It set up a Scottish universities committee of the privy council, to which all ordinances and petitions from the universities had to be referred. (This procedure was abandoned 20 years later because of the delays and difficulties it caused.) It increased the membership and powers of the university courts, adding to them representatives of the senate, the general council and the municipality within which the university was situated, and vesting in them responsibility for the business management of the university property and finances, leaving the control of education and discipline only to the *senatus*. It gave statutory recognition to the Students' Representative council (which had come into being in 1884) and empowered it to petition the *senatus* or the university court about any matter affecting the students' interests. It reorganized the curriculums of all the faculties except divinity, greatly broadening them and ending the compulsion to take the "sacred six" subjects in arts (Latin, Greek, mathematics, natural philosophy, logic and moral philosophy). It reduced the period of required residence from four to three years, established a new system of honours degrees and empowered the courts to admit women to lectures and degrees in all faculties. Most of these changes were effected by the executive commission set up under the act; they took eight years to complete.

Ireland.—Religious difficulties gravely impeded university education In 1845 three state-endowed university colleges were set up by act of parliament at Belfast, Cork and Galway, and in 1850 they were federated as the Queen's university. As no provision was made for theological teaching they were boycotted by Roman Catholics. In 1850 John Henry (later Cardinal) Newman founded a Roman Catholic university at Dublin, but this was refused the right to grant degrees. In 1879 the Queen's university was displaced by the Royal university, a nonteaching body empowered to hold examinations and grant degrees, which Roman Catholics could take.

In 1909 university education in Ireland was reorganized. Two new universities were created. the National University of Ireland at Dublin which incorporated the Queen's colleges at Cork and Galway and set up a third college in Dublin; and the Queen's university at Belfast (formerly the Queen's college). Both universities were given nominated senates, with a Roman Catholic majority in Dublin and a Protestant one in Belfast. Trinity college, Dublin, was left intact, . In all three universities there were to be no religious tests for teachers or students.

New British Universities.—*London.*—London, the first of Britain's modern universities, was born out of religious differences, which gave it a unique and unhappy start. It originated in a movement begun in 1825 by the poet Thomas Campbell, Henry (later Lord) Brougham and influential dissenters, whose aim was to set up an institution of university status for students excluded from Oxford and Cambridge by religious belief or lack of means. In 1828 the "University of London" was opened. But the project brought into being a rival group, equally influential, which in 1831 opened King's college, London, whose curriculum was similar except that it included instruction in "the doctrines and duties of Christianity, as the same are inculcated by the United Church of England and Ireland" The result was that neither college received a university charter In 1836 a nonteaching body, called London university, was created, authorized to hold examinations and confer degrees, not only, it is important to note, upon students of its two incorporated colleges, University and King's, but also upon students of such other institutions in the United Kingdom and the British colonies as it might affiliate. In 1858 the degrees of London university (except in medicine) were made available to all. Since that date London has awarded two kinds of degrees, *internal* to members of the university and *external* to anyone else passing its examinations, whether members of an educational institution or private students. This extraordinary constitution caused the University of London endless embarrassment for many years, but proved of the utmost value in assisting colleges throughout the British Commonwealth to rise to university status. They prepare for London degrees until in a position to award their own.

Attempt after attempt was made to reorganize the university, until in 1898 it was reconstituted so that only institutions within the county of London could become recognized as "schools of the university."

Durham.—The London colleges were designed for students of limited means. So was the University of Durham A residential, collegiate university, modelled on Oxford, it was founded by act of parliament in 1832 and received its charter in 1837. It was endowed from the revenues of Durham cathedral and diocese With it was associated in 1852, and more closely in 1870, the Newcastle College of Medicine In 1871 the Durham College of Physical Science was founded (in Newcastle; later called Armstrong college) and incorporated into the university. In 1908 the university was reconstituted in two divisions—Durham and Newcastle—under a single vice-chancellor but with separate teaching staffs. A further reconstitution in 1937 established a central financial control and merged the two Newcastle colleges into King's college, Newcastle-upon-Tyne.

Manchester.—Forty-four years were to elapse before another English university was founded, but within that period the progenitors of at least three others were born, and before the end of the century an additional five. In 1851 Owens college, Manchester, was established to teach "such branches of learning and science as were then or might hereafter be usually taught in English universities." In 1874, at Leeds, arose the Yorkshire College of Science; in 1876 the University college, Bristol, both absorbed earlier medical schools. Within the next 20 years there were similar colleges at Birmingham, Liverpool, Nottingham, Reading and Sheffield. In 1880 Owens college became the Victoria University of Manchester, in which were shortly federated the university colleges of Leeds and Liverpool.

Wales.—The principality of Wales played a notable part in the university college movement and, thanks to strong national feeling and an earlier development of secondary education than in England, secured its university in 1893, when the university colleges of Aberystwyth (1872), Cardiff (1883) and Bangor (1885) were federated St. David's college, Lampeter (1827), a theological college, obtained and retained the right to confer the degrees of bachelor of arts and of divinity.

"Redbrick" Universities.—The university college movement produced a rich harvest in the first decade of the 20th century. Mason college became Birmingham university in 1900. Liverpool and Leeds broke away from Manchester to obtain their own charters in 1903 and 1904. respectively. The University of Sheffield followed in 1905 and that of Bristol in 1909. These five, with Manchester, established a new tradition in English university education. Each was the product of a large industrial city, endowed by its citizens (who justly claimed a share in its government) and linked closely with its occupations. Each had a strong scientific and technological side. Each catered mainly,

though never exclusively, for local students and was consequently nonresidential All were completely free of religious tests, in some the teaching of religion was forbidden In all the fees and other expenses were low. The sobriquet "redbrick" given them later by an English writer referred primarily to their buildings but also characterized them as a homogeneous group.

COMMONWEALTH OF NATIONS

India.—Though there were previously institutions of university status, the foundation of universities as such in India was the outcome of the parliamentary inquiry which preceded the confirmation of the East India company's charter in 1853, and of Sir Charles Wood's dispatch to its court of directors in 1854. In 1857 three universities—Calcutta (Jan. 24), Bombay (July 18) and Madras (Sept. 5)—were founded on the London model as examining bodies with power to affiliate. The framers of this policy did not intend the universities to have no teaching functions, but not until the 20th century did they become fully teaching institutions. Proposals made in 1865–67 for an oriental university in the Punjab resulted in the foundation of a university college at Lahore which became a university in 1882, and in 1887 Allahabad university followed Both of these were London-model examining and affiliating bodies, though the University of the Punjab was also authorized to appoint teachers.

In 1902 a universities' commission recommended, and in 1904 an act provided, that the older universities should become teaching bodies. The conditions for affiliation were stiffened In 1913 a government resolution proposed the establishment of residential universities at Dacca, Aligarh and Benares and the creation of new universities at Rangoon, Patna and Nagpur, but the outbreak of World War I delayed these developments.

Canada.—The history of the universities of Canada is highly complex, reflecting the varied religious and political influences in the making of the nation. All the older universities except two were founded by religious bodies, among whom the Roman Catholics, Anglicans, Presbyterians, Methodists and Baptists were prominent Broadly speaking, these copied three models, Paris, Oxford and Edinburgh, according to the nationality of the founders. Later, after efforts, largely unsuccessful, to overcome the denominational problem by founding universities on the London style, there came the evolution of a distinctively Canadian type of federated university. Finally, the 20th century saw, in the western provinces, the foundation of fully state-provided universities.

The French Laval university, Quebec, was founded as late as 1852, but the Seminary of Quebec, from which it sprang, dates from 1633. The University of Montreal was founded in 1878 as a branch of Laval, from which it was finally separated in 1920. Other Roman Catholic foundations were Ottawa (1849) and St. Francis Xavier, Antigonish, N.S. (1853), the latter with no religious tests for entrance or degrees. Three colleges, each called King's college and each a Church of England establishment, were early founded by the immigrant American loyalists and received royal charters: at Windsor, N.S. (1802, later moved to Halifax), Toronto (1827)—later the University of Toronto—and Fredericton, N.B. (1828), which in 1859 was secularized as the University of New Brunswick. All three were modelled upon Oxford. Later Anglican foundations included the University of Bishop's College, Lennoxville, Que. (1853), and Western university (1878); the latter became nondenominational in 1908 and later changed its name to Western Ontario The Baptists founded Acadia, Wolfville, N.S. (1838), and in 1887 amalgamated two colleges to form McMaster, now located in Hamilton, Ont. The Presbyterians founded Queen's, Kingston, Ont. (1841), modelling it on Edinburgh, it became nondenominational in 1912. The Methodists founded Mount Allison academy at Sackville, N.S., which was given a university charter in 1858 and later also became nondenominational.

The two private foundations, Dalhousie (Halifax, N.S.) and McGill (Montreal, Que.), were both from the start nonsectarian. Both were Scottish-type universities. Each had a precarious early existence; Dalhousie, though founded in 1818, did not open until 1838, and was closed again between 1843 and 1863. The reopening was made possible by the closing of various Presbyterian and Congregational colleges In 1868 the government withdrew grants from denominational colleges, and thus, with the increasing cost of maintenance, compelled them to think seriously about federation. In 1887 a scheme was approved for a university of Toronto consisting essentially of "a group of arts or divinity colleges gathered about a central university, supported and controlled by the State, the University conducting examinations, conferring degrees (except in Divinity), and giving the instruction in those branches of learning which are costly to conduct, or are taken by only a few students, or are professional in character." (*Yearbook of the Universities of the Commonwealth, 1949–50*, p. 547). This scheme became archetypal.

For nearly 20 years Toronto university was administered by a government department. In 1906 it was granted an independent board of governors, nominated by the lieutenant governor in council, and the right of nominating to academic appointments was vested in the president of the university. In 1907 Manitoba university was reconstituted on the same lines. In 1906 and 1907 provincial universities, modelled on Toronto, were founded in Alberta at Edmonton and in Saskatchewan at Saskatoon.

Australia.—The earliest Australian universities successfully combined mediaeval and modern features Each was established by the state legislature, yet constituted a self-governing corporation. Each relied for support upon both public money and private benefactions. Each was nonresidential, nondenominational and secular, yet each made provision for including residential denominational colleges on religious foundations. Geography dictated their location in capital cities. The first to be founded was Sydney (1850), closely followed by Melbourne (1853) Each of these had, before the end of the 19th century, three colleges for men and residential accommodation for women Adelaide was similarly established in 1874 but did not incorporate any colleges until the 20th century When the University of Queensland was founded in 1909 it was made wholly residential, and four colleges, including one for women, were established within four years Living at home was recognized as residence. The universities of Tasmania, Hobart (founded 1890, charter 1913), and Western Australia, Nedlands (1911), had no such provision.

New Zealand.—In 1869 the University of Otago, Dunedin, was founded by provincial ordinance, with power to grant degrees in arts, law and medicine. But the next year the University of New Zealand, Wellington, a purely examining body, was established, and in 1874 Otago agreed to affiliate with it and to hold in abeyance its own right to grant degrees. Canterbury University college, Christchurch (founded 1873), also affiliated, as did later Auckland (1882) and Victoria (1897) In the early days New Zealand maintained academic standards by appointing external examiners from England.

Union of South Africa.—The development of university education in South Africa aptly illustrates the truth that universities are born to meet new needs. Higher education began with the founding in 1829 of South African college, Capetown, a proprietary institution which for 20 years had no competitors. Then within six years appeared the Diocesan college, Capetown (1849), St. Andrew's, Grahamstown (1855), and Grey college, Bloemfontein (1855). In 1858 there was established, primarily to examine candidates for public appointments, a board of examiners in literature and science, which shortly began to conduct examinations not unlike those for university degrees This greatly stimulated the work of the colleges, and by a natural sequence the University of the Cape of Good Hope, an examining and degree-granting body, took the place of the board in 1873. Almost simultaneously the Cape parliament passed a higher education act providing for salary grants to professors at recognized colleges. This further stimulated progress and incited other college foundations, including Stellenbosch (1874), which was raised to university status in 1916. Later came the Kimberley School of Mines (1896), Pretoria University college (1908) and Natal University college (1909), all destined eventually to graduate into universities.

CONTINENTAL EUROPE

France.—On Sept. 15, 1793, the universities and colleges throughout France, together with the faculties of theology, medicine, jurisprudence and arts, had been abolished by a decree of the convention, and the whole system of national education may be said to have remained in abeyance until 1808, when Napoleon I promulgated the scheme which in many essential features obtains today The whole system of education, primary, secondary and higher, was made subject to the control and direction of the state France was divided into 17 districts, designated "academies," each administered by its own rector and council, but subject to the supreme authority of the minister of public instruction, and representing certain faculties which varied at different centres, in conformity with the new scheme of distribution for the entire country The "University of France," as it was styled, became little more than an abstract term signifying collectively the various centres of professional education in their new relations to the state While three new "academies"—those of Lille, Lyons and Rennes—were formed in 1808, many of the pre-existing centres were completely suppressed. In some cases, however, the effacement of an ancient institution was avoided by investing it with new importance, as at Grenoble; in others, the vacated premises were appropriated to new uses connected with the department, as at Avignon, Cahors and Perpignan. Each rector of an "academy" was also constituted president of a local *conseil d'enseignement*, in conjunction with which he nominated the teachers in elementary and secondary schools. The appointments were ratified by a promotion committee in Paris

"Free Faculties"—In 1895 the government was prevailed upon to sanction the institution of certain "free faculties," as they were termed, to be placed under the direction of the bishop, depending for support upon voluntary contributions and each including a faculty of theology, the best known being those of Paris and Lille The faculty at Marseilles was called upon to unite with the academy of Aix, its faculties being restricted to mathematics and natural science (including a medical school), while faculties of law and philosophy were fixed at Aix, which possessed also the university library In the capital itself, the University of Paris and the École Pratique des Hautes Études carried on the work of higher instruction independently of each other—the former with faculties of Protestant theology, law, medicine, science, letters and chemistry, distributed over the Quartier Latin; the latter with schools of mathematics, natural science, history, philology and history of religions centred at the Sorbonne

In 1896 the higher education of France was decentralized and the existing academies, consisting of isolated faculties, were converted into regional universities, while the Sorbonne, from being the University of France, became the University of Paris. The total number of universities, including that of Algiers, was 16.

Germany.—The political storms which marked the close of the 18th and the beginning of the 19th century gave the deathblow to not a few of the ancient universities of Germany. Mainz and Cologne ceased to exist in 1798, Bamberg, Dillingen and Duisburg in 1804, Rinteln and Helmstedt in 1809, Salzburg in 1810 and Erfurt in 1816. Altdorf was united to Erlangen in 1807, Frankfurt-on-Oder to Breslau in 1809 and Wittenberg to Halle in 1815 The University of Ingolstadt was first moved in 1802 to Landshut and from there, in 1826, to Munich, where it was united to the academy of sciences which had been founded in the Bavarian capital in 1759. Munster, in Prussia, which had been constituted a university by Maximilian Frederick (elector and archbishop) in 1772, was abolished in the year 1818; but two faculties, those of theology and philosophy, continued to exist, and in 1843 it received the full privileges of a Prussian university, together with the designation of a royal foundation. Of those of the above centres which altogether ceased to exist, few were much missed or regretted, that at Mainz, which had numbered about 600 students, being the one notable exception. The others had, for the most part, fallen into a perfunctory and lifeless mode of teaching, and, with wasted or diminished revenues and declining numbers, had long ceased worthily to represent the functions of a university. Whatever loss may have attended their suppression was more than compensated by the activity and influence of the three great German universities which were born in the 19th century

Munich after having been completely reorganized, soon became a distinguished centre of study in all the faculties, and its numbers, allowing for the wars of 1866 and 1870, continuously increased The eminence of its professoriate, among whom were J J I von Döllinger, Justus von Liebig, Friedrich von Schelling, K. Zeuss and W von Giesebrecht, attracted students from all parts of Europe.

The University of Berlin, known as the *Royal* Friedrich Wilhelm university, was founded in 1809, immediately after the peace of Tilsit, when Prussia had been reduced to the level of a third-rate power. It incorporated the famous academy of sciences Wilhelm von Humboldt, supported by Frederick William III, adopted for it principles which not only raised it to a foremost place among the universities of Europe but also largely conduced to the regeneration of Germany. Attachment to any particular creed or school of thought was expressly repudiated in favour of complete *Lehrfreiheit* Each teacher presented freely his own views The growth of the university was astonishing; before the end of the 19th century it had more matriculated students than any university except Vienna

The University of Bonn, founded in 1818, also by Frederick William III, became known as the *Rhenish* Friedrich Wilhelm university. It was the king's design to introduce into the Rhine provinces the classic literature and the newly developed scientific knowledge of Germany proper. Accordingly, he summoned to his aid the best available talent, including B G Niebuhr and A W. von Schlegel, with C. F. Nasse in medicine and Georg Hermes in theology. In the last-named faculty Bonn combined the opposed schools of theological doctrine of the Evangelical (or Lutheran) and of the Roman Catholic churches

The German universities underwent considerable changes as a result of the compulsory military service required by the law of 1867, and the events of 1870 were not unconnected with the martial spirit that had been evoked in the student world

The Low Countries.—The settlement of Europe in 1814–15 created the "Kingdom of the Netherlands" comprising Holland and Belgium. The universities of Franeker and Harderwijk were suppressed and those of Ghent and Liège created in 1815, and a uniform constitution was given to Dutch and Belgian universities. It was provided that there should be attached to each a board of curators, consisting of five persons "distinguished by their love of literature and science and by their rank in society," to be nominated by the king. At least three had to come from the province in which the university was situated. When in 1830 Belgium was created as a separate kingdom, further changes took place there. From Louvain, the chief Catholic centre, the faculties of law, medicine and philosophy had already, in 1788, been moved to Brussels; in 1834 Brussels was constituted a free and independent university with a new fourth faculty of natural science. Having, however, no charter, it continued incapable by law of possessing property. Louvain and Brussels came to represent the two chief political parties in the realm, while the universities of Ghent and Liège recruited their students mainly from the two chief language groups, the Flemish and the Walloon. In Holland, where no such marked differences existed, the universities of Groningen, Leyden and Utrecht were in 1876 assimilated in constitution, each being administered by a consistory of five rectors with a senate composed of the professors in the respective faculties. The opening of the Free University of Amsterdam in 1880 more than repaired the loss of Franeker and Harderwijk, particularly as the progress of this new centre during its first ten years was remarkably rapid.

Scandinavia and Iceland.—The University of Christiania (now Oslo) in Norway was founded in 1811 as a state institution yet given self-government by a *collegium academicum* It had at first four faculties, theology, law, medicine and philosophy; in 1860 the last was divided into the faculties of letters and science. Women gained admittance in 1882, and the first woman professor

was appointed in 1912. In 1910 the Norwegian Institute of Technology was opened at Trondheim. No new universities were founded in Sweden, though institutions at Göteborg (1887) and Stockholm (1877) achieved something of university status In Finland, the University of Abo was moved to Helsingfors (Helsinki) in 1828. In 1911 the University of Iceland was created by bringing together schools of theology (1847), medicine (1876) and law (1908). The university is probably unique in having been conducted for the first 29 years of its life in the parliament building (*Althingishus*).

Switzerland.—In Switzerland the universities shared in the conflicts handed down from the days when the Helvetic republic was first created. In 1832, Basle having joined the League of the Catholic Cantons, the Confederates divided the canton into two and agreed to raise the flourishing *Hochschule*, which already existed at Zürich, to the rank of a university—a measure which may be said to mark a turning point and a new epoch in the history of higher education in the republic. The gymnasium of Berne, originally established under the teaching of Ulrich Zwingli, developed, in 1834, into a university with all the faculties As early as 1586 Lausanne had been a noted school for the education of Protestant ministers, but it was not until 1806 that chairs of philosophy and law were established, to which those of natural science and literature were added in 1836 and, somewhat later, that of medicine. Not, however, until 1891 was Lausanne formally constituted a university. At Geneva the famous academy of the 16th and 17th centuries, long distinguished as a centre of Calvinistic teaching, became merged in 1876 in a university, where the instruction was given mainly in the French language. With this was also incorporated an earlier school of science in which H B. de Saussure and A. P. de Candolle had once been teachers. Fribourg, founded in 1889, began with only two faculties, those of law and philosophy, to which one of theology was added in the following year. At Zurich in 1872, and later at Geneva and Berne, women were admitted to lectures, and in 1892 were permitted to lecture.

Austria-Hungary.—The Austrian universities declined rather than advanced during the 19th century. Salzburg, founded in 1623, was suppressed in 1810. Throughout the first half of the century Vienna was in an extremely depressed state; though its medical school attained an unrivalled reputation, its other faculties were allowed to languish. Olmutz (Olomouc), founded 1581, was closed in 1853. Lemberg, founded in 1774 by the emperor Joseph II, was in 1805 moved to Cracow, but in 1816 opened on an independent basis. In 1848 it lost by bombardment its buildings, library and natural history museum. Graz (1586) alone flourished. In 1875 Czernowitz university was founded, three years after that of Klausenburg (Cluj), the chief Magyar centre in Hungary. Zagreb, in Croatia, originally founded in 1669, was reopened in 1874.

Russia.—At the beginning of the 19th century Russia possessed only three universities: Moscow (1755), founded by the empress Elizabeth; Vilnius (1573), which was Polish, and Dorpat (Tartu) (1632), which was virtually German Under the enlightened policy of Alexander I were founded the universities of Kharkov (1804) for New Russia, Kazan (1804) for the countries about the Volga but designed also for the populations of Finland and Siberia, and St. Petersburg (1819). Each of the foregoing six universities had a definite district assigned to it, and, as a further incentive to the pursuit of academic studies, a ukase promulgated in 1809 proclaimed that in all appointments to official posts throughout the empire the holders of university degrees would receive the first consideration. In 1835 the foundation of the St. Vladimir university of Kiev absorbed the university at Vilnius. Odessa, founded in 1865, was designed to be the university of New Russia. Although at St. Petersburg considerable attention was regularly given to the teaching of languages, especially those of Armenia, Georgia and Tartary, the general status of the Russian universities continued, throughout the greater part of the century, exceptionally low In 1884 they were all reconstituted by the promulgation of a "universal code", with this the statutes of the universities at Dorpat (1632) and Warsaw (1816) were essentially in agreement. The study of the Slavonic languages received a considerable stimulus, especially when, by a decree in May 1887, the use of the Russian language was made obligatory in all places of instruction throughout the Baltic provinces. During the ensuing 20 years the general influence of Dorpat rapidly spread far beyond the Baltic provinces. In 1889 the Russification of the university went far to deprive it of its claim to be considered German.

The University of Tomsk in western Siberia, founded in 1888, depended chiefly on a grant from the state, aided by private liberality.

Greece.—The University of Otho at Athens, founded by King Otho (Otto) in 1837, was modelled on the university systems of northern Germany It originally included only four faculties, theology, jurisprudence, medicine and philosophy, to which one of applied mathematics was subsequently added. It was later renamed the National University of Athens.

Rumania, Bulgaria and Turkey.—The University of Jassy (1860) was founded by Prince Cuza of Rumania, and together with the newly founded University of Bucharest received its completed organization in 1864 Both were constituted state institutions and were represented in the senate, although not receiving any fixed revenues from the government In the Kliment Ochridski university of Sofia (1888) in Bulgaria, faculties were established of history, philology, physics, mathematics and jurisprudence, the main object in view being the training of competent schoolteachers and lawyers and affording them the means of gaining an intelligent insight into the real wants of the native population The University of Istanbul, founded 1453, was until the 19th century a religious school.

Mediterranean Lands.—The distracted state of Italy long prevented advance. In 1875, when the educational system was reformed, an attempt was made to assimilate the universities to the German pattern, but this policy was quickly reversed. In 1890 four "free universities," Camerino, Ferrara, Perugia and Urbino, were created, and women were admitted In Sicily the University of Palermo, founded 1779, was closed in 1805 but reopened in 1850 and became of considerable importance and size. The Sardinian universities, Cagliari (1596) and Sassari (1617) were similarly closed and reopened, but attained little eminence

Spain.—Lifeless routine and unreasoning tradition characterized the Spanish universities until the second half of the 19th century. In 1857 the entire system of education was placed, as in France, under the control of the minister for public instruction The kingdom was divided into ten university districts, each in the charge of a rector, and a precise plan of instruction was prescribed in which every hour had its appointed lecturer and subject. At every university philosophy, natural science, law and medicine were to be studied, but no provision was made for theology, this being transferred to the seminaries in the episcopal cities. In the same year the University of Manila in the Philippines was formally founded; it had been in existence for 250 years.

(J B. Mu.; C. Br.; H. C. D.)

THE UNITED STATES

The origins of the universities in the U.S. are to be found in the colleges established in the colonies before the nation was formed. Nine such colleges were founded: Harvard college, 1636; College of William and Mary, 1693, Yale college, 1701, College of New Jersey, 1746, King's college, 1754; College and Academy of Philadelphia, 1755 (originated in a charity school trust created in 1740); Rhode Island college, 1764, Queen's college, 1766; and Dartmouth college, 1770. In general, these institutions represented the arts course provided in the colleges of the universities of England, particularly at Cambridge and Oxford.

The principal purpose of the colonial colleges was to train a class of learned men specifically for the Christian ministry, although some of them aimed also at training a body of men in culture and knowledge for service in the state. The College and Academy of Philadelphia, in contrast with the other colleges, was founded on a broad plan of education, which included a considerable amount of mathematics, science, government and law. It established a medical department in 1765—the first in the country. Two years later King's college also opened a medical department.

From the American Revolution to the Civil War there was a

spectacular increase in the number of new colleges established During this period some of the older colleges came to be known as universities, and new institutions bearing the name were founded. The constitution of Massachusetts adopted in 1780 refers to Harvard college as the "University at Cambridge." The College and Academy of Philadelphia, through legislative action, became the University of Pennsylvania in 1791, and in 1804 Rhode Island College was named Brown university. The names of three other colonial colleges were officially changed at later dates—Yale college to Yale university, 1887; the College of New Jersey to Princeton university, 1896; King's college to Columbia college, 1784, and to Columbia university, 1912—although all three operated as universities before these dates Queen's college became Rutgers college in 1825 and Rutgers university in 1924. The legislature of New Hampshire attempted in 1816 to take over Dartmouth college and make of it a state university, but a decision of the United States supreme court in 1819 stopped this action.

The state university, destined to become one of the important and characteristic types of U S. higher education institutions, had its origin in the latter part of the 18th century: the University of North Carolina was provided for in the state constitution of 1776, chartered in 1789 and opened in 1795, the University of Georgia was chartered in 1875 and opened in 1801. The Indiana constitution of 1816 made it the duty of the general assembly "to provide by law for a general system of education, ascending in a regular gradation from township schools to a State university, wherein tuition shall be gratis, and equally open to all." This statement represents the ideal of the state university—the capstone of the system of public education.

The most notable early example of the state university was the University of Virginia, which, through the influence of Thomas Jefferson, was established by legislative act in 1819 and opened in 1825. The model for the state universities, however, particularly those in the western states, was the University of Michigan, opened in 1841 and reorganized in 1850. The establishment of the state-universities in the states carved out of the public lands in the west was greatly aided by grants of land from the federal government, beginning with the admission of Ohio into the union in 1803 The State University of New York, created by the legislature in 1948, was, at mid-20th century, the most recently established state university. It consists of a number of state-owned institutions of higher education located at various places and of such new ones as may be established

By 1952, 45 states each maintained one or more state universities. In two others there were "semipublic" universities. (1) the University of Vermont, privately supported to a large extent, but receiving state aid, and with some of the trustees appointed by the legislature; (2) Rutgers university, designated in 1945 as the State University of New Jersey, largely under private control, but with 9 of the 58 members of the board of trustees state officials serving in an ex officio capacity and 5 appointed with advice and consent of the state senate. The state of Pennsylvania supports Pennsylvania State college, a privately controlled institution, and it gives also some financial assistance to several privately controlled universities, including the University of Pennsylvania. Alaska, Hawaii and Puerto Rico maintain territorial universities Distinguishing characteristics of the typical state university are: (1) creation and direct support by the state government; (2) control by a publicly appointed or elected board; (3) free or low tuition to students who reside in the state, and (4) provision for numerous educational services to the state in addition to instruction on the campus.

Fourteen municipal colleges and universities had been established by mid-20th century. College of Charleston (S.C.); College of the City of New York, comprising four colleges; the universities of Akron, Cincinnati, Houston (district), Louisville, Omaha, Toledo and Wichita; Washburn Municipal university of Topeka, Kan., and Wayne university, Detroit, Mich. These institutions are controlled and supported by the municipalities in which they are located.

A group of institutions which became a prominent feature of higher education in the United States are the land-grant colleges and universities, which numbered 69 in 1950. About 200 colleges for women had also been established by mid-century. (*See* WOMEN, EDUCATION OF.)

As large personal fortunes were amassed in the United States another type of university was established—that endowed by individual munificence. Among these universities (with date of original founding) were: Tulane (1834), Emory (1836), Duke (1838), Cornell (1865), Vanderbilt (1873), Johns Hopkins (1876), Stanford (1885) and Chicago (1890). Other highly endowed institutions were the Massachusetts Institute of Technology, founded in 1861 and opened in 1865; Rice institute, 1912; Carnegie Institute of Technology, 1900; and California Institute of Technology, 1891. A number of the older universities also became the recipients of large endowments, among them Columbia, Brown, Dartmouth (college), Harvard, New York, Northwestern, Pennsylvania, Princeton, Rochester, Washington, Western Reserve and Yale. A few state universities likewise acquired large endowments, some from private and some from public sources, among them California, Michigan, Minnesota, Texas, Virginia and Washington. The endowments of these 30 institutions at mid-century ranged from $13,217,000 (Tulane) to $241,185,000 (Harvard), the average being $51,091,000. When the federal government was organized, some leaders of the nation desired the establishment of a national university, and subsequently numerous proposals for such an institution were placed before congress, but none was enacted into law. Some of the federal interests are served through institutions maintained by the federal government, such as the United States Military academy; other federal interests are served through certain relationships established with higher education institutions through grants-in-aid, payment for contracted services and loans for the construction of housing for students and faculty members.

Control and Organization.—Some universities are publicly controlled—by a state, a municipality or a district. Others are controlled by private organizations, which usually receive their charters from the states in which they are located. In general, each university is under direct control of a lay board, usually known as a board of trustees, although other titles, such as board of regents and board of directors, are also used. Boards of publicly controlled universities are elected by the voters of the state or the municipality which maintains the institution, or they are chosen by a governmental official or agency. In a few states all the state institutions of higher education are controlled by one board, as in Georgia and Oregon. The members of the boards of privately controlled universities elect persons to fill vacancies; such boards are known as self-perpetuating. The members of the boards that control church-related universities are, in many instances, elected by the religious organizations which maintain the institutions. For many universities the alumni elect some members of the boards of trustees. Most of the Roman Catholic institutions are controlled by the religious orders, though some are under diocesan control

The actual administration of a university is assigned to administrative officers employed by the board of trustees. Usually the principal officer is called president or sometimes chancellor. He has a heavy responsibility and large authority in the direction and management of the institution. Among his principal assistants are vice-presidents, directors, deans and business managers. The various colleges and schools of the university are in charge of deans, who have large responsibility for such matters as selection of faculty members, leadership in development of the curriculum and improvement of the quality of instruction. Each college or school is organized in departments or divisions. In most universities the faculties have considerable control over educational policy, especially matters relating to admission requirements, organization of the curriculum and requirements for degrees; in the larger universities this control is usually delegated to a smaller group selected entirely or partly by the faculty or by instructional staff members holding certain positions.

Educational Programs.—At the centre of the typical university in the United States is the college of arts and sciences. Students enter it upon completion of secondary education. The cur-

riculum, which is four years long, leads to the bachelor's degree—bachelor of arts or bachelor of science. The college of arts and sciences offers a program of education for students who take all their work in the arts and sciences, and provides a considerable amount of instruction to students who are registered in the professional schools of the university. The curriculum is usually so arranged as to require the student to obtain a general knowledge of a number of fields and more highly specialized and advanced knowledge in one or two fields.

The college in The University of Chicago provides a program of education which is different from that in the usual college of arts and sciences. It begins at the end of the sophomore year of high school and is normally completed at the end of four academic years. Students who complete this program are awarded the degree of bachelor of arts.

Most of the formal professional education in the United States is acquired in the universities, where it is organized in various patterns. Much of it consists of four-year programs which students enter upon completion of secondary education and which end with attainment of the bachelor's degree Examples are agriculture, business administration, education (preparation of teachers of elementary and secondary schools), engineering, fine arts, forestry, journalism and pharmacy The degrees conferred for the completion of study in special fields frequently carry designation of those fields, as bachelor of education, bachelor of fine arts and bachelor of business administration; or as bachelor of science in education, bachelor of science in engineering, bachelor of science in pharmacy; or as bachelor of arts in education, bachelor of arts in business administration

There is a tendency to lengthen programs of education for the professions. This is usually done by including, as an entrance requirement of the professional college or school, the completion of a specified amount of study in a college of liberal arts or a college of arts and sciences. As an example, three years of college work constitute a minimum for admission to the study of medicine. The medical curriculum is four years long The educational patterns in some other fields are: dentistry, two years in college and four years in the school of dentistry; veterinary medicine, two and four; law, three and three or three and four. For admission to professional training in several fields, possession of a bachelor's degree is a prerequisite, and the professional curriculums range in length from one to three years; examples are hospital administration, public health, social work and theology The first degrees conferred for the completion of curriculums in these professional fields are doctor of medicine, doctor of dental surgery or doctor of dental medicine, bachelor of laws, doctor of veterinary medicine, master of hospital administration (master of business administration, master of science in some schools), master of public health and doctor of public health, master of social work and bachelor of divinity.

All universities, except those that are universities in name only, provide programs of advanced study leading to graduate degrees. Such study is usually supervised by an administrative division known as a graduate school, which establishes and enforces policies and standards for advanced work. The instruction, however, is usually carried on by the regular departments of the university. In some universities the graduate work in professional studies is carried on by the professional schools independent of the graduate school. As a prerequisite for admission to graduate study a student must present a bachelor's or a first professional degree or the equivalent.

The principal purposes of graduate education are: to prepare college and university teachers; to prepare specialists in the various professions; and to prepare students to carry on research. Graduate study also prepares teachers of elementary and secondary schools for better service. Programs of graduate study consist of (1) specialized and advanced courses aimed at broadening and deepening the student's knowledge in one or a few fields and (2) independent study and research, largely original in character, intended to develop ability to do research in a particular field. The degrees conferred for graduate study are the master's degree, usually master of arts or master of science, and the degree of doctor of philosophy The master's degree is usually obtained for one academic year of graduate work as a minimum, three or more years of study are required for the doctor of philosophy degree Other types of doctoral degrees comparable with the doctor of philosophy are the doctor of science and the doctor of education These degrees should not be confused with the doctor of laws (LL D.), doctor of humane letters (L H D), doctor of letters or doctor of literature (Litt D), doctor of divinity (D D.) and other doctoral degrees which are conferred by colleges and universities as purely honorary distinctions.

Other Services.—Research is an important part of the work of the universities Some of it is carried on by individual faculty members as a part of their effort to improve themselves and gain professional recognition and advancement A considerable part of the research, however, is organized in projects for which funds are appropriated to pay the costs The land-grant colleges and universities maintain agricultural experiment stations, and many colleges of engineering carry on research through their engineering experiment stations. Within a number of universities research institutes have been organized to promote specific types of investigations.

Research in universities is supported from university funds and from funds supplied by foundations, scholarly and professional societies, commercial concerns, state agencies, the federal government and individual donors. The financial assistance takes the form of fellowships and grants-in-aid to mature students and faculty members, and grants and contract payments to the universities. During the year 1949–50 (as an example), $225,341,000 was spent in organized research by higher education institutions

Research in universities results in the preparation of many scholarly and scientific articles, monographs and books. To facilitate publication of such materials a number of institutions, beginning with Cornell university in 1869, established university presses In addition to books, these presses publish a number of scholarly periodicals.

Many universities extend their educational services to persons who cannot go to the institution for regular residence instruction These services are usually grouped under the category of extension work (see UNIVERSITY EXTENSION), which includes home-study or correspondence courses, extension classes, short courses and various minor activities The co-operative agricultural and home economics extension work carried on by the land-grant colleges and universities is supported partly by the federal government

Statistical Data.—The *Education Directory* for 1951–52, published by the United States office of education of the Federal Security agency, listed 1,859 institutions of higher education in the United States Of this number, 209 bore the name university, but perhaps one-third of these were universities in name only and should more appropriately be called colleges

In the fall of 1951 the enrolment in institutions of higher education was 2,116,440. Of this number, 1,017,812 students were enrolled in 130 universities. (Universities, as defined by the office of education for statistical purposes, are "those institutions of large and complex organization in which several professional schools and colleges, not exclusively technical, are incorporated within the administrative framework of the institution.") The other 1,098,628 students were enrolled in smaller universities and liberal arts colleges, teachers colleges, institutes of technology, technical institutes and other institutions. The largest enrolment in one institution was 45,186, 30 universities and colleges enrolled more than 10,000 each. Graduate students comprised approximately 9% of the enrolment. The numbers of earned degrees conferred by all higher education institutions during the academic year 1950–51 were· bachelor's and first professional, 384,352; master's and second professional, 65,132; doctor's, 7,338.

The amount expended in 1949–50 by all higher education institutions for educational and general purposes, including research but not including expenditures for plant expansion and for non-educational purposes, was $1,706,444,000. At many of the institutions the expenditures ran into millions of dollars; as examples: the University of Illinois, $41,784,000, The University of Chi-

cago, $42,542,000; the University of Minnesota, $35,040,000.
(L. E Bit)

SOUTH AND CENTRAL AMERICA

The achievement of independence by the Latin-American states was, in some instances at least, accompanied by measures of educational reform. Between 1821 and 1832 nine universities were founded or refounded and survived the many and grievous troubles which wracked the continent throughout the 19th century.

In Peru, Trujillo (1824), founded by Simón Bolívar; Arequipa, raised in 1827 from academy to university status; and Cuzco (founded 1696), which was in the same year transformed from an ecclesiastical to a lay foundation and made open to all, became centres of considerable intellectual activity. In Colombia the foundation of the University of Antioquia at Medellín in 1822 was followed by those of Cartagena (1824) and Popayán (1827). In Argentina arose Buenos Aires (1821), and in Bolivia, La Paz (1831) and Cochabamba (1832). Round the mid-19th century there was a second cluster of foundations The University of Montevideo in Uruguay dates from 1849, though it became important only when a medical school was added in 1876. In 1843 the University of Costa Rica was founded at San José, and in 1867 the University of Cuenca in Ecuador. In 1842 the century-old University of Havana was reorganized; its subsequent history for 60 years was unhappy, until in 1900 it was refounded with U.S. aid In 1843 the University of Santiago in Chile (1738) was nationalized, as was also in 1856 that of Córdoba in Argentina (1613). The closing years of the century were also marked by new foundations. La Plata (1890) in Argentina (to be reopened in 1905–08 under the auspices of the University of Philadelphia), the Catholic University of Chile in Santiago (1888), the National University of Paraguay at Asunción (1889) and the University of Guayaquil in Ecuador (1867) among others.

THE FAR EAST

China.—Until nearly the end of the 19th century public education in China consisted almost entirely of study of the classical texts. But some education on western lines had been introduced nearly half a century previously. In 1852 Roman Catholic missionaries founded a college to train Chinese as priests Protestant missions followed suit, and Americans in particular began to found institutions of university status which were open to all Meanwhile, in 1861, the government opened two colleges, at Peking and Canton, for the study of foreign languages, and about 25 years later began to send young Chinese abroad to foreign universities. In 1902, after the Boxer rising, the government embarked on *thoroughgoing educational reform* and in the same year founded the National University of Peking, incorporating in it the foreign-language colleges. By 1910 an imperial university had been established, in name at least, in every one of the 18 provinces.

Japan.—On the reopening of communication with the west Japan began eagerly to absorb western learning. In 1857 the government founded "a place for studying foreign books" and a "school for acquiring foreign medical art." To these in 1862 a college for the study of European science was added In 1871 a system of compulsory education was introduced, and in 1877 the Imperial University of Tokyo was founded. By 1910 three other universities (all much smaller) had been established· Kyoto (1897), Tohoku (1907) and Kyushu (1910).

WORLD WARS I AND II AND AFTER

The years following 1914 saw a huge increase in the number of universities. Excluding the U.S, about 250 new foundations had been recorded by 1952, or rather more than one for every two universities functioning in 1914. During the same period new faculties, schools and research institutes were added in profusion at both old and modern universities, and the numbers of students and staff multiplied at an unprecedented rate. Yet by 1950 the demand for admission was hardly anywhere satisfied, and in many countries vastly exceeded the available places.

It would be wrong to attribute this amazing growth solely, or even largely, to the effect of two world wars, though each of these undoubtedly proved a powerful stimulant. The growth derived from forces set in motion long before the outbreak of World War I, forces which were working themselves out in a world-wide social and economic revolution.

China.—By far the largest increase in the number of universities took place in Asia Including those in the U.S S.R., there were about 150 new foundations. Of these, a quarter or more took place in China. There, in 1912, a universities law was passed making the college of liberal arts and sciences the nucleus of the university, whose purpose was declared to be "to cultivate scholars and prepare men for the service of the state." By 1925 there were said to be 47 institutions of university status in China, and by 1937 (when Japan attacked China), 108. Probably fewer than half of these, however, would have qualified as universities in the ordinarily accepted sense of that term. An estimate made in 1938 spoke of China's 47 universities.

Between 1937 and 1945 China wrote an immortal chapter in the history of the university Many of the major institutions were situated in coastal areas that were early exposed to the full blast of invasion. Their buildings destroyed, damaged or occupied, staffs and students migrated westward, carrying with them what they could of books and equipment. More than 80 institutions are said to have thus sought security during the first year of the war, during the following seven, many universities were compelled to move again and again, usually on foot and often across mountainous territory. They suffered terrible privations and had to pursue their studies with little or nothing even of essential materials; but they held on. Academic standards inevitably deteriorated When hostilities ended, arrangements were made by the government for the universities to return to their original homes, and between May and October 1946 about 60 institutions, with more than 60,000 students, were moved back. Scarcely had this happened before the tide of war began to flow over them again, to culminate in 1949 in the complete occupation of continental China by the Communists Within the following three years all universities and colleges owned or administered by foreigners had been closed or absorbed into a nationalized system of higher education.

Japan.—Between 1920 and 1945 about 35 universities were founded in Japan These were of three kinds imperial, other state universities and private. The imperial universities had several faculties, the "government" universities one only. The private universities, about 25 in all, were about half and half multiple- and single-faculty institutions; most of them maintained their own preparatory schools to ensure a steady flow of entrants

During World War II the buildings of two-thirds of the universities were destroyed or badly damaged In 1947, following advice from a U.S education mission, the diet passed a school education law which provided for a four-year university system after the U.S. pattern. Under this all institutions for higher education which could satisfy the standards prescribed by the University Accreditation association (founded for the purpose) were to be organized into about 220 "new-type" universities—70 government, 20 public and 130 private

India.—In India, following the government's 1913 resolution, universities were founded at Benares (1916) and Patna (1917), the former specifically to develop Hindu culture. Almost simultaneously two universities were started in Indian states, at Mysore (1916) and Hyderabad (1918), the latter, Osmania university, adopting Urdu, the official language of the state, as the medium of instruction. Between 1917 and 1919 the whole organization of higher education in India was exhaustively examined by the government's Calcutta University commission Little change ensued at Calcutta, but from the recommendations sprang eight new universities in ten years. the Moslem university of Aligarh (1920), Lucknow (1920), Rangoon (1920), Delhi (1922), Nagpur (1923), Andhra (1926), Agra (1927) and Annamalai (1929). During these years Bombay, Madras and Allahabad were reconstituted. During the 1930s only one university was founded, at Travancore (1937), but in 1943 another succession began which resulted in Utkal (1943), Saugar (1946), Rajputana (1947), Gauhati (1947), Poona (1948), Roorkee (1948), Kashmir (1948) and Baroda (1949).

Pakistan.—On the creation in 1947 of the dominions of India and Pakistan, the University of the Punjab (1882) became two universities. West Punjab in Pakistan and East Punjab in India. The former became the University of the Punjab. The University of Dacca (1921), previously unitary, became affiliating. The University of Sind (1947) was founded just before partition, and universities were later established at Peshawar (1950) and at Karachi (1952).

Ceylon.—In Ceylon the University college (1921) and the Medical college (1870) amalgamated to become in 1942 the University of Ceylon, which in 1952 moved into new buildings near Kandy.

Others.—In 1949, following the report of a commission sent from England, the University of Malaya was founded by the amalgamation of Raffles college (1928) and the King Edward VII College of Medicine (1905). During the years after 1914 universities were also founded in Afghanistan (1946), Java (1947), Iran (1934), the Philippines (seven between 1921 and 1948), Siam (four between 1917 and 1943) and Turkey, at Ankara (1946) and Istanbul (1944), the latter a technical university. Special mention must be made of the Hebrew University of Jerusalem, begun in 1918 and formally opened by Lord Balfour in 1925, which became the world centre of Jewish culture.

U.S.S.R.—Detailed information about the U.S.S.R., especially about later developments, has to be derived largely from secondary sources. During the revolutionary period (1917–20), many of the republics founded national universities. Between 1922 and 1932 the Russian S.F.S.R. and other republics broke up their universities into separate specialist institutes, but the sharp lowering of standards of general culture led in 1932 to a reversal of this policy. The universities were reconstituted, at first with scientific faculties only, to which between 1934 and 1948 the humanities and law were added. During World War II many universities in the west were destroyed or seriously damaged, as they were freed from German occupation they were restored. In 1950 there were said to be about 30 universities in the U.S.S.R. All were state-owned and controlled and all similarly governed and organized.

EUROPE

Both World Wars I and II temporarily checked university studies and development, World War II far more disastrously than World War I. Apart from widespread material damage—worst of all perhaps in Germany—it was German policy in all the countries which were occupied to transform the universities into purely nazi institutions. Everywhere the policy, however savagely applied, met with determined resistance, overt or underground. In Poland, where the execution and internment in concentration camps of teachers and students probably reached the limit of ferocity, the Poles formed a secret department of education and culture and organized in Warsaw a "free Polish university" which enabled students to study and sit for degrees. By 1943–44 this had 2,000 registered students and was providing instruction in a score of subjects. In the Netherlands, where the universities of Leyden, Amsterdam and Nijmegen were closed, 80% of students refused to sign a declaration of compliance with nazi desires, and went underground. In Norway the University of Oslo was closed in 1942, when 700 students were arrested and deported. Many students escaped into Sweden, which received refugees also from Denmark, Finland and the Baltic states and organized courses and examinations for them. An international university students' committee formed in Sweden helped to keep prisoner of war camps in Germany—some of which organized "universities"—supplied with books, paper and other materials essential for study.

There was a remarkable similarity between processes of recovery after World Wars I and II, though that after the latter, having to rise from far greater depths of desolation, was on a much larger and more heroic scale. First, both wars, especially the second, stimulated the desire for increased facilities for secondary and higher education. As a result, universities everywhere were overwhelmed with applicants and overcrowded to the breaking point. Second, both wars, but again especially the second, impressed upon the nations the necessity for widespread technological and administrative proficiency; consequently there was a rapid development of specialist institutes, for both teaching and research, mainly within or attached to universities. New faculties and schools arose in equal profusion: in the applied and social sciences, agriculture, commerce and the fine arts. Third, the wars emphasized—unsuccessfully after World War I—the urgent need for international co-operation at the university level. Cultural conventions between nations facilitated the exchange of teachers and students for shorter or longer periods. This development was particularly widespread after World War II, being stimulated not least by the Fulbright agreements. International conferences, courses and summer schools proliferated, being encouraged after World War I by the League of Nations and organized by such bodies as the Institute of International Education in New York city, and after World War II by the United Nations Educational, Scientific and Cultural organization and, for example, the Association of Universities of the British Commonwealth and the British council.

Curiously, neither war led to much foundation of new universities, except in eastern Europe. After World War I, several were set up in the newly established states of Czechoslovakia, Finland, Poland, Rumania, Yugoslavia and the Baltic republics; elsewhere, except in Italy under the Mussolini regime, only an evolutionary development took place, illustrated, for example, by the promotion of Reading (1926) in England and the foundation of Hamburg (1919) in Germany. After World War II there was a similar but smaller outcrop in the east, chiefly in Poland and Rumania. For political reasons Berlin acquired three new universities. The British raised the famous Charlottenberg Institute of Technology to university rank (1946), the Americans founded the Free University of Berlin (1948) and the Russians the University of Potsdam (1948). The French reopened the ancient University of Mainz (1946), which had been closed for a century and a half. The only other foundations in western Europe were Nottingham (1948) and Southampton (1952) in England and Bergen (1948) in Norway, all three elevations of long-established institutions.

LATIN AMERICA

Brazil.—Brazil and Mexico contributed almost half of the new universities, about 50 in number, founded in South and Central America between 1914 and 1952. Brazil's first university, at Rio de Janeiro, was set up in 1920; 30 years later the country had three national, five state and three Roman Catholic universities. By a law passed in 1931, every university must have a law school, a medical school and either a school of engineering or philosophy.

Mexico.—The rapid growth of universities in Mexico reflected the intensive attention given to public education after the 1910 revolution. In May of that year the ancient Royal and Pontifical University of Mexico (founded 1551) was reorganized as the National University of Mexico. In 1929 it was granted virtual autonomy and became the model for all the state universities, of which there were 11 in 1952. In 1933, students at the state university of Guadalajara went on strike in protest against state control and after a struggle lasting several months forced the government to agree to the foundation of autonomous universities. Thereupon they organized the Autonomous University of Guadalajara, inducing teachers to serve without pay, until the university was recognized in May 1935. In 1943 a women's university was founded in Mexico City as a private institution providing courses in letters, law, science and a long list of special subjects ranging from journalism to nursing.

Colombia.—In Colombia as in Mexico there was a determined effort to raise the general standard of education. A law passed in 1934 decreed that not less than 10% of the government's revenue was to be expended on education. Within the next six years four new universities had been set up, and by 1950 there were altogether ten in the country, one national, five departmental and four private. All enjoy considerable autonomy, though all must conform to the statutes of the National university at Bogotá.

Other Nations.—Universities were also founded after 1914 in Argentina, Bolivia, Chile, Costa Rica, Ecuador, Haiti, Nicaragua,

Panamá and Peru.

Cuba and West Indies.—Between 1946 and 1948 Cuba increased the number of its universities from one to five in 1946 the Catholic university, Havana, the first private university in the republic, was approved by the church; in 1947 and 1948, respectively, the universities of Oriente and Santa Clara were founded, and in 1947 the Junior college of the Havana Business academy, a privately owned institution, became a university and independent of the parent body.

Following the passing of the Colonial Development and Welfare act, 1940, the British secretary of state for the colonies appointed in 1943 a commission to consider the principles which should guide the promotion of higher education, learning and research and the development of universities throughout the British colonies A delegation sent by this commission to the West Indies recommended that a university be established there at the earliest possible date The British government undertook to provide the capital funds for its establishment and the West Indian colonies the income for maintenance A principal was appointed in 1946, and in 1948 the medical faculty of a university college of the West Indies opened, working under the aegis of the University of London In 1949 the science faculty was added, in 1950 that of arts. The site of the college, near Kingston in Jamaica, was donated by the Jamaican government. Construction of permanent buildings began in 1949.

AFRICA

Union of South Africa.—After long discussions on the replacement of examining by teaching universities, the South African parliament in 1916 passed three acts whereby the University of the Cape of Good Hope became the University of South Africa, with headquarters at Pretoria; the South African college became the University of Capetown; and the Victoria college, Stellenbosch, became the University of Stellenbosch. In 1922 the University college, Johannesburg (formerly the Kimberley School of Mines), became the University of the Witwatersrand; in 1930 Transvaal University college became the University of Pretoria; and in 1948 Natal University college the University of Natal. In 1945 the Pius XII Catholic University college at Roma in Basutoland was founded, the first Roman Catholic university establishment for Negroes in the world.

Development in Tropical Africa.—In 1945 the Commission on Higher Education in the British Colonies urged that university colleges should be established as soon as possible in British West Africa and that Makerere college, Uganda, be developed to full university status. In accordance with these recommendations, university colleges were established in Nigeria and the Gold Coast in 1948, and Makerere college was upgraded to university college status in 1950.

AUSTRALASIA

Australia.—In 1930 Canberra University college was constituted, "pending the establishment of a teaching university in Canberra" Its function was to provide courses for degrees in cooperation with one or more of the existing universities In 1946 the commonwealth parliament passed the Australian National University act to establish at Canberra a university providing especially for postgraduate study and research. Building began in 1949. By 1952 all its four research schools (medicine, physical sciences, social sciences and Pacific studies) were at work.

In 1947 the New South Wales government set up a development council to create a university providing facilities for undergraduate, graduate and research study in technical subjects. The New South Wales University of Technology began work in March 1948 and was incorporated by the state parliament in April 1949.

New Zealand.—In 1926 the University of New Zealand became a federal body including four constituent colleges (Otago, Canterbury, Auckland, Victoria) and two associated agricultural colleges. (J. B. Mu.; C. Br., H. C. D.)

UNIVERSITY ARCHITECTURE. The earliest universities, such as Paris, Bologna, Prague, Salamanca and others, were established in towns, and it is with the buildings of the towns that the universities grew and became mingled. They were often housed under the protection of religious establishments in monastic and church buildings, and, if under secular control, in old palaces or other structures hired or lent by the civil authorities and not always planned for the purposes of the university.

Continental European Universities.—Nearly all univer-

sity structures on the Continent of Europe are Renaissance; the remainder are classic in style. Exigencies of the site, such as land values and density of the surroundings, have in many cases imposed a form of building with a closely knit plan entirely occupying a city block Uninterrupted exterior walls correspond with the street building lines Within are one or more courts providing light and air. These courts are usually surrounded by a colonnade which gives access to the various rooms. An example of this type is the Sorbonne (Nerot, architect; 1885–1900) Where the site is sufficiently open the U- and H-shaped plans or a combination of these are found. An imposing group of university buildings laid out in modern style is at Strasbourg Other universities of a modern type are to be found at Vienna (Ferstel, architect; 1885), Uppsala, Munich, Bucharest, Budapest.

Oriental Universities.—The University of Cairo resembles a mosque (*q.v.*). At the imperial University of Peking new buildings influenced by western design are taking the place of the native one or two-storey structures of gray brick, built about small square courts, opening into each other through broad gateways, and said to have been originally palaces. The 50 buildings of the modern University of Tokyo indicate the influence of German universities, and like them provide for education in the sciences

South American Universities.—University buildings in South America invariably contain one or more courts or patios, from the galleries of which the surrounding rooms are entered The exteriors are in the Renaissance style as taught at European architectural schools—notably those of France—and found in modern buildings of that country and of Spain. Mansard roofs are much in favour for buildings upon a large and pretentious scale, and abundant ornament characterizes both interiors and exteriors Of this order are the National University of Mexico at Mexico City, the university buildings at La Plata, Argentina, the University of Montevideo, Uruguay, and the Catholic university at Santiago, Chile.

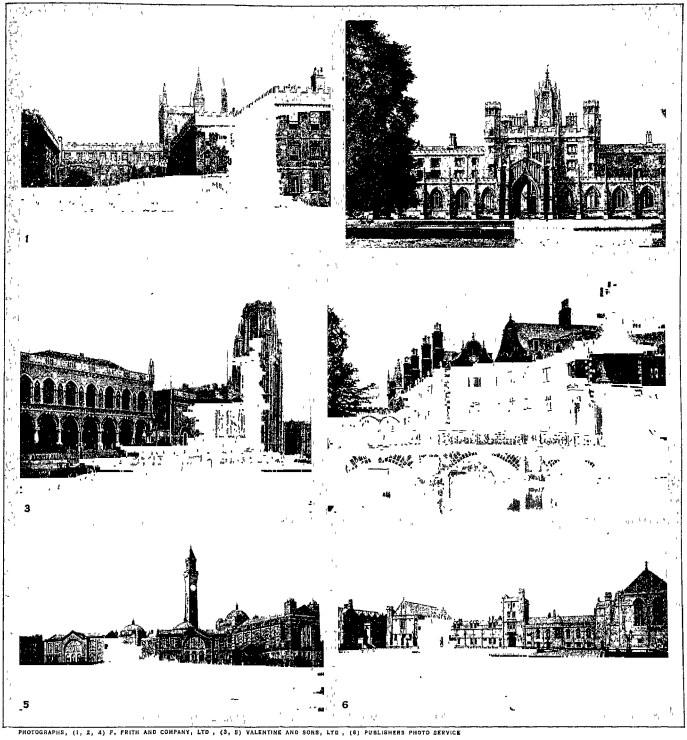
English Traditional Type.—Oxford and Cambridge typify the English university system, and are so singularly venerable and traditional that, in the English-speaking world, their names are almost synonymous with the word university The congeries of buildings that grew up at Oxford round the University Church of St. Mary and the Schools, consisted first of halls, which were scarcely more than inns or hostels for the students, that is to say, rows of separate dwellings, each with its entrance on the side away from the street and each independent of its neighbour. Later the colleges were erected, each sufficient unto itself, with its own chapel and antechapel, library, masters' lodge and hall, common room, student lodging, dining hall (commons), kitchen, buttery, bake-house, brew-house, cellars and other offices. Additional rooms were contrived later in the attics, by means of roof and wall dormers, additional storeys and by additional colleges. The early colleges were so constructed as nearly to enclose a quadrangular sequestered space.

These establishments epitomize the history and development of the national styles ranging from the monastic period through the centuries marked by the Perpendicular, Tudor, Elizabethan, Jacobean and Modern styles. In spite of their variations, the oldest of the colleges have in common an architectural character that has been designated the English Collegiate Gothic style. The old English universities dominate the town and yet defer to it in so far as the architectural boundary lines conform to the streets, none of which are rectilinear. Instead of rigidly formal lay-outs or grouping of buildings, there is a happy picturesqueness Modern buildings have, however, made their appearance

The modern Universities of London, Manchester, Liverpool and Birmingham differ radically from Oxford and Cambridge, and being urban, student lodgings play little or no part in their design.

American Universities.—The influence of both English and Continental university architecture is seen in the building for educational institutions which has taken place on a prodigious scale in America during the past 50 years. The earliest foundations to develop with the towns in which they were situated were Harvard and Yale The typical American university, however, differs from these in having, often isolated in rural districts, its own separate domain, the heart of which is the campus (*q.v.*) or college yard The University of Virginia, designed by Thomas Jefferson and dominated by the classic library, is believed to be the first general scheme realized After the period of stagnation of the arts, and following the awakening caused by the Centennial at Philadelphia and the work of Richardson and other pioneers (*see* MODERN ARCHITECTURE: 18th AND 19th CENTURIES), the first university to attempt a comprehensively developed plan was that of Stanford, Cal. (C. A. Coolidge, architect; 1886) Developments on a comprehensive pre-arranged plan are at the University of Illinois, Louisiana State university, University of Rochester, Duke university, Johns Hopkins, Washington university (St. Louis), and the University of Minnesota

The earliest university buildings were designed in the style brought from England by the colonists. New buildings of this character are also found at Harvard, Franklin and Marshall, Rutgers, Delaware, Johns Hopkins and Brown universities At the end of the 19th century, however, a counter-current set in College buildings in English collegiate style having been carried out with measurable success by Cobb at Chicago, Haight at Yale and Cope and Stewardson at the University of Pennsylvania, a predilection for this style arose Curiously enough, this was more pronounced at the American universities where the Colonial tradition was formerly strong, so at Yale and Princeton, for example, Gothic is seen side by side with the traditional colonial



Yet another aspect of the development of university architecture in America is the so-called "sky-scraper" type of building at the University of Pittsburgh (Klauder, architect). That the universities of the U.S. are ready to progress beyond mere eclecticism in the design of their buildings is evinced by the competitions for the Fine Arts building group at Wheaton college (1938), and the Festival Theatre at William and Mary in Williamsburg (1939)

UNIVERSITY COLLEGES. The so-called university colleges in England owe their rise to the desire, in the 19th century, to bring higher education within the reach of the population of certain regions to whom the existing universities were, for reasons of cost or distance, inaccessible. The earliest of such colleges, Owens college, Manchester (opened in 1851), was specifically founded for that purpose, and many of its students were long prepared for the external examinations of London university Subsequently, in Manchester and elsewhere, the technical side was developed. Other similar foundations were the Yorkshire college, Leeds, the New University college, Liverpool, the Mason college, Birmingham, the Firth college, Sheffield. Later on certain of these colleges became affiliated colleges of a single university (*see* UNIVERSITIES), but such colleges, and even others which did not go through the intermediate stage, have now become independent universities, with the exception of Armstrong college, Newcastle, which is still part of Durham university In fact, a university college to-day is regarded as a university in the making The most recent to attain that dignity is Reading, while University college, Nottingham (*see* below) should soon win its charter. (C. BR.)

Exeter.—When the Royal Albert Memorial building was erected in 1865, part of the premises was set aside for educational purposes Here various extension courses provided by the University of Cambridge were instituted. These were co-ordinated in 1893 and the work placed under the direction of a principal At the beginning of the present century courses were developed to prepare students for the external degrees of the University of London. In 1922, the institution was incorporated as the University college of the south-west of England, and its status was recognized by grants from the University Grants committee. It is hoped in time to develop this institution as a university of the south-west of England. In June 1927 the prince of Wales laid the foundation stone.

Hull.—The University college of Hull opened for the first time

in Oct 1928. The college has been established as a result of gifts by the Rt. Hon. T R. Ferrens, amounting to £272,000. The corporation of Hull has also given £150,000 towards the initial building scheme and has resolved to make an annual maintenance grant of £2,500. The policy of the college is to aim at quality rather than quantity. It has, therefore, been decided to begin as only two faculties, arts and science

Leicester.—In 1921 an institution was established to prepare students for the examinations of the University of London under the style of the Leicester, Leicestershire and Rutland college. In 1926 the name was changed to Leicester University college, when the endowment fund had reached a total of £130,000.

Nottingham.—The University college was first opened in 1881, having developed out of courses conducted by the Extension Board of the University of Cambridge. It was housed till 1928 in buildings in the centre of the town, provided by the municipality. Through the generosity of Sir Jesse Boot, an admirable site and a fine building, opened by the King in the year named, have been provided at a cost of over £500,000. An appeal is now being made for an adequate endowment fund The college prepares its students, both in day and evening classes, for the London university examinations in art, science and law. It has a very active University Extension department.

Southampton.—University college was opened as the Hartley institution by Lord Palmerston in 1862. At the outset the work was mostly evening work, by which students were prepared for the examination of the Science and Art department; the day was rather preparatory to university work than of real academic standard. In 1902, under a scheme of the Board of Education, the institution became the Hartley University college, and received a grant from the Treasury. Just before the World War new buildings had been provided at Highfield, but they were not occupied by the college till 1919.

Wales.—*Lampeter.* St David's college, Lampeter, was founded in 1827 to provide a liberal education to persons intended for the Church, especially in Wales. It was subsequently affiliated to Oxford and Cambridge, where its students have special privileges. Under royal charters it has received the right to confer degrees in arts and theology, the examinations being conducted by examiners appointed by Oxford and Cambridge. Residence for a certain number of terms is also essential. (A. E. Tw.)

UNIVERSITY COURTS, in the English universities of Oxford and Cambridge, courts of inferior jurisdiction, administering the form and procedure of the canon law.

At Oxford the chancellor, in 1244, acquired jurisdiction over actions of debt and actions affecting movables in which one party was a clerk; in 1275 over all personal actions in which either party was a member of the university, and in 1290 over all crimes, except homicide and mayhem. The chancellor, vice-chancellor and the vice-chancellor's deputy are justices of the peace for Oxford, Oxfordshire and Berkshire, where scholars are concerned, and so exercise jurisdiction under the Summary Jurisdiction acts By the Oxford University act 1854, the procedure of the common law was substituted for that of the canon law.

At Cambridge the chancellor enjoyed a jurisdiction similar to that of the Oxford chancellor, but limited to cases arising in the town and suburbs of the university Previous to 1891, women of light character, who had been convicted of consorting with or soliciting members of the university *in statu pupillari*, were detained in a house of correction called the "spinning house," but in that year a conviction was held bad (*ex parte Hopkins* [1891]), with the result that the clause in Elizabeth's charter of 1561 giving power to imprison women was repealed. *See* H. Rashdall, *Universities of Europe in the Middle Ages* (1895); D. S. Holdsworth, *Hist. Eng. Law* (1921). (H. H. L. B.)

UNIVERSITY EXTENSION, a term applied to the provision of lectures or other teaching by universities for the general public, not members of the university.

Great Britain.—The idea of extending the range of advanced teaching beyond the walls of the universities was not a wholly new one in the 19th century, but it was not taken up with pertinacity till the early '70s. At that time a young Fellow of Trinity, James Stuart, approached his own university of Cambridge for the recognition of extra-mural work. He had been specially impressed with the needs of two classes who had sought his help—the working men of Crewe and an association for the higher education of ladies in the north of England Cambridge gave its official support in 1873 and Mr. (afterwards Professor) Stuart developed a system, not merely of lectures, but of classes.

Before long Oxford followed suit and a London society was formed which has since been absorbed by the University of London. The old Victoria university (Manchester, Liverpool, Leeds) took its share of the work.

Before the end of the century every large town in England and most small ones had a university extension centre, the subjects studied including history, geography, literature, art, music, science, economics. Since then the older type of extra-mural work, called officially university extension at Oxford and London and university local lectures at Cambridge, has continued to advance. Even during the World War a large number of courses were delivered.

The period since the war has shown a remarkable development of university tutorial classes, begun by Oxford in 1908 and soon taken up by other universities. The system, like the older type, provides for lectures, discussion classes and paper work; but the membership is limited to a small number, formerly 32 and now 24, of students pledged to fulfil the conditions for three years. In 1910–11 the number of classes was 72 and students 1,829; in 1927–28 these had increased to 591 and 10,778 respectively. In addition there were 83 preparatory classes with 1,709 students. Substantial grants in aid are made by the Board of Education and local authorities.

The central joint advisory committee on tutorial classes, formed in 1909, was one of the first bodies to represent all the universities and university colleges in England and Wales. It also has direct representation of the joint committees which manage the work in each case, and which include members nominated by the Workers' Educational Association In 1925 a consultative committee was formed, consisting of all the extra-mural officials It is concerned with all branches of the movement and not only with the tutorial classes. At the congresses of universities of the empire, held in 1912 and 1921, a prominent place was given to teaching work outside the walls The tutorial class movement has flourished in Australia and New Zealand

Every university and university college in England and Wales is now conducting tutorial classes. Several have started university extension work of the older type, a development which has been made possible by the issue in Aug. 1924 of new regulations of the Board of Education in providing for grants in aid

One of the most promising developments is the plan, recommended by the royal commission, of bringing up to the university adult students who have gone through a course of extra-mural instruction. At both Oxford and Cambridge a number of such students are now in residence for at least a year, and experience is already showing that, besides widening their own outlook, they contribute an element of great value to the undergraduate life of the places. All will return to their homes with powers of greater service to the community, and many will become valuable teachers in the adult education movement (*See also* ADULT EDUCATION)

Parry, *Cambridge Essays on Adult Education* (1920); *Reports* of the Adult Education Committee appointed by the president of the Board of Education. (D. H. S. C.)

The United States.—To trace the history of university extension in the United States to any definite initial movement is impossible It grew out of the public demand for the extension of the advantages of the university to the community in general. A hint of the desire to broaden the service of higher education may be found in the series of lectures open to the public for a small fee offered by Columbia college at its original site in College Place, New York, in 1830. This was premature and failed to arouse interest. We may refer also to the American National lyceum founded in 1831, the Lowell Institute in Boston (1839), the Peabody Institute in Baltimore (1859), all having features of univer-

sity extension particularly of the lyceum (*see* LYCEUMS AND CHAUTAUQUAS) or short lecture course type Then the summer school (*q.v.*) was organized at *Chautauqua* in 1874 which through its literary and scientific circles developed a form of correspondence study. The next incident in the development centred around the public libraries in such cities as Chicago and St Louis, for it was at the meeting of the American Library Association in Sept 1887, when Prof. Herbert B. Adams of Johns Hopkins university spoke on the university extension of England. Extension work under the auspices of public libraries was endorsed and earnestly advocated by Melvil Dewey, librarian of Columbia university, before the regents of the University of the State of New York in 1888. In 1890, when Mr. Dewey had become the librarian of the State library of New York, the regents following his suggestion, endorsed by 31 colleges of the State, determined to establish a system of university extension and obtained from the legislature an appropriation of $10,000 for administrative expenses.

The University of Chicago and the University of California, 1891–92, were pioneers in the acceptance of extension instruction in their scheme of university study. Thus naturally led to the gradual disbanding of organizations established outside of the universities. The first 20 years of the 20th century witnessed the organization of extension teaching in at least 30 State universities Only a few institutions which rely largely upon private endowment—as Columbia university (1902 and 1910), New York university (1908), University of Rochester (1916), Syracuse university (1920) and University of Pennsylvania (1913)—have included university extension as part of their public service in education.

Early Forms of University Extension.—As in England so in the United States the early form of university extension was that of the lyceum or short lecture course, not too profound, often illustrated, intended to entertain as well as to instruct Although the short lecture course served a useful purpose, yet the lyceum as a means of education, with its difficulty of maintaining a balance between the serious and the entertaining, proved unsatisfactory It became necessary to approximate much more closely the form of instruction followed in the established schools and offered to students in regular attendance. Those who could not attend classes were given courses by correspondence (*see* CORRESPONDENCE SCHOOLS), which assumed a more or less academic form and exactness, and classes were established at convenient centres and in university buildings. The large universities of the West, *e g*, the University of Chicago and the University of Wisconsin, built up great departments of correspondence although using class instruction in a restricted degree.

Credit for Extension Courses.—Certain privately endowed universities and colleges, particularly those in the East, have believed that their special function would be jeopardized if they should supplement their classes by those intended for the irregular student. Thus Princeton gives no indication of a desire to enter this field Yale is cautious in its active interest in adult education. Harvard co-operates with Tufts college, Massachusetts Institute of Technology, Boston university and Wellesley college in offering courses of a collegiate grade to qualified, though not formally matriculated, students. Massachusetts has a well organized department of university extension. As to credit toward degrees for extension students the policy varies in different institutions. The State universities in the West generally grant credit for class and correspondence courses. Columbia gives credit for established class instruction but not for home study. Harvard grants credit in co-operation with other institutions toward a special degree of A.A., associate in arts.

The National Association of University Extension is an organization of universities and colleges which have established departments of extension teaching. This was organized in 1914 and publishes annual reports which contain the records of meetings of the association. The American Association for Adult Education held its first annual meeting at the Hotel Drake in Chicago, on March 26, 1926. The latter organization is a most active agent for the study and extension of adult education. In 1926–27, under the auspices of the Carnegie Corporation, four studies covering the field of adult education were published. One of these entitled *The University Afield*, by Alfred L. Hall-Quest (1926), is a carefully prepared examination of educational opportunities offered by American universities in university extension.

UNIVERSITY SETTLEMENT: *see* SOCIAL SETTLEMENTS.

UNRUH, FRITZ VON (1885–), German dramatist, novelist and poet, was born in Coblenz of an aristocratic Silesian and Prussian family. He joined the Prussian Guard, but resigned his commission in 1912 when his first play, *Offiziere* (*Officers*) met with great success. His *Opfergang* (1916; English tr. 1928, *Way of Sacrifice*), which is the first written description of the battle of Verdun, expressed his revolt against militarism. His trilogy *Ein Geschlecht* (1918–21) was also impressionist The later *Flugel der Nike* (1924), *Heinrich aus Andernach* (1925), and *Bonaparte* (1926; English tr. 1928) were still expressive of revolt but they had lost some of the wildness, and with it some of the force of *Opfergang*. Other works include *Louis Ferdinand, Prinz von Preussen* (1914), *Rosengarten* (1922), *Politeia* (1933), *Charlotte Corday* (1935) and *Gandha* (1936). Unruh was a member of the Prussian Academy of Letters from 1928 until 1933. He moved to France in 1933 and to America in 1940

UNTERMYER, SAMUEL (1858–1940), American lawyer, was born at Lynchburg (Va), on June 6, 1858. He was educated at the College of the City of New York and at the Columbia law school, and was admitted to the bar in 1879, practising thereafter in New York city. He was counsel in many celebrated cases covering almost every phase of corporate, civil, criminal and international law. As counsel for H. Clay Pierce he prevented the Standard Oil Co., after its dissolution in 1910, from dominating the Water-Pierce Company. In the same year he effected the merger of the Utah Copper Co. with the Boston Consolidated and the Nevada Consolidated Cos., involving more than $100,000,000. In 1903 he undertook the first judicial exposure of "high finance" in connection with the failure of the U.S. Shipbuilding Co., organized as a consolidation of the larger shipbuilding companies in America After this he conducted a number of similar exposures. In 1911 he delivered an address entitled, "Is There a Money Trust?" which led the following year to the so-called Pujo money trust investigation by the committee on banking and currency of the Federal House of Representatives. Mr Untermyer urged measures like the compulsory regulation of stock exchanges, reform of the criminal laws and the regulation of trusts and combinations. He took part in preparing the Federal Reserve Bank law, the Clayton bill, the Federal trade commission bill and other legislation curbing trusts He was a delegate to Democratic conventions and a strong supporter of President Wilson, who appointed him to serve on the commission which sat at Buenos Aires in 1916 to frame uniform laws for the Pan-American countries.

Untermyer acted for Governor Smith in a water-power controversy over the Niagara, St. Lawrence river, Adirondack forest reserve and other hydro-electric power rights, resulting in the defeat of the grant of the water-power rights of the State to private interests. He was counsel for Herman Bernstein in the first suit brought against Henry Ford because of attacks on the Jewish people published in the *Dearborn Independent*. In July 1927, Mr. Ford agreed to destroy the publications.

UNTERWALDEN, a canton of Switzerland, consisting of the basins of two streams, both called Aa, flowing into the Lake of Lucerne and divided into Obwalden and Nidwalden. The area of the canton is 296.4 sq.mi. Forests cover about 85 sq.mi. and glaciers occupy over 5 sq.mi. The highest point is the Titlis—10,627 ft.—south of Engelberg. As Obwalden includes this region, it is generally more mountainous than Nidwalden. The latter in-

cludes much more lake surface than Obwalden. The inhabitants are devoted to pastoral and, in a much less degree, to agricultural pursuits. In 1941 the total population was 20,110 in Obwalden and 17,346 in Nidwalden, and in 1950, 22,125 and 19,389, respectively, mainly German-speaking Catholics. The capital of Obwalden is Sarnen (pop., 1950, 6,199); and of Nidwalden, Stans (3,992).

There are no main line railways; a light railway runs from Lucerne to Brünig pass via the Sarner-Aa valley; an electric railway from Stansstad ascends the other main valley as far as Engelberg, and mountain railways give access to the summits of Pilatus, Stanserhorn, Bürgenstock and Seelisberg Each area forms a single administrative district, with its own independent local institutions, in Obwalden there are 7 communes and in Nidwalden 11 In each "half" canton the legislature is composed of 32 (Obwalden) and 58 (Nidwalden) members respectively, elected for 4 (Obwalden) or 6 (Nidwalden) years by all male citizens of voting age

The people have always been deeply religious. In the church of Sachseln, on the Sarnersee, still lie the bones of the holy hermit, Nicholas Lowenbrugger (1417–87), known as Nicholas von der Flue, or "Bruder Klaus," while at Sarnen, near by, are several convents; the most famous of all the monasteries in the canton is the great and still wealthy Benedictine house of Engelberg (founded about 1120). Another site of historical interest is Stans, the birthplace of Arnold von Winkelried, the real or legendary hero of Sempach (1386).

History.—Historically, both Obwalden (save a small area in the Aargau) and Nidwalden were included in the Zürichgau. In both there were many great landowners (especially the abbey of Murbach and the Habsburgs) and few free men; while the fact that the Habsburgs were counts of the Aargau and the Zurichgau further delayed the development of political freedom. Both took part in the risings of 1245–47, and in 1247 Sarnen was threatened by the pope with excommunication for opposing its hereditary lord, the count of Habsburg. The alleged cruelties committed by the Habsburgs do not, however, appear in history until Justinger's *Chronicle*, 1420. On April 16, 1291, Rudolph, the future emperor, bought from Murbach all its estates in Unterwalden, and thus ruled this district as the chief landowner, as count and as emperor. On Aug. 1, 1291, Nidwalden (Obwalden is not named in the text of the document, though it is named on the seal appended to it) formed the "Everlasting League" with Uri and Schwyz (this being the first known case in which its common seal is used). In 1304 the two valleys were joined together, and in 1309 Henry VII confirmed to them all the liberties granted by his predecessor. This placed Unterwalden on an equal political footing with Uri and Schwyz, and as such it took part (1315) in Morgarten fight, in the renewal of the Everlasting League at Brunnen (1315), at Sempach (1386), and in driving back the Gugler or English free-booters (1375).

For physical reasons, it was difficult for Unterwalden to enlarge its territories Yet in 1368 it acquired Alpnach and in 1378 Hergiswil. Also Obwalden shared with Uri in the conquest of the Val Leventina (1403) and in the purchase of Bellinzona (1419), as well as in the loss of both (1422). It was Nidwalden that, with Schwyz and Uri, finally won (1500) and ruled (until 1798) Bellinzona, the Riviera and the Val Blernio; while both shared in the conquests of the Aargau (1415), the Thurgau (1460) and Locarno, etc. (1512), and in the temporary occupation of the Val d' Ossola. In the Burgundian war Unterwalden, like the other Forest cantons, long hung back through jealousy of Bern but came to the rescue in time of need. In 1481 it was at Stans that the confederates nearly broke up the league for various reasons; and it was only by the intervention of the holy hermit, Nicholas von der Flüe, that peace was restored and the great federal agreement known as the compact of Stans concluded. Like the other Forest cantons, Unterwalden clung to the old faith at the time of the Reformation, being a member of the "Christliche Vereinigung" (1529) and of the Golden league (1586)

In 1798 Unterwalden resisted the Helvetic republic, but, having formed part of the short-lived Tellgau, became a district of the canton of the Waldstätten. Obwalden submitted at an early date, but Nidwalden, refusing to accept the oath of fidelity to the constitution, rose in revolt (Sept. 1798) and was only put down by the arrival of 16,000 armed men. In 1803 its independence as a canton was restored, but in 1815 the refusal of Nidwalden to accept the new constitution resulted in the transfer (1816) to Obwalden of the abbey lands of Engelberg.

UNTON (or **UMPTON**), **SIR HENRY** (*c.* 1557–1596), English diplomatist, was the second son of Sir Edward Unton, or Umpton, of Wadley, Berkshire, his mother, Anne, being a daughter of Edward Seymour, duke of Somerset. Educated at Oriel college, Oxford, Unton became a member of parliament in 1584 and served with the English forces in the Netherlands in 1585 and 1586, being present at the skirmish of Zutphen. In 1586 he was knighted. In 1591, through the good offices of the earl of Essex, he was sent as ambassador to Henry IV of France, he became friendly with the French ruler and accompanied him on a campaign in Normandy before he was recalled to England in June 1592 Again securing a seat in parliament he lost for a short time the favour of Queen Elizabeth, however, in 1593 he went again as ambassador to France He died in the French camp at La Fère on March 23, 1596; a collection of verses published in his memory during the same year was edited by his chaplain, Robert Wright, afterwards bishop of Lichfield and Coventry. An interesting picture of Unton hangs in the National Portrait gallery and many of his official letters are in the British museum and in the Public Record office, London

UNTOUCHABLES, members of certain Indian castes which, though reckoned as Hindus, were excluded from the ordinary social and religious privileges of Hinduism. Under the constitution adopted by the Indian constituent assembly Nov 26, 1949, "untouchability" was outlawed and persecution of untouchables made punishable by law. In Pakistan the constituent assembly accepted a similar statement in 1950.

How this caste came to be pushed out of, or never admitted within, the pale is obscure. Probably in the main they represented Dravidians of the lower orders, relegated to menial or unsavoury occupations; they must not be confused with the non-Hindu animists, the wandering and criminal tribes and the pre-Dravidians of the hills and forests. A mistaken aggregation with these latter sometimes led to their numbers being taken at 60,000,000 The population of untouchables proper seems to have been nearer 40,000,000. They are best defined as Hindus who were not allowed to enter ordinary Hindu temples and who supposedly caused pollution to ordinary Hindus either by touch or by proximity. The Brahman would not officiate at the events in life at which, in the case of other castes, his attendance was essential The untouchables were compelled to live either in hamlets or wards of their own or in separate quarters, generally the unsanitary outskirts, of the villages. They could not use the village well, and there was always opposition to their children attending the village school The indignities they suffered varied in different parts of India, being the worst in the south, where a fantastic code regulated the distance an untouchable must maintain from a high-caste Hindu on the public roads and the warning he must give of his approach.

During their persecution, large numbers of untouchables adopted the religions of Islam or Christianity. (ME.; X.)

UNYAMWEZI, a region in Tanganyika, roughly coinciding with the Tabora district of the Western Province of Tanganyika, is situated on a plateau between 3,500–4,100 ft. above sea level. The average maximum temperature is 83° F. and the minimum 62°.F. The region, which is well-watered, is lightly forested and covered with tall grass. The town of Tabora (*q.v.*), founded by Arabs, is located in Unyamwezi.

Unyamwezi is the Bantu word for the country inhabited by the Wanyamwezi or Nyamwezi, a Bantu group which consists of many tribes such as the Wakimba, Wasumbwa, Wagala. They are skilled agriculturists, growing cassava, rice, maize and beans. During the first half of the 19th century Unyamwezi (visited by R. Burton and J. H. Speke in 1857) was the leading political power in Tanganyika.

Under the leadership of Mirambo, the Nyamwezi conquered

large sections of the country, defeated the Watuta-Zulu of the south (*c.* 1850), and conquered the Arab town of Tabora (1871), the centre of Africa's ivory trade. After Mirambo's death in 1886, his successor Siki failed to retain Unyamwezi's political position, since German troops occupied the country in 1890. The Nyamwezi who resisted were forced to surrender in 1893.

See the works of Burton, Speke, Stanley; G F. Sayers, *Handbook of Tanganyika Territory* (1930); H. Meyer, *Das Deutsche Kolonialreich* (1909). (H. A. WF.)

UNYORO, now officially called BUNYORO, a district in the Northern Province of the British protectorate of Uganda. The district coincides with the native state of Bunyoro-Kitara, over which a British protectorate was declared June 30, 1896. The country, extending toward the west of Lake Albert, is hilly and well-watered in the south (average altitude between 3,500 and 3,800 ft) and has a low, undulating savanna in the north. Bunyoro covers an area of 5,619 sq mi. and in 1948 had 120,926 inhabitants. Masindi, Masindi Port (on Lake Kyoga), Butiaba (on Lake Albert) and Hoima are the major settlements and trade centres; they are connected by all-weather roads.

In 1933, when the Bunyoro agreement went into effect, the native state was reorganized under British control. Although the district commissioner remained in charge of the general administration, the native ruler, whose full title is Rukirabasaija Agutamba Mukama, was associated with the administration of the state. Tito Gafabusa Winyi II, who became mukama in 1924, was assisted by the traditional council called Rukurato and by six chiefs in charge of the six *saza*s or districts into which Bunyoro is divided. The district commissioner and the mukama have their residence in Hoima.

The Banyoro, as the inhabitants of Bunyoro are called, belong to the Bantu population of Africa. The ruling Bahima families belong to the Hamitic people who invaded East Africa about A.D. 1000 and founded several states of which Buganda and Bunyoro are the most prominent. Both states were in permanent struggle for the political supremacy in the East African lake region. Although the Arabs of Zanzibar had visited Bunyoro for many centuries, the first Europeans to enter it were J. H. Speke and J. H. Grant in 1862, to be followed in 1864 by Sir Samuel and Lady Baker. Baker, having been appointed governor of Egyptian Equatoria, annexed Bunyoro to Egypt in 1872 when Kabarega was king of Bunyoro Kabarega did not recognize any foreign authority and opposed first Egyptian and later British forces. Although his country had been occupied and formally annexed by the British in 1896, he was not captured until April 1899; subsequently he was deported to the Seychelles but was permitted to return in 1923. He died upon his return to Uganda. Tito Gafabusa Winyi II, who succeeded his half-brother Andereya Duhaga II, was a son of king Kabarega.

See H. B Thomas and R. Scott, *Uganda* (1935). (H. A. WF.)

UPAS, a Javanese word meaning poison, and specially, the gum of the anchar tree (*Antiaris toxicaria*), of the fig family (Moraceae), and a native of the Sunda Islands, used to envenom the darts of the natives. According to the absurd fable (professedly by one Foersch, who was a surgeon at Samarang in 1773) published in the *London Magazine*, Dec. 1783, and by Erasmus Darwin (*Botanic Garden*, pt. ii), the tree destroys all animal life within a radius of 15 mi. The tree has a straight stem rising without a branch to 60 to 80 ft. It has a whitish bark and yields the juice from which the poison is prepared. The toxic effect is somewhat similar to that of picrotoxin. In addition, there is a digitalislike effect on the heart.

UPDIKE, DANIEL BERKELEY (1860–1941), U.S printer, was born in Providence, R I., on Feb. 24, 1860. In 1893, he began to establish the Merrymount Press. In 1895 he revived the Scotch cut type produced by Alexander Wilson about 1835. He later acquired the 17th century Dutch fonts of Janson and the matrices of the Mountjoy type, and he led in the revival of classical typography in the U.S. Special types, among them the Merrymount type, were designed by Bertram Goodhue and Herbert Horne. From 1910–17 he was lecturer on printing in Harvard university. He was selected to print the *Standard Book of Prayer* in the revision of 1928. His published works include: *On the Dedication of American Churches* (with Harold Brown; Cambridge, 1892); *Printing Types—Their History, Forms, and Use* (Cambridge, 1922), *In the Day's Work* (Cambridge, 1924). Also he edited. *A Dissertation Upon English Typographical Founders and Foundries*, by Edward Rowe Mores, with appendix by John Nichols (1924) and *Notes on the Merrymount Press* (1934). Updike died Dec 28, 1941.

UPHOLSTERY. In modern usage, an upholsterer is one who supplies coverings, cushions, padding and stuffing for chairs, sofas or beds, or who repairs them. The word first appears as "upholder," then as "upholdster" or "upholsterer," that is, a broker who holds goods up to public view The earliest example of upholstery consisted in simply stretching a piece of leather across a seat somewhat on the principle of a hammock. Subsequently, springs were added. These springs, at first shallow, developed in height and assumed the hourglass shape, permitting wide bases and a capacity to compress fully without bending over or rubbing together.

Manufacture.—Across the base of the seat webbing is stretched and tacked to the wood frame. To this the springs are sewn with cord and subsequently lashed or tied together to ensure that they do not get bent over on one side. If the chair is to have what is called a spring edge, a piece of cane is bent round at the front of the seat and also lashed to the springs, so as to form a firm edge and at the same time ensure that the springs work in unison. After this, canvas is stretched over the springs and tacked down to the wooden frame. The chair is then first stuffed with whatever material may be chosen, such as fibre or hair, a light canvas or scrim is placed over the filling and the edge stitched by hand to form a firm portion which determines the outline and form of the chair. The chair is then second stuffed with a further layer of hair or some cheaper material. This hair is then covered with a layer of wadding to prevent it from working through the cover.

The same treatment is applied to the back and arms, which may also be sprung The upholstered articles may now be first covered in calico or the final cover put on.

Perforated spring frames are sometimes employed consisting of helical springs held together by metal links and surrounded by a wire edge bent to the outline of the seat.

Sponge Rubber Cushions.—India rubber in liquid form is converted to a froth, poured into moulds, coagulated and vulcanized in boiling water or steam vapour to form the air-cell rubber cushion, 90% air by volume. Moulded cushions of this type came into general use in 1939 to replace both springs and padding material in buses and railroad cars and was introduced for domestic furniture, mattresses and passenger automobiles, both as full depth cushions and thinner pads over conventional spring frames.

The principal raw materials employed in upholstery are timber for the framework, webbing, springs, hair fibre, flock, woodwool, canvas, wadding, tacks, twine and laid cord; various coverings, such as leather, moquettes, velvets, tapestries, silks and damasks.

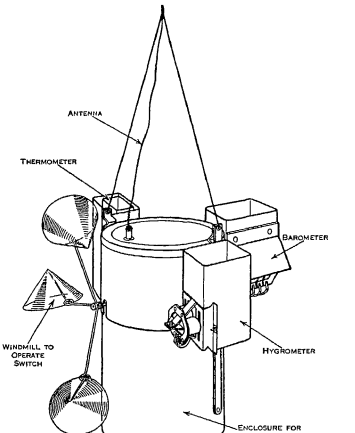
UPLAND, a town in the southern part of California, U.S., in San Bernardino county. It is situated 38 mi. E. of Los Angeles and about 20 mi. W. of San Bernardino. It is served by the Atchison, Topeka and Santa Fe, the Pacific Electric and the Southern Pacific railroads. The altitude is 1,210 ft. The population was 9,203 in 1950 and 6,316 by the federal census of 1940. Three distinct peaks mark the area just north of Upland; Old Baldy, 10,080 ft., Cucamonga, more than 9,000 ft. and Ontario, 8,750 ft. At Euclid Ave. and 12th St. in Upland, stands the "Madonna of the Trail," marking the Santa Fe trail to the coast and being one of 11 marking the line across the United States. The town has a council-manager form of government and owns its own waterworks and sewage treatment plant.

Upland is in the midst of a lemon- and orange-growing region and the ten fruit-packing plants constitute the town's principal commercial activity. The public library contains 32,000 vol.

and the general hospital, established in 1922, is operated by a non-profit association.

UPPER AIR SOUNDINGS. In meteorology the exploration of the upper air, using instruments carried by balloons, kites or aircraft, is an important part of observational technique. The term "soundings" covers the measurement of temperature and humidity, as well as other geophysical elements such as cosmic rays and the electric field, the pressure being measured at the same time in order to determine heights The term is not usually interpreted to include the measurement of upper winds, this being known as wind-finding or pilot-ballooning This article is limited to the meteorological aspect of the subject—the measurement of temperature, humidity and pressure.

The investigation of the upper air began in 1749 when Alexander Wilson attached a thermometer to a kite. With the invention of the balloon in 1783 began a century of scientific ballooning, some indication of the thermal structure of the lowest 25,000 ft. of the atmosphere being gradually obtained at great cost and serious personal risk The modern period began in 1892, when Gustave Hermite and Besançon began to use small unmanned balloons (*ballons-sondes*) carrying instruments. In 1894 Albert Rotch began the use of large kites tethered by steel wire The advent of aircraft provided a further means of carrying instruments aloft but finally resulted in the virtual abandonment of meteorological kite-flying. In the first two decades of the 20th century there was an immense development of the technique of the sounding balloon, providing a good deal of information about the lowest 60,000 ft. of the atmosphere and leading to the discovery of the stratosphere or isothermal region (*see* METEOROLOGY). The disadvantage of having to recover the instruments in order to read their records prevented a fuller exploitation of the method. In the decade 1927–36 the great advances in radio technique made possible the development of the *radiosonde*, an instrument which, attached to a free balloon, sends down radio signals that can be translated into numerical values of temperature, humidity and pressure. The results, being immediately available, can be used in forecasting; and this immense advantage resulted in the adoption of the radiosonde to the practical exclusion of earlier methods.

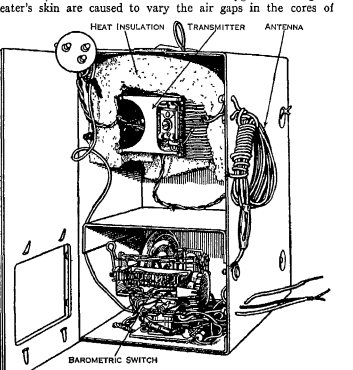


For this reason the rather complicated recording instruments (*meteorographs*) formerly used with sounding balloons will not be described here Aircraft are used to some extent for meteorological reconnaissance flights over long distances, but the very elaborate meteorographs used in the years preceding 1935 were replaced by wet- and dry-bulb thermometers, the pressure being measured by the altimeter of the aircraft. The auxiliary observations of weather phenomena made by the crew are a very important feature of reconnaissance flights.

Radiosondes fall naturally into four classes: (1) those transmitting signals spaced in time, the values of the meteorological elements being deduced from the intervals between signals; (2) those transmitting a carrier wave modulated at various audible frequencies, these being related to the values of the meteorological elements; (3) those making use of changes in carrier frequency in a similar manner; (4) those transmitting signals in Morse or other codes. Instruments of the first two classes seem to have been the most successful.

A complete radiosonde apparatus consists normally of six parts: a rubber balloon, a parachute, the meteorological assembly, the radio transmitter, the batteries and the antenna. At sea or in uninhabited regions the parachute is omitted. The meteorological assembly, the transmitter and the batteries are nearly always contained in, or attached to, one box or carton designed for the proper exposure of the meteorological instruments.

The radiosondes used by the British Meteorological office during the years 1939–46 belong to the second of the above classes, as do those used by the weather bureau and the armed services of the U S. The Canadian Meteorological division has developed an instrument of the first type.



The British and American radiosondes differ greatly in external appearance and also essentially in the means used to produce the variable audio frequency. In the former (fig. 1), an aneroid

sistances which are sensitive to temperature and to humidity and also high and low fixed resistors The two radiosondes also differ in their manner of recording, the American ground equipment recording the frequencies automatically on a chart, the British one requiring the operator to compare each received frequency with that generated by a calibrated oscillator.

The central feature of the Canadian radiosonde is a rotating disk of die-cast metal with a raised spiral on it. This disk is turned at about 4 5 r.p.m. by a special constant-speed electric motor, and in the course of each rotation the spiral makes contact with five arms, as shown in fig. 4 The pressure, temperature and humidity arms traverse the spiral, approximately radially, as the values of these elements vary. When this switching arrangement is connected to a small radio transmitter, the signal emitted consists of 5 short dashes every 13 sec., 2 of these (the reference signals) being separated by constant intervals, the 3 others varying their position in the time cycle according to the current values of pressure, temperature and relative humidity.

FIG. 4.—METEOROLOGICAL INSTRUMENTS AND ROTATING SPIRAL OF THE CANADIAN RADIOSONDE
The dashed lines show the paths of the moving arms as the pressure, temperature and humidity vary

At the ground, these signals are recorded on a special chronograph.

Other radiosondes of the time-interval type use a conducting helix on an insulating cylinder in the same way.

During World War II means of determining the direction (azimuth and angular elevation) of the radiosonde from the ground station by radio direction-finding were developed in the United States. The resulting apparatus, known as a *rawinsonde*, made it possible to determine the upper winds at the same time and was rapidly supplanting the ordinary radiosonde for military purposes by 1945. The equipment carried up by the balloon was similar to that described above, but a much higher radio frequency was employed

UPPER SIND FRONTIER, a district of British India, in the Sind province with administrative headquarters at Jacobabad (*q.v.*) Area, 2,969 sq.mi.; pop. (1941), 304,034. The land is watered by canals from the Indus, of which the chief are the Begari and Desert canals. Principal crops are millets, oilseeds, pulses, wheat and rice, most of which is sent to the sea-board; the trade from central Asia into Sind crosses the district, bringing wool and woollen goods, fruits, carpets and horses. The district is crossed by the Quetta branch of the North-Western railway, and from Jacobabad a 2½ ft. gauge line runs to Kashmor

UPPINGHAM, a market town of Rutland, England. Pop. (1931) 1,703. The Church of SS Peter and Paul has decorated portions in the nave, tower and spire. The pulpit is of the 17th century. Jeremy Taylor was rector there at the outbreak of the Civil War. The principal institution of Uppingham is the school. It is coeval with the grammar school of Oakham (1584) and had the same founder, Robert Johnson, archdeacon of Leicester During the 19th century, the school was developed by Edward Thring into a public school of great educational influence (See *Life and Letters of Edward Thring* by E. R. Parkin, published 1898.) Pop. of rural district (1938) 5,740.

UPPSALA or UPSALA, a city of Sweden, 41 mi. N. of Stockholm. Pop. (1943) 40,053. The name originally belonged to Old Uppsala, nearly 2 mi. N. of the present city This Uppsala, mentioned in the 9th century, was famous for its heathen temple, which gleamed with gold. Three huge grave mounds remain there. In the same place the first cathedral of the bishops of Uppsala was erected (*c.* 1100). But on its destruction by fire, convenience caused removal in 1273 of the archiepiscopal see to the present city, then called Östra Aros, but later Uppsala, which became a kind of ecclesiastical capital. There the kings were crowned, after their election at the Mora Stones, 10 mi. S.E. of Uppsala.

In 1567 Eric XIV murdered in the castle five most eminent men of the kingdom, three of them belonging to the family of Sture. In 1593 was held the great synod which marks the final victory of Protestantism in Sweden; in the same year the university was restored by Charles IX. In the castle, Christina, daughter of Gustavus Adolphus, resigned her crown to Charles X in 1654 In 1702 nearly the whole city burned down.

Uppsala has water communication with Stockholm by the river Fyris and the northward arm of Lake Mälar, into which it flows. The older part of the city lies on its sloping west bank.

The university, the chief and oldest in Sweden, was founded in 1477 by Archbishop Jakob Ulfsson. The main university building, completed in 1887, lies west of the cathedral The library building was erected in 1819–41. It is on the site of the Academia Carolina, founded by Charles IX, and is known in consequence as *Carolina Rediviva*. After 1707 the library had the right of receiving every work printed in Sweden. Among the mss. is the famous *Codex Argenteus* (6th century), a translation of the Gospels in the Gothic of Bishop Ulfilas (4th century). In the old botanic garden, Linnaeus had his residence. The new botanic garden was given by Gustavus III in 1787. The observatory was founded in 1730. The Victoria museum contains Egyptian antiquities. The Royal Society of Sciences, founded in 1710 by Archbishop Erik Benzelius, has a valuable library. Much of the revenue is drawn from the estates granted by Gustavus Adolphus in 1624. Every student must belong to a "nation" (*landskap*), of which there are 13, each representing a particular part of the country and having generally its own clubhouse and fund. The students have a high reputation for singing.

The cathedral stands nobly above the town; its tall western towers with their modern copper-sheathed spires are visible for many miles. It is of simple form and mainly French in style (the first architect was a Frenchman, Étienne de Bonneuil), modified by the use of brick as building material. Ornamentation is

thus slight except at the southern portal. The church was building from 1287 to 1435. It suffered from several fires, and a thorough restoration was completed in 1893. The easternmost chapel is the fine mausoleum of Gustavus Vasa. The castle was founded in 1548 by Gustavus I. It was destroyed by fire in 1702, and only part is restored Uppsala is a book-printing centre.

UR, a very important Sumerian site and the reputed early home of Abraham (Biblical Ur of the Chaldees). Ur lies about 140 miles south of Babylon, and about 6 miles south of the modern bed of the Euphrates, about two miles from the modern Ur junction on the Baghdad–Basra railway, in 31° N, 46° E. In ancient times the Euphrates ran west of Ur, reaching open water near Eridu. The river was diverted so that it passed by Ur in the time of Rimsin. The city also lay near the ancient junction of the Tigris with the Euphrates, when the former flowed along the Shatt al Hai Ur lies close to the low hills which form the edge of the Arabian desert It commanded the communications of both rivers It was close to the sea and at the same time a convenient entrepôt for the commodities of the desert. The gradual change in the coast line and in the course of the rivers has left the ruins in the desert Although most of the ruins of Ur as seen to-day,—and the *ziggurat* is one of the best preserved in Mesopotamia,—belong in their present form to the Neobabylonian period, recent excavations have shown that the site has been occupied from extreme antiquity. Original excavations were undertaken by Taylor in 1854, but a serious examination of the site was not made till after World War I by Hall. His work has since been ably continued by Woolley.

Amid the extensive remains of cemeteries, the most recently found graves, which lie south-east of the sacred enclosure, are the most interesting The graves fall into three periods, and are dated provisionally by Woolley at 3500 B.C., the second series are comparable with Cemetery A at Kish, and are dated by Woolley at about three centuries later, while the third series are some centuries later, but at present are undated.

The richest graves of all belong to the earliest period Their wealth of precious metal shows that there was a very considerable and prosperous civilization, while the settled style of the art shows that this civilization was already an old one. The graves antedate the first dynasty of Ur by 400 years, they come therefore in the period subsequent to "the flood," a period in which Sumerian historians placed two dynasties, those of Kish and Erech. For these periods and for the first dynasty of Ur they record only the names of the kings, often exaggerating the length of their reigns to an absurdly great degree. The excavations at Ur have, however, produced inscriptions of the first dynasty and these early graves show that the occupation of the lower river valley is extremely ancient, while additional confirmatory evidence of an early date has recently been found at Kish.

The great temple area at Ur is both striking and has had many archaeological results. The temenos or sacred enclosure as it exists to-day is the work of Nebuchadrezzar. The outer wall appears to have been pierced by six great gateways. On the north-east side the more northerly had a corner stone with an inscription of Bur-Sin. The southerly was restored by Cyrus, the son of Cambyses. On the south-western side the gateway opposite the ziggurat had an inscription of Nabonidus.

The ziggurat stands in the north-west corner of the sacred area. It consists of three stories. The lowest, which measures 210 × 140 × 20 feet, was built by Ur-Nammu and Dungi and was built so well that further restoration was apparently never needed. The second stage was restored by Nabonidus. A small building crowned the third stage. This was the bedchamber of the god and goddess, not a temple as Herodotus supposed The face of the first stage was blackened, the second and third was of red stone, while the shrine on the top was encased in blue brick, the work of Nabonidus. On the north-east side there were three stairways, leading from the platform to the second stage, two ran along the face of the tower from the north and east angles respectively and met in the middle, from which point there was a third stairway, running towards the face of the tower, at right angles to the other two.

East of the ziggurat lay the great temple of E-num-mah. The ruin is of three periods, prehistoric to Neobabylonian, and of the time of Cyrus. The old Sumerian foundation wall was made of unbaked brick built on a foundation of clay which had been beaten hard On this there were two courses of unbaked bricks of Bur-Sin, 8 ft. 9 in. thick and 8 ft. 5 in high, which had been restored at various times. On either side there are a row of rooms The temple was laid in ruins between the time of Hammurabi and the Kassite dynasty. Nebuchadrezzar II made a complete restoration. The old temple had no great open court, an obvious need in a great temple; for this Nebuchadrezzar made provision

South-east of the ziggurat was a much ruined temple of Ningal. The middle cella and the side chapels lie on the north-west side of the court, and the entrance, through a great recessed doorway is on this side On either side there were two rooms connecting with antechamber and chapels and the plan recalls the temple of Ishtar at Babylon. A roadway led from the south-east of the temple of Ningal, ending in a great double gateway which gave access to the court of a great rectangular building east of the temple. There was communication from the south corner of the temple court to this street through a pair of recessed gates. At the other end of the roadway the excavators found a recess with a door opening on to a building of the Kassite period.

Between the temple of Ningal and E-num-mah lay the shrine of Nannar, E-dub-lal-mah. This is mentioned in an old liturgy as a temple of Ur and buildings of this name occur in other cities, such as Adab, Larsa, Lagash and Isin The town itself was excavated by Woolley. It has been shown that the old town of Ur, as it presented itself to Abraham's view, cannot have differed much from the modern mudbrick towns of Mesopotamia.

See, for earlier excavations, *Cambridge Ancient History*, vol. I, 1923 (bibliography); H R. Hall, *Museum Journal*, XV. Woolley's reports are appearing annually in the *Antiquaries Journal* (Vol. III. onwards). *See* also C Leonard Woolley, *Ur of the Chaldees* (1930); S. Langdon, *Der alte Orient*. 26 (1928). (L. H. D. B.)

URAL-ALTAIC LANGUAGES. The Ural-Altaic languages consist of two groups. The first is the Uralian group (Finno-Ugrian languages [*q.v.*], and the Samoyedic languages), spoken round the Ural mountains; and the second, the Altaic (Turkish [*q.v.*], Mongolian [*q.v.*], and Tungus tongues) in derivation from the mountain ranges of that name.

The Phonetic System.—Almost without exception the Ural-Altaic languages recognize a law of vocalic harmony. Exceptions exist but are explained consistently with the general principle: that in any single word only vowels of the same "timbre" may appear; thus, if the radical vowel of a word be *o* or *u*, the vowels in the other syllables must be *o*, *u* or *a*. In other words, vowels in the same word must harmonize in method of articulation. On the other hand, if the root-vowel is *e* or *i*, the vowels of other syllables of the same word must be pre-palatals or anterior-vowels (*i.e.*, articulated in the forepart of the mouth like *e* and *i*).

We have thus in Finnish the word *kesi* "hand," *kivi*, "stone," *metsä*, "forest," opposed to *kala*, "fish," *sulka*, "feathers," etc. The same applies to Hungarian, *repul*, "to fly," *lélek*, "soul," *segit*, "to help," presenting vocalic contrast to *három*, "three," *olvad*, "to smelt," *savanyu*, "bitter," etc. Turkish is even more observant of detail: *deri*, "skin," *dudak*, "lip," *bajak*, "leg, thigh," *böjük*, "big, tall," etc. (These examples are from Osmanli.)

In actual practice, there are numerous exceptions. Nevertheless, in Mongolian, Turkish, Hungarian and Finnish, vocalic harmony, without being general, tends to establish a balance between the divisions and dispositions of words, and is thus an important factor in the phonetic structure of Ural-Altaic languages

Consonantal Alternation.—In any given word the consonant which ends the root syllable is subject to various mutations according to the nature of the syllable following (open or closed) It is especially characteristic of certain Uralian tongues, like Lapp, Finnish and the Samoyedic languages. In the other languages it has not developed beyond the merest trace. Thus, in Finnish, *hukka*, "flower," but *kukan* (genitive), "of the flower"; *kuto-*, "to weave," but *kudon*, "I weave"; *repo*, "fox," but *revon* (gen.) "of a fox"; *onki*, "fish-hook," but *ongen* (gen.) "of a fish-hook"; *lintu*, "bird," but *linnun* (<*lindun*), "of the bird," etc. In their present form

the consonantal alternations, so numerous and so varied in Finnish and, above all, in Lapp, give no indication of what they once were. In early times, it seems probable that at the end of the root syllable, there was an alternation of degree—a strong one and a weak one, *tt. kk. pp.* and *t k p.* There was also an alternation which produced a contrast between *p. t. k.* and *β. δ. γ*; *m. n* ɔ, and *β. δ. γ.*, etc This alternation extended to groups of consonants opposing a strong *nt* to a weak *nd*, *mp* to *mb*, *ks* to *γz*.

This alternation theory (German *Stufenwechsel*) was formulated by the Finnish linguist, E N. Setalä, who proposed to extend it to Altaic tongues, where Ramstedt had discovered it in part. It is unlikely that consonantal alternation can be demonstrated in Mongolian, Turkish and Tungus except at a very early stage.

Vocalic Alternation.—There exists also an alternation of vowels by which, according to the suffixes which a word may take, the vowel of the root syllable may be modified or changed. Thus, in Finnish, *pala*, to burn (intrans.), and *polttā*, "to burn" (trans.); in Ostyak, *w'ālsm*, "tongue," and *n'ilmom*, "my tongue," etc. These instances are rare in modern Ural-Altaic speech, and the Uralian tongues have best preserved the traces, although examples are also found in Turkish and Mongolian.

The rules which determine the beginning and ending of words are that no word can begin with more than one consonant, and when a foreign word so beginning is borrowed it is simplified accordingly. The Swedish word *stor*, "big," becomes *suuri* in Finnish Elsewhere a vowel is put before the double consonant to facilitate enunciation: the Slav word *stolu* is in Hungarian *asztal* (pron. *ostol*) and the English "steam" is, in Osmanli, *istim*, etc.

The accent varies in position and quality. Finnish and Hungarian stress regularly the first syllable and Turkish the last. In Samoyedic and other idioms such as Ostyak it varies.

Morphology.—In the first place, no language of the group uses prefixes, all the grammatical modifications expressed in English by prepositions (viz, to, on, of, for, etc.) are effected by means of suffixes. "I enter the house," is, in Hungarian, *belépek a ház-ba* (*ház*, "house"—*ba*, suffix meaning "into"). In a tale written in Kazan Turkish we find: *ber keše urmanγa barγan dej*, "a man went into the forest" (*urman*, "forest"—*γa*, "into"). The majority of the grammatical relations affecting words are therefore expressed by suffixes, which differ in form from language to language, but play the same rôle throughout. These suffixes are strengthened by post-positions: thus (Hungarian), *egy fa alatt*, "under a tree" (*egy*, "one, a," *fa*, "tree," *alatt*, "below").

The possessive case is formed by suffixes except in Mongolian and Tungus. Hungarian *szem-e-m*, "my eye" (*szem*, "eye" + *m*, "my," with euphonic *e*) *szemed*, "thine eye" (*-d*, "thy, thine"); *szeme*, "his eye" (*-e*, "his"); *szeminnk*, "our eye" (*-ünk*, "our"), etc. Osmanli Turkish also has this form, *ev-im*, "my house" (*ev* "house," *im*, "my"); *ev-in*, "thy house" (*-in*, "thy"); *ev-i*, "his house" (*i*, "his"); *evimiz*, "our house" (*-imiz*, "our"), etc. This use of the possessive prefix is, however, comparatively modern, since it does not exist in Mongolian and Tungus and, further, since in Hungarian as in Turkish these suffixes are added directly to the root before other suffixes, while in other tongues (Finnish, Lapp, etc.) they follow all other suffixes. Compare Hungarian *a házamban*, "in my house" and Turkish (Osmanli), *evimde* (idem) with Finnish *kodassa-ni* (*-ni*="my").

The Uralian languages, Turkish, Mongolian and Tungus appear to have developed their system of word-building as we know it to-day at a date which, if not recent, was well after the time when the languages were closely related. Only a few suffixes can be restored throughout the family; it may be suggested tentatively that one method of forming the plural was to suffix a *-t* to substantives, as in modern Mongolian, Tungus and Uralian, a process of which Turkish has conserved a few traces The main characteristic of the Ural-Altaic tongues is the difficulty, even in modern speech, of distinguishing between nouns and verbs by their outward forms. The conjugation of the verb is reminiscent of the possessive-suffix system of the noun and many verbal suffixes are identical in form with those which are used to construct new nouns. The adjective has no proper declension.

Vocabulary.—All words dealing with rudimentary civilization are common to all the languages, such as those expressing relationship (father, mother, uncle, aunt, etc), certain elements, animals and plants, primitive occupations and simple movement and gesture words. The comparative philology of these languages demonstrates a neolithic civilization of the type of which traces have been found in different parts of the Urals This primitive vocabulary, the common patrimony of all the tongues, is augmented by words of very diverse origin. Mongolian and Turkish have borrowed much from Chinese and Indian languages Uralian languages have drawn largely on Indo-European stocks and in modern days times many Iranian terms have been admitted In modern days Hungarian, Wogul, Ostyak, Cheremiss and Wotjak have taken many words from Turkish lexicography. Tungus has a large percentage of Mongolian words; Osmanli Turkish has adopted much from Arabic and Persian. Mongolian and Turkish have lent to, and borrowed from, each other, and Palaeo-Asiatic elements have enriched and varied the vocabularies of the Ural-altaic languages spoken in Asia. In Europe, Finnish, Lapp and Estonian have borrowed much from Germanic, Baltic and Slav languages, Hungarian from Ossetian, Slav tongues and German. The vocabularies of the Finno-Ugrian and Turkish languages spoken on Russian territory are rapidly becoming Russianized.

Numerals.—The Ural-Altaic numeral system is decimal throughout. The names of the numbers in the different languages differ widely, because the primitive Ural-Altaic speech had not developed a proper numerical system before the dispersion.

CLASSIFICATION OF URAL-ALTAIC LANGUAGES

A. URALIAN LANGUAGES

Finno-Ugrian Languages (*q.v*)—1. Lapp: Southern Lapp, Ume-Lapp, Swedish-Lapp, Norwegian-Lapp, Enare-Lapp and Kola-Lapp. 2. Finnish: *Suomi* (of Finland), Karelian, Olonetsian, Ingrian, Ludik, Vepse, Wote, Estonian, Livian. 3. Mordvinian, Moksha, Erza. 4. Cheremiss. 5. Permian: Wotjak, Syryene. 6 Ugrian: Wogul, Ostyak, Hungarian (Magyar).

Samoyedic Languages.—Yurak, Tawgy, Yenisseian, Kamass (or Sayan Samoyedic), and Ostyak-Samoyedic.

B. ALTAIC LANGUAGES

Turkish Languages.—1. Turkish of Altai, Uzbeg, Kirghiz, Bashkir. Tatar: Azeri, Turkmen, Osmanli, etc. 2. Yakut. 3. Chuvash.

Mongolian Languages.—1. Eastern Mongol (Khalkha, Tsakhar, etc.). 2. Western Mongol (Kalmuck). 3. Northern Mongol (Buriat).

Tungus Languages.—1. Eastern Tungus: Goldic, Olcha, Lamut, Orochene, etc. 2. Southern Tungus: Dahur, Solonic, etc. 3 Western Tungus (Tungus of Vershoïansk, Yakutsk and of the Yenissei, etc), Manchu.

Many sub-dialects are necessarily annulled, and this brief classification does not imply, so far as Altaic languages are concerned, any definite relationship. The relationships of these different tongues are, as yet, far from being elucidated.

BIBLIOGRAPHY.—There are numerous publications on the Ural-Altaic languages. Apart from special works of interest only to scholars, may be mentioned: A. Sauvageot, "Langues Finno-Quériennes et Samoyèdes" in *Les Langues du Monde* (1924); J Deny (*ibid*) "Langues turk, mongoles, tongous"; Szinnyei, *Finnisch-ugrische Sprachwissenschaft*; J. Németh, *Türkische Grammatik*; P W Schmidt, *Die Sprachstämme des Erdkreises*, E N Setälä (Tetosanakirja X., p. 244 Helsingfors). (*See* bibliographies under TURKISH, HUNGARIAN, FINNISH, MONGOLIAN LANGUAGE AND LITERATURE.) (A SAU)

URAL MOUNTAINS, a mountain system which extends north to south, from the Arctic ocean to the Caspian sea and separates Europe from Asia. The Urals have been affected by a series of separate upheavals, some having a north to west strike and some a north to east. They reach their maximum altitudes along a zone stretching nearly north and south. The composite nature of the Urals is best seen at the extremities of the system, where the upheavals form a distinct chain of mountains.

The Paĕ-khoy or coast ridge (Samoyedic "stony ridge") is independent of the Urals proper It has a distinct north-north-west and north-west trend, and although cut through by the Yugor strait it is continued in Vaigach island and Novaya-Zemlya. Its

dome-shaped summits rise 1,000 ft.

The Obdorsk or Northern Urals begin near the head of Kara bay and extend southwest to the 64th parallel and form a distinct range, stony and craggy, sloping steeply towards the southeast and gently towards the marshes of European Russia Its highest peaks are Khard-yues, 3,715 ft., and Pae-yer, 4,752 ft. Sometimes the main chain has on the west two or three secondary chains, formed by sedimentary rocks, and the highest peaks of the Urals (Sablya, 5,402 ft., and Toll-poz-iz or Murai-chakhl, 5,537 ft.) occur in the south of one of these. Dense forests, chiefly fir, pine and larch, clothe the mountain slopes, but every species, except the larch, gradually disappears in the north, and the upper limit of vegetation (2,400 ft. in the south) rapidly descends to the base of the mountains near the Arctic Circle, and forest vegetation disappears about 65° N. (67° in the plains).

The section between 64° and 61° N. has again a wholly distinct character. Here the main water-parting is a succession of plateaus stretching in a northwesterly direction It has broad, flat, marshy valleys, while here and there are isolated summits, mostly under 3,000 ft. (Yang-tump, 62° 43′ N., 4,170 ft) The whole region, except the mountain summits, is densely clothed with coniferous forests. This part of the range is uninhabited.

The Middle Urals, about 80 mi. broad, contain rich iron, copper and gold mines (Bogoslovsk, Goroblagodatsk and Ekaterinburg Urals) The Denezhkin Kamen in the north (4,841 ft.) and the Tara-tash in the south (2,800 ft) mark the limits of this section. Here the orographical structure is more complicated. In the north (61st to 60th parallel) there is a succession of chains with a distinct northeastern trend. South of Kachkanar (2,866 ft) the Urals assume the appearance of broad swellings 1,000 to 2,000 ft. in height, deeply trenched by ravines. These low plateaus have been utilized for centuries as the chief highway to Siberia. The water-parting between the Russian and Siberian rivers is here not more than 1,245 ft. above sea level on the great eastward road, west of Sverdlovsk (Ekaterinburg). The valleys have a decidedly southeastern direction, as has the railway from Perm to Kurgan. The Middle Urals are densely forested. The valleys and lower slopes have a rich soil and contain large and wealthy villages The mines also support a considerable population.

The Southern Urals (55° 20′ to 51° N.) consist of three parallel chains running northeast and southwest and constitute an independent part of the Ural system. The Urals proper are a low sinuous chain hardly exceeding 2,200 to 2,800 ft. in altitude. Farther west there is a parallel chain which, although pierced by rivers, reaches 5,230 ft ; while farther west still is another series of equally high chains. The gentle slopes of the hilly tracts are dotted with woods, mostly of deciduous trees, while the hollows contain rich pasture grounds. The region is being colonized.

Farther south the main range, except when deeply trenched by the rivers, is a plateau which hardly reaches 1,500 feet. It is continued towards the Volga under the name of Obshchiy Syrt.

South of the great bend of the Ural river, quite independent ranges of hills, or flat swellings, appear (*e g.*, Dzhaman-tau, Mugodzhar hills). A range of heights connects the Mugodzhar hills with the Ust-Urt plateau.

In the distribution of the races of mankind the Urals have played an important part. The Northern Urals are inhabited by Finnish races (Samoyedes, Syryenians, Voguls and Permians) who have been driven from their former homes by Slav colonization, while the steppes on the slopes of the Southern Urals have continued to be inhabited by the Turkish Bashkirs. The Middle Urals were in the 9th century the abode of the Ugrians, and their land, Bjarmeland, or Biarmia (later Perm), was well known to the Byzantine historians for its mineral wealth—there being at that time a lively intercourse between the Ugrians and the Greeks. Compelled to abandon these regions, they moved (in the 9th century) south along the Ural slopes towards the land of the Khazars, and through the prairies of southeastern and southern Russia [the *Λεβεδία*] of Constantine Porphyrogenitus) towards the Danube and to their later seat—Hungary—leaving but very few memorials behind them in the Northern and Middle Urals

Geology.—The Ural mountains are no more than the western edge of a broad belt of folding of which the greater part is buried beneath the Tertiary deposits of western Siberia. Throughout the greater portion of the chain a broad strip of granites, diorites, peridotites, gneisses and other crystalline rocks rises directly from the Siberian plain, and is covered towards the west by Silurian, Devonian, Carboniferous, Permian and Triassic strata, which are thrown into numerous folds parallel to the length of the chain and usually rise to much greater heights than the crystalline zone.

URALSK, a town in West Kazakhstan in the Kazakh S.S.R., on the Ural river, where the railway crosses it. Pop. (1939) 66,201. Founded in 1775, it is a centre for grain and cattle from the Kirghiz steppe. There are seven flour mills and four leather and gut preparing works with iron and woollen industries; also a model farm, a museum, and branches of the Russian Geographical and of the Fisheries societies.

It has two cathedrals: one founded in the 18th century, the other in 1837.

URANIUM. The metallic element uranium has the symbol U, atomic number 92 and chemical atomic weight 238 07. It occupies a position in the periodic system of the elements as the third member of a transition series, the actinide series, which includes the heaviest known elements, and in which an inner electronic shell (the 5*f* shell) is being filled The electronic structure of the gaseous atom has been determined to be that of the element radon plus three 5*f*, one 6*d* and two 7*s* electrons. The following table lists the known isotopes, natural and artificial:

Isotope	Half Life	Type of Radiation and Energy (Mev)	Source
U^{240}	20.8 days	α (5.86)	Artificial
			Pa^{240} β^- decay
U^{238}	70 yr.	α	Artificial
			Pa^{233} β^- decay
U^{233}	1.62×10^5 yr.	α (4.80)	Artificial
			Pa^{233} β^- decay
$U^{234}(U_{II})$	2.35×10^5 yr.	α (4.76)	Natural
			Pa^{234} β^- decay
U^{235}(AcU)	7.07×10^8 yr.	α (4.52)	Natural
U^{227}	6.8 days	β^- (0.26)	Artificial
			U-n-2n
$U^{238}(U_I)$	4.51×10^9 yr.	α (4.21)	Natural
U^{239}	23 min.	β^- (1.2)	Artificial
			U-n-γ

Naturally occurring uranium consists of the three isotopes of mass numbers 238, 235 and 234 with relative abundances 99 28%, 0.71% and 0.006%, respectively The isotope U^{238} is the parent of the natural uranium ($4n+2$) radioactive series; the isotope U^{234} is also a member of this series, and thus these two are linked by radioactive decay. The isotope U^{235} is of other origin, is the parent of the actinium ($4n+3$) radioactive series, and has a great importance because it undergoes nuclear fission with slow neutrons. It is prepared at Oak Ridge, Tenn., in nearly pure isotopic composition in substantial amounts. The synthetic transuranium element plutonium, which is also fissile with slow neutrons, is prepared by the absorption of neutrons by the isotope U^{238}.

History.—The element uranium was discovered in 1789 by Martin Heinrich Klaproth in the course of an examination of pitchblende mineral originating in Saxony. To this new substance he gave the name uranium in honour of Sir William Herschel's discovery of the planet Uranus in 1781. Klaproth and two gegerations of chemists who followed him were under the impression that uranium metal itself had been prepared. In 1841, however, Eugène Melchior Péligot demonstrated that Klaproth's substance was actually the oxide UO_2; Peligot then succeeded in preparing the metal by the reduction of uranium tetrachloride with potassium. Péligot may thus be properly considered the founder of uranium chemistry.

The formulation of the periodic system by Dmitri Ivanovich Mendeleyev in 1869 directed attention to uranium as the heaviest of the elements, a position which was confirmed and held until the discovery of the first transuranium element in 1940 In 1896 Henri Becquerel discovered in uranium the phenomenon of radioactivity, a property that was later found in many other elements

(*see* RADIOACTIVITY, NATURAL). This significant discovery stimulated a new and lasting interest in the previously rather obscure element Becquerel exposed a photographic plate wrapped in black paper to the action of the beautiful fluorescent salt, potassium uranyl sulphate, $K_2SO_4 \cdot UO_2SO_4 \cdot 2H_2O$, and observed that a distinct impression had been produced on the plate Further experiments indicated that metallic uranium, all uranium salts and uranium minerals (especially pitchblende) give rise to the same phenomenon These epoch-making observations were closely followed by the discovery of radium in pitchblende (*see* RADIUM)

Occurrence.—Although uranium is usually regarded as one of the rarer elements, it is actually present in the earth's crust to a considerably greater extent than such "common" elements as cadmium, bismuth, mercury, silver or iodine. The bulk of the uranium seems to be present in the upper 12–13 mi of the lithosphere, in an amount estimated to be roughly 10^{14} tons, an average content of approximately 4×10^{-6} g. per gram of rock Concentration varies in normal rocks between about 0.2×10^{-6} and 25×10^{-6} g. per gram of rock, with higher values present in acid (high silica content) rocks such as granite Relatively minor amounts are found in the "basic" basalt rocks such as form the floors of the ocean. It is also found in very small quantities in meteorites.

Uranium is present in sea water to the extent of about $\frac{1}{2,000}$ as much as is present in an equal weight of average rock Living matter contains uranium in amounts varying from 10^{-4} to 10^{-9}% by weight, but the biological significance of the element is obscure The fixing of uranium by algae may have played a role in the formation of certain uranium deposits. There is no simple relationship between the mean concentration of an element in the earth's crust and the probability of finding economically important deposits of that element. In the case of uranium, despite the existence of widely distributed uranium minerals, only two, pitchblende and carnotite, exist in substantial deposits, and these are very few. Pitchblende is a dark bluish-black massive mineral possessing a pitchlike lustre, from which fact its name is derived, and it consists of an impure oxide of the formula U_3O_8 Carnotite is essentially a complex vanadate of potassium and uranium of the approximate composition $K_2O \cdot 2UO_3 \cdot V_2O_5 \cdot 3H_2O$

The most important sources of uranium in 1948 were the pitchblende deposits of the Belgian Congo and the Great Bear lake area, Northwest Territories, Canada. It is entirely possible that large deposits exist elsewhere as well. The pitchblende deposits of Czechoslovakia are of much smaller extent, and even smaller deposits are to be found elsewhere, as in England, East Africa, Australia, the United States and continental Europe. There are carnotite deposits in the United States in southwest Colorado and southeast Utah and also in other places such as Australia and continental Europe.

The extraction of uranium from ores is usually rather complicated since most uranium ores contain a great variety of accompanying metallic elements. The ore is ground and leached with acid, and the uranium can be separated by precipitation reactions. The uranium often leaves the refinery as the oxide, U_3O_8, which may be dissolved in nitric acid to yield solutions of uranyl nitrate The uranyl nitrate can be further purified by extraction into diethyl ether.

Uranium and its chain of decay products correspond to a source of radioactive energy which has some importance and has been much studied with respect to the problem of the internal heating of the earth. Its long half life makes possible determinations of the age of the earth by measuring the amount of lead, uranium's ultimate decay product, in certain uranium-containing rocks

Uses.—Uranium had very limited uses before its use for nuclear energy. It has been suggested for filaments of lamps. A small tube of UO_2, connected in series with the tungsten filaments of large incandescent lamps used for photography and motion pictures, tends to eliminate the sudden surge of current through the bulbs when the light is turned on, and thereby extends their life. Its compounds have been used in photography for toning and as a dye or stain in the leather and wood industries. Uranium salts are mordants for silk or wool. A little ferrouranium has been utilized in making special steels, but its value in this connection is questionable, since such alloys may be pyrophoric if they contain 20% or more of uranium Sodium and ammonium diuranates have been used in ceramics to produce coloured glazes Only 0.006% is needed to give good yellow colours By increasing the percentage, the colour may be changed to orange, brown, green or black Uranium carbide has been suggested as a good catalyst in making synthetic ammonia. Small quantities of uranium salts are claimed to stimulate plant growth, but large quantities are poisonous to plants

By far the most important use of uranium lies in its application for nuclear (or atomic) energy This use, in fact, so increased the value of uranium as to eliminate its use for many of the purposes mentioned above The element with its natural isotopic composition can be used in large chain-reacting "piles," where the reaction is sustained by the rare isotope U^{235}, and the synthetic element plutonium (the isotope Pu^{239}) is manufactured at the same time by transmutation of the U^{238}. The first self-sustaining nuclear chain reaction was produced at the wartime Metallurgical laboratory of the University of Chicago on Dec. 2, 1942 The reactions may be written.

(1) ${}_{92}U^{235}$ + neutron $\rightarrow$ fission products + energy + neutrons

(2) ${}_{92}U^{238}$ + neutron $\rightarrow {}_{92}U^{239} \xrightarrow{\beta^-} {}_{93}Np^{239} \xrightarrow{\beta^-} {}_{94}Pu^{239}$

Smaller nuclear "reactors" may be built to use the pure or nearly pure isotopes U^{235} or Pu^{239} as fuels The abundant isotope U^{238} can thus be indirectly "burned," at least in part, as nuclear fuel through the transformation to Pu^{239}, leading to a more efficient use of the uranium A fissionable isotope such as U^{235} or Pu^{239} gives rise to an amount of "heat energy equivalent" of about 10,000,000 kw hr per pound, when it completely undergoes the fission reaction.

The isotopes U^{235} and Pu^{239} can be used as the explosive ingredients for nuclear (atomic) weapons (*see* ATOMIC ENERGY). This possibility led in a number of countries to a certain amount of control over the mining and processing of uranium.

PHYSICAL PROPERTIES

Uranium is a lustrous white metal resembling steel in appearance It melts at 1,130° C, boils perhaps at 3,500° C, and has a density, calculated from X-ray data, of 18.97 g per c c. The metal is ductile, malleable, capable of taking a high polish and not hard enough to scratch glass. It undergoes two transitions, at 665° C and 892° C., respectively, and, according to some authorities, is "pseudometallic" in character. The crystal lattice at room temperature is orthorhombic (unit axes of crystal all at right angles to each other and all of unequal length) and can best be interpreted as having distorted hexagonal closest packing; its structure is thus quite different from that of chromium, molybdenum and tungsten metals. It has not been possible to assign an unambiguous radius to uranium in the metallic state. The abnormalities of the uranium structure are reflected in various properties such as an abnormally high electrical resistivity ($32\text{-}76 \times 10^{-6}$ ohm-cm) of the metal at room temperature.

Metallic uranium is a highly reactive substance It decomposes water, and in the form of powder may spontaneously inflame in air. It combines directly with oxygen at 170° C, with chlorine at 180° C., with bromine at 210° C and with iodine at 260° C. The metal reacts with gaseous hydrogen at 250° C to form a hydride of the formula UH_3. It reacts with nitrogen, carbon monoxide, carbon dioxide and many other gases, uranium can therefore be used in the laboratory for gas purifications Metallic uranium reacts with acids with the liberation of hydrogen and the formation of compounds of U^{III} and U^{IV}; caustic alkalis are without action upon it. Uranium metal appears to stand between aluminum and manganese in the electromotive series; it displaces tin and metals below it from solutions of their salts The oxidation-reduction potential for $U \rightarrow U^{IV}$ appears to be about 1.40 volts (on the scale in which the potential for $\frac{1}{2} H_2 \rightarrow H^+$ is taken as zero).

CHEMICAL PROPERTIES

Oxidation States of Uranium.—Uranium has the four oxidation states +3, +4, +5 and +6, and the ions in aqueous solution are usually represented by U^{+3}, U^{+4}, UO_2^{+} and UO_2^{++} The oxidation-reduction scheme is indicated below

$$U^{+3} \underset{0.63 \pm 0.02\text{ v.}}{\text{———}} U^{+4} \underset{(-0.662\text{ v.})}{\text{———}} UO_2^{+} \underset{-0.066 \pm 0.002\text{ v}}{\text{———}} UO_2^{++} \quad (U^{+4} \text{ to } UO_2^{++}: -0.334\text{ v.})$$

Oxidation-Reduction Potential of Uranium Ions
(In 1 Molar Hydrochloric Acid)

The UO_2^{++} ion is unstable in solution and undergoes disproportionation to U^{+4} and UO_3^{++}. A few solid compounds of this oxidation state U^{V} are known, as for example, UF_5 and UCl_5.

The ion U^{III} forms intense red solutions in water and is oxidized by water at an appreciable rate The rate of oxidation appears to increase with increasing ionic strength, although strong solutions are claimed to be stabilized by strong acids such as hydrochloric. Solutions of U^{IV} are green, and U^{VI} solutions, yellow. Considerable data on the absorption spectra of the various ionic states have been obtained, and these are useful for analytical purposes.

U^{VI} and U^{IV} are the important oxidation states, and therefore the important chemistry of uranium may be related to the two oxides UO_3 and UO_2, uranium dioxide and uranum trioxide A series of salts such as UCl_4 and $U(SO_4)_2 \cdot 8H_2O$ is obtained from UO_2. The more common uranyl salts, $UO_2(NO_3)_2$ etc. UO_2Cl_2 and $UO_2SO_4 \cdot nH_2O$, in which the UO_2^{++} (uranyl ion) acts as a radical, are derived from UO_3.

The element also exhibits a formal oxidation number of U^{II} in a few solid, sesmmetallic in nature, compounds such as UO and US. No simple ions of oxidation state U^{II} are known in solution.

Uranium Oxides.—In addition to the three oxides, UO_2 (brown), U_3O_8 (greenish-black) and UO_3 (yellow), which have been known for a long time, there are known to exist the monoxide, UO, and the oxide U_5O_8. There is also some evidence for the existence of U_4O_9 and U_6O_{17}. The phase relationships in the uranium-oxygen system are very complex because solid solutions are readily formed, so that it is possible to obtain uranium "oxides" with practically any composition intermediate between UO and UO_3.

Uranium trioxide exists in a number of crystal modifications It is usually prepared by thermal decomposition of uranyl nitrate at about 300° C The oxide U_3O_8 is formed when any uranium oxide is ignited in air at about 700° C Uranium dioxide is usually obtained by hydrogen reduction of UO_3 at elevated temperatures (500° C). All of these oxides dissolve readily in nitric acid to give uranyl solutions. Uranum trioxide decomposes to U_3O_8 upon ignition at 500°–700° C., UO_2 is refractory, melting above 2,000° C.

Closely related to the oxides are the uranates and diuranates. Sodium duranate, $Na_2U_2O_7 \cdot 6H_2O$ is the uranium yellow of commerce. The simple uranates have the typical formula Na_2UO_4; this type of compound is much more difficult to prepare than the diuranates which are obtained by addition of alkali to uranyl solution. These compounds correspond to chromates and dichromates, but, of course, lack the strong oxidizing properties of the latter

Uranium peroxide, the formula of which is usually given as $UO_4 \cdot 2H_2O$, is formed by precipitation from solutions of uranyl nitrate by hydrogen peroxide Alkali hydroxide, hydrogen peroxide, and sodium peroxide form soluble peroxyuranates, $Na_4UO_8 \cdot 4H_2O$ and $Na_4UO_8 \cdot 8H_2O$, when added to solutions of uranyl salts.

Uranium Nitrides and Carbides.—Two uranium carbides are known, the monocarbide UC and the dicarbide UC_2. These can be prepared by direct reaction of carbon with molten uranium, or by reaction of carbon monoxide with metallic uranium at elevated temperatures The latter reaction yields a mixture of UC and UO_2. The sesquicarbide U_2C_3, although reported in the older literature, does not exist at room temperature; it is actually an equimolar mixture of UC and UC_2. However, U_2C_3 may exist as such above 2,000° C.

Uranium and nitrogen form an extensive series of compounds that can be prepared by direct action of nitrogen on the metal. Uranium mononitride, UN, is the lowest nitride of uranium. If the mononitride is treated with more nitrogen at atmospheric pressure, UN_2 is formed. With nitrogen under high pressure UN_2 can be prepared, but it is difficult to obtain samples of UN_2 that are completely free of UN.

The carbides and nitrides of uranium are relatively inert semimetallic compounds. Uranium mononitride is stable in the absence of air to temperatures above 2,000° C ; the monocarbide is likewise refractory. Both carbides and nitrides are converted to U_3O_8 by ignition in air. They are soluble with difficulty in acids.

Uranium Hydride.—As mentioned above, uranium metal reacts with hydrogen at 250°–300° C. *to form a well-defined hydride*, which resembles the rare-earth hydrides in many respects. The formula of this substance has been shown to be UH_3. The hydride undergoes decomposition with increasing temperature; the dissociation pressure of UH_3 is one atmosphere at 436° C

Uranium hydride is of considerable importance in the syntheses of other uranium compounds. Since the formation of uranium hydride from massive uranium metal is accompanied by a complete disintegration of the metal to a microcrystalline powder, and since the hydrogen can then be driven off by heating *in vacuo* to 350°–400° C , very finely divided reactive uranium metal can be prepared. Further, the hydride itself is very reactive and can be used conveniently to prepare halides, carbides, nitrides, etc , of uranium at relatively moderate temperatures with the appropriate reagent.

Uranium Halides.—The halides of uranium constitute a numerous and important set of compounds. The following table lists the known uranium halides:

*Halides of Uranium**

Fluorides	Melting Point °C.	Chlorides	Melting Point °C	Bromides	Melting Point °C	Iodides	Melting Point °C
UF_3	(1,430)	UCl_3	835	UBr_3	752	UI_3	(757)
UF_4	1,036	UCl_4	590	UBr_4	499	UI_4	506
U_2F_9	↑	UCl_5	(327)				
U_4F_{17}	↑	UCl_6	179				
UF_5	(327)						
UF_6	64‡						

*Parentheses indicate estimated values
†Undergoes disproportionation to UF_5 and UF_6 on heating
‡Under pressure, UF_6 sublimes below its melting point

Uranium tetrafluoride serves as a starting material for the preparation of the other fluorides It is best prepared by hydrofluorination of uranium dioxide:

$$UO_2 + 4HF \xrightarrow{500^\circ\text{ C.}} UF_4 + 2H_2O.$$

Uranium trifluoride can be prepared by reduction of UF_4 with hydrogen at 1,000° C. Uranium hexafluoride, UF_6, is best obtained by direct fluorination of UF_4, although any uranium compound will yield UF_6 by reaction with fluorine at elevated temperatures

$$UF_4 + F_2 \xrightarrow{350^\circ\text{ C.}} UF_6.$$

The intermediate fluorides U_2F_9 ($UF_{4.5}$), U_4F_{17} ($UF_{4.25}$) and UF_5 are prepared by reaction of solid UF_4 and gaseous UF_6 under appropriate conditions of temperature and pressure.

Uranium hexafluoride is probably the most interesting of the uranium fluorides. Under ordinary conditions it is a dense, white solid with a vapour pressure of about 120 mm at room temperature. It can readily be sublimed or distilled and is by far the most volatile uranium compound known. Despite its high molecular weight, gaseous UF_6 is almost a perfect gas, and many of the properties of the vapour can be predicted from kinetic theory. Uranium hexafluoride is a strong fluorinating agent and is therefore corrosive; it is sensitive to traces of moisture and must be handled by special techniques.

Uranium tetrachloride can be prepared by direct combination of chlorine with uranium metal or hydride; it can also be obtained by chlorination of uranium oxides with carbon tetrachloride, phosgene, sulphur chloride or other powerful chlorinating agents. The trichloride as obtained by reduction of UCl_4 with hydrogen, and the higher chlorides by reaction of UCl_4 with chlorine Uranum pentachloride disproportionates on heating to UCl_4 and UCl_6. Uranium hexachloride is a rather volatile, somewhat unstable substance All of the uranium chlorides dissolve in or react readily with water to give solutions in which the oxidation state of the ion corresponds to that in the solid. All of the solid chlorides are sensitive to moisture and air

The bromides and iodides of uranium are obtained either by reaction of the elements or by treatment of UH_3 with the appropriate halogen acid. The thermal stability of the halides decreases as the atomic number of the halogen increases. No higher uranium bromides or iodides are known.

A series of oxyhalides of the type UO_2F_2, $UOCl_2$, UO_2Cl_2, UO_2Br_2, etc., are known. They are all water-soluble substances which become increasingly less stable in going from fluoride to iodide.

Aqueous Systems.—As mentioned above, aqueous solutions of U^{III}, U^{IV} and U^{VI} are readily obtained Solutions of U^{III} are blood-red in appearance; hydrogen is slowly evolved with the formation of U^{IV} solutions. Solutions of U^{IV} are quite stable in the absence of air. As may be judged from its potential, U^{IV} is a strong reducing agent and is easily oxidized to uranyl by oxygen, peroxide and numerous other oxidizing agents. Uranyl solutions in turn may be reduced to U^{IV} with sodium hydrosulphite, zinc or cadmium amalgam, or by electrochemical or photochemical means

No trivalent uranium compounds can be precipitated from U^{III} solutions; rapid oxidation to U^{IV} compounds occurs when such precipitations are attempted. Ordinarily only chloride or perchlorate solutions of U^{III} are encountered, although bromide, iodide and sulphate may be obtained.

The common water-soluble salts of U^{IV} are the chloride, bromide, sulphate and perchlorate. Solutions of these salts show a slight acid reaction which indicates a moderate degree of hydrolysis. The main absorption bands of U^{IV} solutions are at 650 mμ, 550 mμ, 495 mμ and 430 mμ. A number of different types of experiments indicate that in one molar acid, the U^{IV} ion is essentially U^{+4} (in the absence of complexing agents). Chloride and bromide ions form complex ions with U^{IV} only to a small extent in dilute solution; sulphate ion complexes U^{IV} more strongly. Insoluble U^{IV} oxalate, phosphate, fluoride, molybdate, arsenate, ferricyanide and hydroxide can be precipitated from U^{IV} solutions

Uranyl solutions are readily obtained and are more stable than those of any of the other oxidation states. Well known and extensively studied are uranyl nitrate, chloride, perchlorate, acetate, carbonate and sulphate systems. In many respects UO_2^{++} behaves like a simple doubly-charged ion. Solutions of UO_2^{++} have a characteristic yellow colour and

are slightly hydrolysed In concentrated solutions there is some evidence for the formation of polymerized ions such as UO_3^{++}. An interesting property of uranyl nitrate solutions known since the mid-19th century is extractibility with diethyl ether, uranyl nitrate hydrates are markedly soluble in ether. The addition of hydroxide, phosphate, ferricyanide, oxalate, etc., results in the precipitation of insoluble salts The uranyl ion has, however, a strong tendency to form soluble complex ions with an excess of carbonate or oxalate ions. In general, uranyl salts of weak acids have a marked tendency to form complex ions. Characteristic is the precipitation of double salts such as sodium uranyl acetate, $NaUO_2(C_2H_3O_2)_3$, and sodium magnesium uranyl acetate, $NaMg(UO_2)_3(C_2H_3O_2)_9.H_2O$. The latter type has considerable analytical significance. Uranyl solutions are fluorescent and undergo a great variety of photochemical reactions in the presence of organic compounds. URANUS, Heaven, in Greek mythology, the husband of Gē, and father of Cronus (*q.v.*) and other deities (*see* TITANS). As such he represents the generative power of the sky, which fructifies the earth with the warmth of the sun and the moisture of rain.

The Roman Caelus is simply a translation of the Greek *Ouranós* not the name of a distinct national divinity. In art, Uranus is shown as an old, bearded man holding a robe stretched out over his head in the form of an arch.

URANUS, in astronomy, the seventh major planet in the order of distance from the sun, and denoted by the symbol ♅. It was discovered by Sir William Herschel on March 13, 1781 He saw it as a round nebulous disc, slowly moving among the stars, and at first supposed it to be a comet, and announced it as such to the Royal Society A few weeks' observation, however, showed it to be moving in a nearly circular orbit at a distance from the sun about nineteen times that of the earth. Its planetary character was thus established, and Herschel named it the Georgium Sidus in honour of his royal patron. "The Georgian" was used in the *Nautical Almanac* up to 1850; but it was disliked outside England as was Herschel's name, proposed by Lalande. The name Uranus was proposed by Bode.

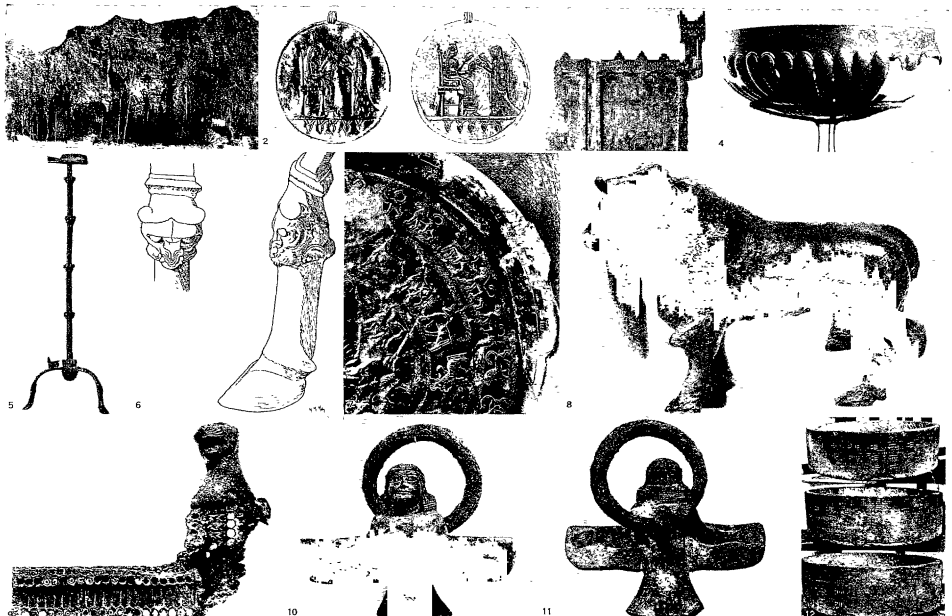
The mean distance of Uranus from the sun is 1,782,800,000 miles, and the time required for a revolution in its orbit just over 84 years The diameter has been found to be about 30,900 miles, and, since observations of the satellites show its mass to be 14·6 times that of the earth, its density is very low; viz., 0·25 that of the earth, and 1·36 times that of water The spectrum of the planet contains a number of strong absorption bands of as yet unknown origin, similar to those in the spectra of Jupiter, Saturn and Neptune. They are much more intense than those of Jupiter and Saturn, but less strong than those of Neptune. It is evident that Uranus is in the same physical state as the other planets of the outer group. Despite its distance from the sun Uranus, in consequence of its high albedo, shines as a star slightly brighter than the 6th magnitude. It is therefore, under favourable conditions, within the reach of naked eye vision Indeed, long before its discovery by Herschel, Flamsteed had taken it for a star. Lemonnier during the opposition of 1768–69 observed it eight times, but did not detect its planetary character.

Its disc, which is of a pale sea-green colour, has a diameter of rather less than 4″, and measurements by several observers have shown it to be definitely elliptical. A white streak has also been recorded crossing the centre and some faint dusky bands or belts have been noted, but it has not been possible to determine the period of its rotation in the usual way by observation of definite surface features. Spectroscopic observations, based on the Doppler principle (*see* LIGHT), by the late Professor Lowell and Dr. Slipher in 1912, however, indicated a rotation period of $10^h\ 45^m$, and photometric observations by Leon Campbell at Harvard have revealed variations of brightness, which might well be due to an outbreak of spots combined with axial rotation, in excellent accord with this value.

Satellites of Uranus.—In Jan. 1787 Herschel detected two satellites of Uranus of which the inner one, now known as Titania, had a period of 9 days, the outer, Oberon, of 13½ days. He also on other occasions saw what he supposed to be two additional satellites, but these objects could not have been of this character. In 1851–52 William Lassell at Malta, in conjunction with his assistant A Marth, observed two satellites yet nearer the planet than those of Herschel These are now known as Ariel and Umbriel Their periodic times are about 2½ and 4 days respectively Lassell's (telescopes, which were reflectors, were superior in light-power to others of his time, and these inner satellites were not seen by other astronomers for more than twenty years after their discovery Indeed, doubts of their reality were only resolved in 1873, when they were observed with the Washington 26-in telescope

The most remarkable feature about these satellites is the very high inclination of their orbit planes. This amounts to 98° to the plane of the planet's orbit, and 97·8° to the ecliptic, so that the motion of the satellites is really retrograde. The result of the high inclination is that, as Uranus revolves in its orbit, there are two opposite points at which the planes are presented edgewise to view, and the satellites will be seen to travel nearly north and south in the telescopic field. At intermediate points their orbits will appear circular. The former appearance last occurred in 1924, and the latter will next be seen in 1945.

The Satellites of Uranus



Satellite	Distance from Uranus in miles	Sidereal period	Stellar magnitude
		d. h m. s.	
i Ariel .	119,100	2 12 29 20·8	16
ii. Umbriel . .	165,900	4 3 27 36·7	16–17
iii Titania .	273,200	8 16 56 26·7	14
iv. Oberon .	364,000	13 11 7 3·5	13

For the irregularity in the motion of Uranus which led to the discovery of Neptune, *see* NEPTUNE.

URARṬU, the Assyrian name for the country called later on Armenia and for its inhabitants. It is identical with the country of Ararat, on one of whose mountains Noah's ark stopped, according to Genesis, the name survives in the Armenian province of Ararat and has been transferred to Mount Ararat south of the river Araxes. Herodotus's Alarodoi are the Urartaeans who after the immigration of the Armenians (after 600 B.C.) retained or formed a distinct nation in the valley of the Araxes. The inhabitants of Urarṭu, however, in their cuneiform inscriptions call themselves *Chaldini* (plural).

The writing of the cuneiform inscriptions of the Urartaeans was taken from the Assyrians, but whereas Assyrian is a Semitic language, Urartaean is neither Semitic nor Indo-European The Urartaeans or Chaldians must have immigrated from the west into what was then to a greater part called Nairi Apparently Sardur I., son of Lutipris, who built a fort to the west of the rock of Van, out of huge stones brought from afar, united the "Nairi-countries" under his rule after a long war against the Assyrians about the time of Assurnasirabal II, the father of Shalmaneser III This kingdom of Nairi was replaced by the kingdom of Urarṭu-Chaldia. Aram, who was the king of Urarṭu, was fought by Shalmaneser III. (859–824 B.C.), and so was his successor Sardur (Seduri II), father of King Ispuinis who chose the rock of Van for his residence and as the holy seat of the god Chaldis. Ispuinis was the contemporary of Adadnirari IV. of Assyria—son of Shalmaneser III. and husband of Queen Shammuramat, *i.e.*, the historical Semiramis—whom he fought successfully, these successes enabling him to found a Chaldian colony at Muṣṣair, west of the pass of Kelishina A bilingual Chaldian and Assyrian inscription was erected by Ispuinis upon this occasion.

Menuas, his son, was the mightiest and most successful of the Chaldian rulers. His greatest work is the aqueduct (the so-called Shamiram-su "river of Semiramis") more than 75 km. in length, irrigating the plain of Van to this day and bringing drinkable water to the eastern borders of Lake Van (whose water is undrinkable), thus enabling him to found a "Menuas-city." Menuas was succeeded by Argistis I, a son, who left records of 14 years of his reign and his successful wars, on the outer walls of the set of chambers hewn into the solid rock of Van. His son Sardur

REMAINS OF URARTU CIVILIZATION

1 Rock of Van Kalah showing rock chambers (to the left) and staircases, the former probably built during the fourteenth year of the reign of Argistis I. 2 Gold medal showing goddess and female worshipper; excavated at Toprak Kalah near Van in 1899 Photograph (left), and drawing (right), Berlin Museum. 3, Bronze model of wall with gate and tower. British Museum. 4 Bronze vessel inscribed with unknown signs Berlin Museum. 5 Candelabrum excavated in 1899 at Toprak Kalah, near Van. Gewerbe Museum, Hamburg. 6 Detail of foot of candelabrum, zoomorphic juncture: bull's foot coming out of lion's mouth. 7 Sacred shield adorning wall of Temple at Toprak Kalah with inscription of Rusas III British Museum. 8 Bronze bison; one of three chief races of big cattle living in Babylonia in the oldest times British Museum 9. Mythical animal Tiamat; holes partly filled with ornamental glass. British Museum. 10. Bronze vase handle in form of winged disc of the sun with goddess (front side) British Museum. 11. Reverse side of bronze vase handle in fig 10. 12. Stone vessel of King Ispuinis, founder of the fortress on the Rock of Van. (Three views.) British Museum.

III., contemporary of Assurnirari (755–745 B.C.) and of Tiglath-pileser III (745–727) of Assyria, was defeated by the latter, who destroyed the Manaus-city (735 B.C.).

Rusas I (714 B.C.), son of a Sardur, belonging to a side-line of the dynasty, removed the capital to a hill called Toprakkalah nowadays, after digging an artificial lake, the outflow of which irrigated the side of the hill and the plain where he founded the Rusas-city. All this he recorded in a *stela* set up only a few years after the traditional date of the founding of Rome (754 B.C.). It was taken (1898–99) to the Berlin museum Rusas I was a most energetic enemy of Sargon II of Assyria (722–705 B.C.) against whom he summoned a coalition of the states of Western Asia, of which Mardukabaladdin of Babylonia (the Merodach-Baladan of the Bible) probably was one. In a bilingual *stela* erected over against the capital of Musasir, which had developed into a sort of independent buffer-state, Rusas commemorated his feats against Assyria in re-establishing Chaldian sovereignty and the petty king Urzana in Musasir.

But in 714 the Cimmerians, breaking into the north of Urartu through the passes of the Caucasus, drove Rusas to suicide Sargon had made a raid into Urartu and on his return had conquered Musasir, robbing its temple and overthrowing and mutilating Rusas I's *stela*, which, however was later on re-erected, evidently by Rusas II, the grandson of Rusas I who once more restored the power of Chaldia Rusas II used Cimmerian mercenaries in his combats with Esarhaddon of Assyria (680–668 B.C.) and succeeded in getting rid of the bulk of the Cimmerians who went on to the west of Asia Minor. Rusas III, son of Erimenas, finished the temple of Chaldis on Toprakkalah Sargon's sculpture of the temple of Musasir shows its front adorned with ornamented shields, a custom which the Chaldians had in common with the Cretans of Minoan times Such shields, with inscriptions chiefly of Rusas III, were excavated in Toprakkalah. Their circular friezes are divided into semicircles upon which the animals are going in different directions so as to prevent any one appearing to stand on its head (fig. 7), a peculiarity only recurring on Cretan shields of the archaic period The royal residence at Toprakkalah and the temple of Chaldis were evidently destroyed under Rusas III. The Medes must have overrun Urartu before they crossed arms with the Lydians on the Halys (May 28, 585 B.C.).

The pottery excavated at Toprakkalah, apart from other peculiar features, partly shows in red, and sometimes in black, a glazed surface which is practically equal to "bucchero" The gold medal (fig. 2) showing a goddess of fertility and her female adorer in beaten work has peculiarities which have left their mark in archaic Greek, especially Ionic art. A candelabrum (fig 5) and parts of a throne with a baldachin show a wreath of falling leaves the latter in exactly the shape in which it (the forerunner of the *kymation*) appears on the eldest Ionian or pre-Ionian capitals The legs of the above mentioned candelabrum (fig 6) and of another one preserved in Erlangen show the "zoomorphic juncture," one member of an animal coming forth out of the mouth of the same or another animal: this feature being entirely restricted to the art of the Chaldians and of the Etruscans. The bronze vessel from Toprakkalah (fig. 2) with vertical rims has innumerable parallels in Etruscan tombs. The way the Chaldians built their walls and towers is illustrated by a model found at Toprakkalah (fig. 3). A very striking likeness of the bison, one of the three chief races of big cattle living in Babylonia in the oldest times, in bronze stressing the beard as its special feature (fig. 8) shows its existence in ancient Armenia in the first millennium B.C. The attaches or handle figures of big bronze vessels in the form of a female divinity in the winged disc of the sun (fig. 10) are a Chaldian speciality, recurring in archaic Greek and in Etruscan art. The bronze snake, probably Tiamat, the animal of the Chaos, shows, as do numerous other pieces, a combination of different materials, the holes, for example, being partly filled with coloured glass

The Chaldians must have come from more western parts of Asia Minor where they were in touch with elements of Minoan culture; their culture is principally western with only minor traces of Assyrian influence; they influenced archaic Greek art in their turn, and had peculiar relations to the Etruscans which were probably based on a former relatively close proximity. When the Armenians invaded Urartu, the Chaldians withdrew into the mountains keeping up their warlike spirit and their metallurgic accomplishments. They were also called Chalybes, probably from the name of the steel which they were the first to produce. The region south of Trebizond was one of the last resorts of the Chaldians. The Byzantine *thema* of this region was called Chaldia and an archbishopric of the Greek church about Gumushchana is called Chaldia to the present day

(C. F. L.-H.)

URBAN (Urbanus), the name of eight popes.

ST. URBAN, first pope of that name, was bishop of Rome from 222 to 230. Preceded by Calixtus, he was followed by Pontianus.

URBAN II (Odo or Otho or Eudes de Lagary), pope from March 12, 1088, to July 29, 1099, was born near Reims, became archdeacon of Auxerre, and later joined the congregation of Cluny, when he became sub-prior He was created cardinal-bishop of Ostia in 1078 by Gregory VII, to whom he displayed such loyalty, especially as papal legate in Germany (1084), that he was imprisoned for a time by Henry IV He was designated by Gregory as one of four men most worthy to succeed him, and, after a vacancy of more than five months following the decease of Victor III., he was elected pope on March 12, 1088, by an assembly of cardinals and others at Terracina. Throughout the major part of his pontificate he had to reckon with the presence of the powerful antipope Clement III (Guibert of Ravenna) in Rome He maintained an alliance with the Norman Duke Roger, Robert Guiscard's son and successor, and united the German with the Italian opposition to the emperor by promoting the marriage of the Countess Matilda with young Welf of Bavaria. He aided Prince Conrad in his rebellion against his father and crowned him king of the Romans at Milan in 1093. By excommunicating Philip I of France for matrimonial infidelity in 1095, Urban opened a struggle which was not terminated until after his death Invited to Tuscany by the Countess Matilda, he convoked a council at Piacenza in March 1095, attended by so vast a number of prelates and laymen that its sessions were held in the open air, and addressed by ambassadors of Alexis, the Byzantine emperor, who sought aid against the Mussulmans. Urban crossed the Alps in the summer, and remained over a year in France and Burgundy. He held a largely attended council at Clermont in November 1095, where he preached the First Crusade His sermon is printed in J. R. Watterich, *Pontif. Roman. Vitae* Crusaders on their way through Italy drove the antipope Clement III. finally from Rome in 1097, and established Urban firmly in the papal see. With a view to facilitating the crusade, a council was held at Bari in October 1098, at which religious differences were debated and the exiled Anselm of Canterbury combated the Eastern view of the Procession of the Holy Ghost. Urban died suddenly at Rome on July 29, 1099, fourteen days after the capture of Jerusalem, but before the tidings of that event had reached Italy. His successor was Paschal II.

See authorities quoted under PAPACY, also M. F. Stern, *Zur Biographie des Papstes Urbans II.* (Berlin, 1883); A de Brimont, *Un Pape au moyen âge—Urbain II.* (Paris, 1862).

URBAN III. (Uberto Crivelli), pope from Nov 25, 1185, to Oct 20, 1187, was a Milanese, and had been made cardinal-priest of St Lorenzo in Damaso and archbishop of Milan by Lucius III., whom he succeeded. He continued vigorously his predecessor's quarrels with the emperor, including the standing dispute about the territories of the Countess Matilda. His opposition to the pretensions of the Roman senate to govern the Papal States, moreover, compelled him to remain in exile through his pontificate He suspended the patriarch of Aquileia for crowning the emperor's son, Henry, king of Italy (January 1186), in violation of his own rights as archbishop of Milan, and only the entreaties of

the citizens of Verona, where he was stopping, prevented him from excommunicating Frederick. In 1187 he exhorted the Christian kings to renewed endeavours in the Holy Land, and the fall of Jerusalem (Oct 2) is said to have caused his death He died at Ferrara and was succeeded by Gregory VIII. His letters are in J. P Migne, *Patrol Lat.*, vol 202.

URBAN IV. (Jacques Pantaléon), pope from Aug. 29, 1261, to Oct. 2, 1264, was the son of a shoemaker of Troyes Having received a monastic education, he became archdeacon of Liége and papal legate of Innocent IV. to Poland and Prussia, he was consecrated bishop of Verdun in 1253, and two years later was translated to the patriarchate of Jerusalem. He was on a visit to Italy when he was elected to succeed Alexander IV. in the Holy See He spent most of his pontificate at Orvieto. Under him began that preponderance of the French in the curia which later led to the papal residence at Avignon, and indirectly to the Great Schism. In 1264 he instituted the festival of Corpus Christi. He favoured the claim of Charles of Anjou to the crown of the Two Sicilies. Urban died before the arrival of Charles of Anjou, and was succeeded by Clement IV

The registers of Urban IV. have been published by L. Dorez and J. Guiraud in the *Bibliothèque des écoles françaises d'Athènes et de Rome* (Paris, 1892).

URBAN V. (Guillaume Grimoard or Grimaud de Beauvoir), pope from Oct. 28, 1362, to Dec. 19, 1370, was born in 1309 near Lozère in Languedoc, and entered the Benedictine priory of Chiriac. He held many preferments, and was returning from a mission as papal legate to Italy, when he heard that he had been chosen to succeed Innocent VI. He was consecrated at Avignon Nov 6, 1362. Urban witnessed the completion of the work of tranquillising Italy under the able Cardinal Albornoz, and in 1364, in the interests of peace, made heavy concessions to Bernabo Visconti. Moved by Peter of Lusignan, king of Cyprus, and by the celebrated Carmelite Peter Thomas, who had come to Avignon in February 1363, the pope proclaimed another crusade, which found some echo in France and resulted in the temporary occupation of Alexandria (1365). Urban, yielding to the entreaties of the Emperor Charles IV. and of Petrarch, left Avignon on April 30, 1367, despite the opposition of the French cardinals, and made his entry into Rome on Oct. 16. The following year he was visited by Charles IV., and crowned the Empress Elizabeth (Nov. 1), and in 1369 he received the Greek emperor, John Palaeologus. Urban sanctioned the order of Jesuates and founded the medical school at Montpellier. He at length announced his intention of returning to France, avowedly to settle trouble between France and England. He arrived at Avignon on Sept. 24, 1370, died on Dec. 19 Urban was serious and humble, opposed to all nepotism, simony and secular pomp. He was himself of blameless morality and reformed many abuses in the curia. He was honoured as a saint immediately after his death, and beatified by Pius IX. in 1870. Urban's successor was Gregory XI.

See H. J. Tomaseth, "Die Register u Secretäre Urbans V. u. Gregors XI." in *Mittheilungen des Instituts für österreichische Geschichtsforschung* (1898).

URBAN VI. (Bartolommeo Prignano), pope from April 8, 1378, to Oct. 15, 1389, was born at Naples in 1318. He was made bishop of Acerenza in 1364, and in 1377 was translated to the archiepiscopal see of Bari and placed in charge of the papal chancery. On the death of Gregory XI., who had finally returned to Rome from Avignon, he was elected pope. Urban VI. turned his attention at once to the reformation of the higher clergy, and, in spite of the warnings of Catherine of Siena, so angered the cardinals by his harsh and ill-tempered measures that they assembled at Anagni in July 1378, and revoked his election, in which they declared they had acted under fear of violence. On Sept. 20, they elected at Fondi the Cardinal Robert of Geneva, who called himself Clement VII. and took up his residence at Avignon. Urban, on the other hand, remained at Rome, where he appointed twenty-six new cardinals and excommunicated Clement and his adherents Thus began the Great Schism which divided the Western Church for about fifty years. Urban deposed Joanna of Naples (April 21, 1380) for adhering to France and Savoy in support of the antipope, and gave her kingdom to Charles of Durazzo. Charles was crowned at Rome on June 1, 1381, but three years later quarrelled with the pope and shut him up in Nocera Urban escaped to Genoa, where he put several of his cardinals to death for suspected disloyalty. On the death of Charles he set out with an army apparently to seize Naples for his nephew To raise funds he proclaimed, by bull of April 11, 1389, a jubilee for every thirty-three years, but before the celebration could be held he died of injuries caused by a fall from his mule

The chief sources for the life of Urban VI. are in Baluzius, *Vitae Pap Avenion.* (Paris, 1693); *Theoderici de Nyem De schismate Libri tres*, ed. by G Erler (Leipzig, 1890), Sauerlande, "Actenstucke zur Gesch. des Papstes Urban VI.," in *Hist Jahrbuch der Gorres-Gesellschaft*, XIV. (1893), "Acta Urbani VI. et Bonifatii IX.," ed C Krofta. in *Monumenta vaticana res gestas Bohemicas illustrantia* (Prague, 1905); *Der Liber Cancellariae Apostolicae vom Jahre 1380*, ed. by G. Erler (Leipzig, 1888); *Il Trattato di S Vincenzo Ferrer intorno al grande scisma d'Occidente*, ed. by A. Sorbelli (Bologna, 1906). *See* also W. St. C. Baddeley, *Charles III. of Naples and Urban VI.* (1894); J. B. Christophe, *Histoire de la papauté pendant le XIVe siècle*, vol. 3 (Paris, 1853).

URBAN VII (Giovanni Battista Castagna), successor of Sixtus V, was born on Aug 4, 1521. He became governor of Bologna, archbishop of Rossano, and was long nuncio to Spain. Gregory XIII. made him a cardinal, 1583; and in 1590 he was elected pope by the Spanish faction, but died twelve days later, on Sept. 27, 1590, and was succeeded by Gregory XIV.

See Ciaconius, *Vitae et res gestae summorum Pontif. Rom.* (Rome, 1601-02); Cicarella, continuator of Platina, *De vitis Pontif Rom.* (both contemporary; the latter prolix and tedious); Arrigho, *Vita Urbani VII.* (Bologna, 1614); and Ranke, *Popes* (Eng trans., Austin), ii. 227.

URBAN VIII (Maffeo Barberini), pope from 1623 to 1644, was born in 1568, of a wealthy Florentine family. He early entered the prelacy, became prefect of Spoleto, twice nuncio to France, cardinal (1606), and finally, on Aug. 6, 1623, succeeded Gregory XV. as pope. Urban accepted the papacy chiefly as a temporal principality, and made it his first care to provide for its defence and to render it formidable He built Castelfranco on the northern frontier; fortified the port of Civita Vecchia; and strengthened the Castel Sant' Angelo, equipping it with cannon made from the bronze of the Pantheon, an act of vandalism which the Romans punished by the epigram, "Quod non fecerunt barbari, fecerunt Barberini." He also established an arsenal and a factory of arms But the only territory gained during Urban's pontificate, the duchy of Urbino, the last addition to the papal states, was acquired by reversion (1631); and in his one war, with the duke of Parma, for the district of Castro, he met defeat and humiliation (1644). The Thirty Years' War Urban professed to regard as waged for political, not for religious, ends. He therefore threw in his lot with France, supported the duke of Nevers in the Mantuan Succession, and, under stress of fear of Habsburg supremacy, suffered himself to be drawn into closer relations with the Protestants than beseemed his office.

Urban was the last pope to practise nepotism on a grand scale. He failed to found a princely house; but he enriched his family to an extent that astonished even the Romans Urban bore a hand in the condemnation of Galileo He acknowledged the genius of the astronomer, and had not approved of the action of the Inquisition in 1616; but subsequently, believing himself to have been caricatured in the *Dialogo*, he permitted the Inquisition to have its way and to compel an abjuration (1633). Urban also denounced the doctrines of Jansen, 1644 (*See* JANSENISM.) He promulgated the famous bull *In Coena Domini* in its final form, 1627; published the latest revision of the Breviary, 1631; founded the College of the Propaganda for the education of missionaries, 1627; and accorded the title of "eminence" to the cardinals, 1630. Urban did much to embellish the city. Conspicuous among his works are the Barberini Palace, the College of the Propaganda, the Fountain of the Triton, and the baldachin of St Peter's. His hymns and poems, which have frequently been published, are evidence of his literary taste and ability. Urban died on July 29, 1644, and was succeeded by Innocent X.

For contemporary accounts of Urban *see:* Tommasucci, in Platina, *De vitis Pontif. Rom*; Oldoin, continuator of Ciaconius, *Vitae et res gestae summorum Pontif. Rom.*; and Simonin, *Gesta Urbani* (Antwerp.

1637) A rich collection of materials was made by Andrea Niccoletti, *Della vita di Papa Urbano VIII, e storia del suo pontificato*, never published, but extensively used by Ranke and others *See also* Gregorovius, *Urban VIII im Widerspruch zu Spanien u. dem Kaiser* (Stuttgart, 1879), and Weech, *Urban VIII* (London, 1905)

URBANA, a city of eastern Illinois, U.S. Pop. 23,007 in 1950. Urbana and the adjoining city of Champaign (*q.v.*) are separately incorporated, but together form a population centre of 62,404. Urbana is the seat of the University of Illinois (*q.v.*).

URBANA, a city of Ohio, U S, the county seat of Champaign county. Pop. (1950) 8,439 It is the seat of Urbana university (Swedenborgian), a junior college founded in 1850. Urbana was founded in 1797 by Col William Ward, of Greenbriar, Va., who owned the land and gave many lots to the city on condition that the proceeds from their sale should be used for public improvements. The village was incorporated in 1805 and was chartered as a city in 1867.

URBANIZATION. The growth of cities was characteristic of modern industrial society, particularly after 1800. It arose largely as a result of the in-migration of population from rural areas, where the rate of natural increase has always been higher than in the cities. The fundamental economic reasons for this movement are manifold, including the change from hand to power-driven machines (as in the textile industry in England), and the growth of specialization in manufacturing, which tended toward the establishment of large production units. Specialization in production progressed so far, even in agriculture, that most farmers, in the U.S., at least, came to produce mainly one or a very few products for the market and to purchase most of their needs in the market—in contrast with the old-time almost self-sufficing family farm.

World Population.—The changes in the urban-rural distribution of population have been recorded, in some fashion, in most of the later censuses taken in various parts of the world. Unfortunately for one who wishes to make close comparisons, the definition of what constitutes urban population has not been by any means uniform as between one country and another. The most inclusive definition of urban population was that employed in Iceland, where all places of 300 inhabitants or more were counted as urban, and among the least inclusive definitions was that of the Netherlands, where a city had to have a population of 20,000 or more to be classified as a part of the urban area. The population of the world in 1949 was estimated at 3,270,453,000. The approximately 50 nations that obtained figures for urban population in later censuses had an aggregate population of about 1,138,000,000, of which about 409,000,000 or 36.0% were classified as urban.

United States.—As defined by the censuses up to and including 1940, urban territory in the United States was made up mainly of incorporated places having 2,500 inhabitants or more. The

TABLE I.—*Total and Urban Population of Selected Countries* (Census dates ranging from 1930 to 1951)

Country	Date	Population			Basis of urban classification
		Total	Urban		
			Number	Per cent	
EUROPE					
England and Wales	1931	39,952,377	31,951,918	80.0	County boroughs and other urban districts
Scotland	1931	4,842,980	3,879,936	80.1	Places having 1,000 inhabitants or more
Northern Ireland	1951	1,370,745	671,545	52.9	County boroughs and other urban districts
Ireland (Eire)	1951	2,960,593	1,227,393	41.5	Towns having 1,500 inhabitants or more
Norway	1950	3,278,546	1,054,820	32.2	Cities or towns officially designated as urban
Sweden	1945	6,673,749	2,822,487	42.3	Cities or towns with urban administration
Denmark	1945	4,045,232	1,947,838	53 3	Cities and towns
Iceland	1950	143,961	104,734	72.8	Towns of 300 inhabitants or more
Netherlands	1946	9,494,214	5,138,100	54.1	Municipalities of 20,000 inhabitants or more
Belgium	1930	8,092,004	4,893,683	60.5	Administrative subdivisions of 5,000 inhabitants or more
Luxembourg	1947	286,786	166,671	58.1	Communes having more than 2,000 inhabitants in chief town
Switzerland	1941	4,265,703	1,402,335	32.9	Communes having more than 5,000 inhabitants
France	1946	40,502,513	21,551,420	53.2	Communes having more than 2,000 inhabitants in chief town
Germany					
British zone	1946	21,804,099	17,175,184	78.4	Administrative subdivisions with more than 2,000 inhabitants
French zone	1946	5,029,342	2,558,404	50 9	Administrative subdivisions with more than 2,000 inhabitants
U.S. zone	1946	8,738,412	4,733,568	54.4	Administrative subdivisions with more than 2,000 inhabitants
Poland	1946	23,929,800	7,459,400	31.2	Communities with urban administration
Czechoslovakia	1947	12,164,661	5,935,433	48.8	Administrative districts having 2,000 inhabitants or more
Austria	1946	6,818,593	4,384,103	64 3	Self-governing units of more than 2,000 inhabitants
Hungary	1941	9,316,613	3,328,949	35.7	Administrative towns
Yugoslavia	1948	15,751,935	2,555,638	16.2	Administrative units governed by city committee
Finland	1947	3,849,097	956,302	24.8	
Rumania	1948	15,872,624	3,713,139	23.4	Cities and towns under urban administration
Greece	1940	7,344,860	2,618,075	35.6	Municipalities and communes having 5,000 inhabitants or more in chief town
Italy	1936	42,993,602	19,184,352	44.6	Communes with less than 50% of active population engaged in agriculture
Portugal	1950	8,441,312	*	*	Places of 2,000 inhabitants or more
Spain	1950	27,976,755	16,935,624	60.5	Places of 2,000 inhabitants or more
Trieste	1936	343,100	282,292	82.3	Communes with less than 50% of active population engaged in agriculture
NORTH AMERICA					
Continental U.S.	1950	150,697,361	96,440,528	64.0	Places of 2,500 inhabitants or more and suburban area around cities of 50,000 or more
Puerto Rico	1950	2,210,703	895,000	40.5	Places of 2,500 inhabitants or more
Canada	1941	11,506,655	6,252,416	54.3	Incorporated cities, towns, and villages
Mexico	1940	19,653,552	6,896,669	35.1	Places (localidades) of 2,500 inhabitants or more
Guatemala	1940	3,283,209	877,835	26.7	Cities, towns, and villages
Honduras	1950	1,368,605	424,453	31 0	Administrative centres of municipalities
El Salvador	1950	1,855,917	675,619	36.4	Populated centres
Panamá	1940	622,576	210,525	33.8	Towns of 1,500 inhabitants or more
Cuba	1943	4,778,583	1,834,340	38.4	Cities of 5,000 or more
Dominican Republic	1935	1,479,417	266,565	18.0	Capitals of districts, etc.
Leeward Islands	1946	108,838	23,159	21.3	The two cities
Windward Islands	1946	251,671	43,173	17.1	Towns, including some down to "1,000 or more"
SOUTH AMERICA					
Venezuela	1941	3,850,771	1,165,910	30.3	Places (lugares) of 2,500 inhabitants or more
Colombia	1938	8,701,816	2,533,680	29.1	Places of 1,500 inhabitants or more which are capitals of municipalities or districts
Brazil	1940	41,236,315	12,880,182	31.2	Principal towns of districts and their suburbs

TABLE I.—*Total and Urban Population of Selected Countries—Continued*
(Census dates ranging from 1930 to 1951)

Country	Date	Population			Basis of urban classification
		Total	Urban Number	Urban Per cent	
Peru	1940	6,207,967	2,107,133	35.4	Capitals of departments, provinces and districts
Argentina	1947	16,105,214	9,894,951	61.4	Cities, towns, or villages of 2,000 inhabitants or more
Chile	1940	5,023,539	2,633,479	52.4	Places of 1,000 or more
AFRICA					
Egypt	1937	15,920,694	4,002,406	25.1	Administrative centres and chief towns of provinces and districts
Union of South Africa	1946	11,391,940	4,144,983	36.4	Towns and villages with local self-government
Belgian Congo	1947	10,804,761	1,705,171	15.8	Populated centres with 100 or more nonindigenous inhabitants, etc.
ASIA					
Ceylon	1946	6,657,339	1,023,042	15.4	
India	1941	388,997,955	49,696,053	12.8	Cities and urban towns of 5,000 inhabitants or more
Japan	1950	83,199,637	31,203,191	37.5	Municipal administration areas—approximately cities of 30,000 or more
Korea	1944	25,000,142	1,951,566	7.5	The 12 incorporated cities
AUSTRALASIA					
Australia	1947	7,580,820	5,209,895	68.7	Capital cities and other cities separately incorporated
New Zealand	1945	1,702,298	1,024,292	60.2	Cities, boroughs and towns of 1,000 inhabitants or more
Total (all countries listed)		1,167,381,512	414,745,765	35.5	

*Totals do not include Portugal, figures for which were not available.

percentage of the population classified as urban, in accordance with this definition, increased from 5.1% in 1790 to 15.3% in 1850 and then more rapidly to 51.2%, or more than one-half, in 1920 and to 56.5% in 1940. If the same definition had been applied in 1950, the percentage would have been about 59.0

A new definition was adopted, however, for the 1950 census. This definition included also in the urban classification the thickly-settled urban area, or "urban fringe," around each city of 50,000 or more, and a considerable number of unincorporated places which had a population of 2,500 or more, but which were excluded from the earlier definition because of their lack of municipal incorporation. Under the new definition the urban population, including these added areas, amounted to 64.0% of the total.

TABLE II.—*Population of U.S. in Groups of Urban Places Classified by Size: 1950*
(All population figures are preliminary)

Size of places	Number of places	Population	Per cent of	
			Total population	Urban population
Total population, including rural (preliminary)	..	149,855,592	100.0	.
Total urban	.	95,891,539*	64.0	100.0
Urban places	4,270	87,992,647	58.7	91.8
Places of 1,000,000 or more	5	17,302,538	11.5	18.0
Places of 500,000 to 1,000,000	13	9,110,922	6.1	9.5
Places of 250,000 to 500,000	23	8,131,010	5.4	8.5
Places of 100,000 to 250,000	65	9,410,440	6.3	9.8
Places of 50,000 to 100,000	125	8,826,709	5.9	9.2

Places of 10,000 to 25,000	780	11,962,110	8.0	12.5
Places of 5,000 to 10,000	1,174	8,123,192	5.4	8.5
Places of 2,500 to 5,000	1,839	6,481,676	4.3	6.8
Other urban territory inside urban fringe	..	7,898,892	5.3	8.2

*A semifinal figure, involving an estimated distribution of the supplementary returns, sets the urban population of the United States at 96,440,528, which is 64.6% of the final total population of 150,697,361

In 1820 there was only 1 city with more than 100,000 inhabitants in the United states; in 1850 there were 6, of which 1 had more than 500,000; in 1880 the first city reported a population of 1,000,000 or more and there were 19 other cities of more than 100,000; in 1910 there were 3 cities of 1,000,000 or more, and 50 all together with more than 100,000; and in 1950 there were 5 with more than 1,000,000 and 106 with more than 100,000.

(L. E. T.)

URBINO, a city of the Marches (*Urbinum Metaurense*), Italy. Pop. (1936): 5,450, town; 22,248, commune. It is picturesquely situated on an abrupt hill 1,480 ft. above sea-level; its streets are narrow and crooked, and the town has a mediaeval aspect. It is dominated by the ducal palace erected by Luciano da Laurana, a Dalmatian architect, in 1465–82, for Federigo Montefeltro (well represented in a picture by Justus of Ghent in the gallery), and regarded by the contemporaries of the founder as the ideal of a princely residence. The monumental staircase, sculptured doorways, chimneys and friezes of the interior are especially fine. Some are by Domenico Rosselli of Florence. The rich intarsia work of the Duke's study is by Baccio Pontelli.
